A. The water that we use in the boilers we pump from the river and the water for cooling purposes is pumped from wells drilled along the bank of the river—the edge of the river.

5567 Q. These wells that you speak of from which you get your water for feeding purposes are driven wells, aren't they?

A. We have one open well and several driven wells.

Q. Now with reference to the source of the water suplying those wells, what is the difference between open and driven wells?

A. I think perhaps it is the same.

Q. An open well is a living well?

A. What do you mean by living well?

Q. Well, it don't depend on rains for its supply like a cistern?

A. No sir, it is supplied by water filtered through the gravel.

Q. Now where do you get the water that you feed your cattle; that you furnish the cattle for drinking purposes?

A. We don't give them much water; we give them the slop.

Q. Well if you give them any it comes from these wells?

A. From the river and from the wells; I don't know how to discriminate between the two.

Q. But you aim to get the water from these wells?

A. Well we use the well water for cooling purposes, because it is cooler; the water that goes to the sheds is overflowed
water; some of it is overflowed after it has done its work
5568 in cooling; some of it has overflowed from the cold stor-
age tank—cold water storage tank.

Q. You feed no cattle that are not healthy and sound?

A. No sir

Q. Do you feed them any deleterious foods of any kind?

A. No sir

A. Nothing but the products of the distillery?

A. That's all; and hay, and at times they are fed some cootton-seed meal.

Q. Does this offal from the cattle get to the river by means of a sewer? In other words, is it conveyed from the cattle by a sewer?

A. Yes sir.

Q. What is the character of that sewer, Mr. Wilson?

A. It is a wooden sewer.

Q. Is the mouth of the sewer below or above the surface of the water in the river?

A. It is above.

Q. I understand you to say that this offal from the cattle does not empty directly into the Illinois river, but that it emptied on a piece of low ground?

A. Yes sir.

Q. How far is the mouth of the sewer from the
5569 bank of the river; from the water's edge, in an ordinary
stage of water?

A. Oh, I should judge it was 100 feet now.

Q. Does the sun strike it before it gets to the water in the river?

A. Yes sir.

Q. It becomes very dry, doesn't it?

A. Yes.

Q. And that is true at all seasons of the year, except during extremely high water?

A. Yes sir.

Q. Is there any other substance or material passing through the sewer from your distillery to the banks of the river other than that which comes from the cattle which you feed in the distillery and the washings from the distillery?

A. No sir; it is built for the special purpose of taking away that offal.

Q. Now that sewer has been constructed for several years?

A. Yes sir.

Q. And has remained in the same place and the discharge from the sewer has been in the same place for the last ten or twelve years, has it not?

A. Not quite; no, we have gradually been filling up and moving it out further each year. I suppose that sewer has been lengthened out probably a couple of hundred feet in the
5570 last ten years.

Q. So that the mouth of the sewer is now about how many feet from the river, did you say?

A. About 200 feet, I should judge.

Q. Well you mean 200 feet from the water's edge?

A. No, I didn't say that. The sewer has been lengthened out probably 200 feet.

Q. The mouth of the sewer is now how many feet from the water's edge at ordinary stage?

A. I should judge 100 feet at this present stage of the water.

Q. You spoke, Mr. Wilson, of there being some acids of some kind discharged from the glucose factory; do you know from your personal knowledge that they do use acids to any considerable extent?

A. No, I do not. E. W. WILSON.

5571 Pekin, Illinois, July 22, 1903.

FRANK MILLER,

called as a witness in behalf of the defendants, being first duly sworn by the Commissioner, was examined in chief by Mr. Todd, and testified as follows:

Q. What is your name?

A. Frank Miller.

Q. Where do you live, Mr. Miller?

A. I live in Pekin, Illinois.

Q. Mr. Miller, did you take water for Mr. Jansen?

A. Yes sir.

Q. And you took it at the same places that he took it?

A. Yes, at the same place; I took it before he took it.

Q. Did you take water up at Wesley?

A. Yes sir.

Q. And did you take water above Peoria bridge, below the distilleries?

A. Yes sir.

Q. Where are the two places that you took it?

A. At Wesley and Mackinaw here, between Mackinaw and the still house.

Q. When you took the water, did you put any cards on
5572 the samples?

A. Yes sir, I put a card on the bottle, packed it up and took it to the express company.

Q. Did you put a card like that on each bottle? (Showing the witness Sanitary District's Exhibit 9 for identification).

A. On each bottle. I had a little bottle and a big bottle.

Q. How did you put the water in the bottles?

A. Went out with a skiff to the center of the channel; I took the cork out of the botle and put the bottle down that much (indicating) under water and I put the stopper in with the other hand under the water.

Q. Did you take the cork out of the bottle under the water?

A. No I took it out on top of the water.

Q. Did you rinse the bottle?

A. Yes sir.

Q. Did you cork the bottle under the water?

A. Yes sir.

Q. Did you pack the bottles in ice?

A. Yes sir.

Q. And put a card like the one I showed you on each bottle?

A. Yes, on each bottle.

Q. Now where did you ship the samples to?

A. One box I shipped to Champaign by the American Express; one box we shipped that went by the Union Express and one bottle to the University of Chicago that went by the Union Express.

Q. And where did you ship the other box?

A. We shipped three boxes.

5573 Q. Where did you ship the third box?

A. One to the Board of Health of the city of Chicago; one to the State University and one to the University of Chicago.

Q. How long would these bottles be out of the water before they were shipped by the express company?

A. Sometimes two hours; sometimes six hours. I had to go to the train to Wesley.

Q. What years did you collect this water in?

A. I don't know that; two or three years ago; I guess the card shows; yes, three or four years ago.

Q. What was the year?

A. 1899 and 1900.

Q. Who were you collecting these waters for?

A. For Jansen. I made the cards in his name.

CROSS-EXAMINATION, by Mr. Jeffries.

Q. What is your occupation?

A. I keep a boat-yard with skiffs for rent and have lived there for fifteen years; live right on the water.

Q. Are you a married man?

A. No sir, single man.

Q. Where did you take these samples, did you say?

5574 A. At Wesley?

Q. Whereabouts in Wesley?

A. Oh, about 200 yards or 300 yards above Wesley, in the center of the river in the channel.

Q. Where did you take the samples down here at the distillery?

A. Below the distillery, between the distillery and the Mackinaw in the center of the river.

Q. Did you rinse the bottles out?

A. Yes sir.

Q. How did you do that?

A. Set them up straight, reached down with my hand the bottle and rinsed it out; took the water and then I put my hand down under the water four or five or six inches and put the stopper down to it under the water; that is the way I was told and I done it that way.

Q. Who did you say you took the samples for?

A. Jansen.

Q. You said a moment ago that he discharged you, why did he do it?

A. Well he was away working on a bridge and after he got through with the work he didn't have anything to do so he wanted to take the water himself. That's all there is to it.

FRANK MILLER.

5575 Pekin, Illinios, River, July 22, 1903.

WM. J. CONZELMAN,

called as witness in behalf of the defendants, being first duly sworn, was examined in chief by Judge Johns and testified as follows:

Q. State your name, residence and occupation?

A. William J. Conzelman; one of the managers of the Globe Distillery, and also mayor of the town of Pekin, Illinois.

Q. What is the water supply of the city of Pekin.

A. The water supply is obtained by means of drive wells; pumped into a tank or water tower and afterwards distributed about the town.

Q. How extensive are the water pipes distributed through the town?

A. I think about seventeen miles.

Q. What proportion of the inhabitants of Pekin take water from the public supply?

A. About eighty per cent.

Q. Is there a system of sewers in the town?

A. There is; one main sewer extending up First Street about three-eighths of a mile and numerous laterals connecting therewith, constituting a sewer system of about two miles.

5576 Q. What number of inhabitants have connection with the sewer system?

A. About five per cent.

Q. What is the population of the town?

A. Between nine and ten thousand.

Q. How is the remainder of the household sewage in Pekin disposed of?

A. By means of cess-pools.

Q. Is the water supply of Pekin considered good as to the quality of the water?

A. Very good.

Q. What has been the condition in Pekin during the last three years and a half as to typhoid fever?

A. Normal.

Q. Have there been many or few cases?

A. Why, about the general average, I presume about twelve cases a year.

Q. How many cattle are fed yearly in the distillery of which you are manager?

A. About 4,500.

Q. Has the distillery been running continuously since January, 1900?

A. It has.

5577 Q. What is the estimated daily ejected matter from a single animal, urine?

A. That is a rather difficult question to answer.

Q. What is your estimate of it; how many gallons of urine and pounds of manure?

A. Why I think, from hearsay, about eight gallons of one and about half as much of the other.

MR. JEFFRIES: I move that the answer be stricken out because based upon hearsay testimony, and is not the best of evidence.

Q. With what are the animals fed?

A. With slop and rough feed, such as hay and cotton-seed hulls; also some little salt.

Q. About how much salt are they given daily?

A. About a quarter of a pound to each steer; each head of cattle

Q. How is the offal from the cattle disposed of?

A. By means of a slough or sewer into the river.

Q. Is it washed out with water?

A. It is.

Q. Are the cattle bedded down in the Globe Distillery sheds?

A. No sir

Q. Ordinarily, when a steer is put upon distillery food, how long is he kept in the sheds until he is ready for market?

A. The time varies a little. About eight months.

5578 Q. Are any cattle ever fed outside of the sheds of the Globe Distillery?

A. There are occasionally a few that become sore and are turned out into the yard.

Q. How many on an average would you say, during a year?

A. About forty, something like that; forty or fifty.

Q. What becomes of their offal?

A. It accumulates in the yard and is subsequently carried off to the river bank.

Q. After the stuff is carried to the river from the cattle shed, does it form what you call an island?

A. There is an accumulation or mass which we often term an island, yes.

Q. What becomes of this mass?

A. Usually with the high water in the spring it is taken away; and if not we assist by running a boat into it or something, to loosen the matter.

Q. When it is loosened does it float on the current of the river?

A. Yes sir.

Q. How large a mass is detached each year and floated in the Illinois river?

5579 A. A season's accumulation would aggregate a space of about a hundred feet square.

Q. And how deep?

A. About three to four feet.

Q. Is this mass under cover or is it exposed to the air?

A. It is exposed to the air.

Q. Has this condition been continuous at the Globe Distillery during the last three years or not?

A. Yes sir.

CROSS-EXAMINATION, by Mr. Jeffries.

Q. How long have you been connected with the business here?

A. Since 1892.

Q. You have fed about the same number of cattle from 1892 to 1900, and from 1900 down to the present day?

A. Yes sir.

Q. And consumed about the same amount of corn?

A. Yes sir.

Q. And manufactured about the same amount of whiskey?

A. Yes sir.

Q. The offal from these cattle and the washings from the distillery are emptied in the same place as they are now emptied and have been since January, 1900?

A. Yes sir.

5580 Q. The sewer through which this offal from the cattle and the washings from the distillery flow, is what is known as an open sewer, is it not?

A. Yes sir.

Q. With its mouth above the surface of the water at its ordinary stages?

A. Yes sir.

Q. Does it empty directly into the river or on the banks of the river?

A. It empties directly into the river.

Q. And accumulates there until there is sufficient current to carry it away?

A. Yes sir.

Q. Do you feed anything in your pens but healthy cows?

A. Nothing but healthy cows.

Q. Now you spoke of certain instances where cattle became sore; in what way would they become sore and be removed from the pens to the yard?

A. Cattle very frequently become foot-sore; their hoofs become inflamed and whenever that condition exists, we take them out into the yard and the contact of the hoof with the earth seems to take out the fever, etc.

Q. There is no eruption of the skin or anything of that kind?

A. No sir.

5581 Q. Do you use any chemicals in your distillery in the manufacture of whiskey from corn?

A. No sir

Q. Where do you get the water that you use in the distillery?

A. From drive wells.

WM. J. CONZELMAN.

5582 Pekin, Illinois, July 22, 1903.

HARRY TAYLOR,

called as a witness in behalf of the defendants, being first duly sworn by the Commissioner, was examined in chief by Judge Johns, and testified as follows:

Q. State your name, residence and occupation?

A. Harry Taylor, residence Pekin, occupation fisherman.

Q. How long have you been a fisherman?

A. Since 1895.

Q. Over what part of the river have you fished?

A. I have fished from Lake Depew to LaGrange dam.

Q. Where is Lake Depew?

A. Well, I should judge it is about twelve miles above Hennepin.

Q. When did you fish at Lake Depew and above Peoria on the Illinois river?

A. I fished at Lake Depew two years ago.

Q. Did you fish at any other point on the Illinois river between there and Peoria?

A. Yes sir, I have fished all the way to Peoria.

Q. Have you fished in the Illinois river above Peoria before the opening of the drainage canal in 1900?

A. Yes sir.

5583 Q. What was the condition of the river above Peoria before the opening of the drainage canal?

A. Well, the water is more pure and clearer now.

Q. Before the opening of the drainage canal; before it was opened, what was the condition of the water in the Illinois river above Peoria?

A. It was good water.

Q. Since the opening of the drainage canal, what has been the condition?

A. It is good water yet.

Q. Is it better or worse than before the opening of the drainage canal—above Peoria?

MR. JEFFRIES: Objected to as leading and suggestive.

A. It is better.

Q. What was the condition of the water in the Illinois river below Peoria before the opening of the drainage canal?

A. Well, to speak it plain, it was rotten.

Q. What kind of material was in it?

A. Why, it is slimy.

Q. Did the slime catch on your nets?

A. Yes sir.

Q. What was the condition of the Illinois river at Pekin before the opening of the drainage canal?

A. At Pekin it was just the same as it was below Peoria.

5584 Q. Was there a smell to the water?

A. Yes sir.

Q. Since the opening of the drainage canal, what has been the condition below Peoria?

A. It has been more pure.

Q. At Pekin is the slime—does the slime now form on the nets as it did before the opening of the drainage canal?

MR. JEFFRIES: Objected to as leading.

A. Yes sir, but not so bad as it was before.

Q. Since the opening of the drainage canal does the slime increase or decrease as you go down the river from here?

A. Why, it decreases.

CROSS-EXAMINATION, by Mr. Jeffries.

Q. How old are you?

A. Twenty-seven.

Q. And you have been fishing how many years?

A. Since 1895.

Q. The current in the river is very much stronger now than it was before the canal was opened, is it not?

A. Oh, it is some.

Q. Well, how much, if you know?

A. Well, I don't believe there is a mile.

Q. There is a better curent throughout the year, isn't
5585 there than there was before the canal was opened?

A. Oh, yes, there is some.

Q. You say the water is clearer now than it was before the canal was opened.

A. Yes, below Peoria.

Q. And how is it above Peoria, worse?

A. Better if anything.

Q. Not as clear?

A. Yes sir, clearer, like the water of Lake Michigan; blue like the water of Lake Michigan.

Q. You don't know whether the water contains any deleterious matter or not?

A. On what parts of the river?

Q. Any parts of the river that you are acquainted with?

A. It does below Peoria.

Q. What causes it?

A. Well those sugar houses and one thing and another dumps their offal into it.

Q. Do you know whether the sewage from Chicago comes in the river above Peoria?

A. No, I don't know.

Q. You don't take that into consideration when you say the water is purer; in other words, you don't know what effect that would have on it?

5586 A. Why yes.

Q. You know what effect it would have on it, do you?

A. Yes sir.

Q. What effect does sewage from Chicago have on the water?

A. Yes sir.

Q. Do you undertake to say that you have analyzed the water?

A. No, I never analyzed it.

Q. Then you don't know what it contains, do you?

A. Why, not according to that I don't.

Q. You don't think the offal from nearly 2,000,000 of people would have any effect on the water in the drainage canal, do you?

A. I never seen any of it.

Q. And because you never saw any of it, you don't think that it hurts the water?

A. No, not in my estimation.

Q. That is what you mean by it?

A. Yes sir.

HARRY TAYLOR.

5587 Pekin, Illinois, July 22, 1903.

J. C. LOSCH,

called as a witness in behalf of the defendants, being first duly sworn by the Commissioner, was examined in chief by Mr. Todd, and testified as follows:

Q. What is your name?

A. J. C. Losch.

Q. What is your business?

A. Steamboating.

Q. In what capacity?

A. I run a little boat of my own here; have for twelve or fifteen years.

Q. What is the name of it?

A. Steamer Olive A.

Q. How long have you been on the river, Captain?

A. About fifteen years.

Q. What was the condition of the Illinois river at this point before the opening of the drainage canal?

A. Why, in the summer time it was in bad condition.

Q. In what way?

A. By the water being foul.

Q. How did the foulness manifest itself?

5588 A. Well by smelling and killing the fish.

Q. Did you ever see any fish killed?

A. By the water?

Q. By the water?

A. Yes sir.

Q. To what extent and where?

A. Well I have seen them between here and the locks that my steamboat wouldn't have carried them, laying on the shore; been killed probably the night before.

Q. About how many fish would that be?

A. I suppose the boat would carry about ten or fifteen tons.

Q. Would there be that much fish dead there that you saw?

A. Yes sir.

Q. When was that, Captain?

A. It was somewhere along about 1889 or 1891; I can't just exactly tell; but it was along that time; before I bought my big boat.

Q. Were you acquainted with the water above Peoria?

A. I am some.

Q. How did the water above Peoria compare with the water below Peoria before the opening of the drainage canal?

A. Well, it has always been better above Peoria than it has been below.

5589 Q. Since the opening of the drainage canal, what has been its effect upon the waters of the Illinois river?

A. Well, I think they are better.

Q. In what way, Captain?

A. Well, they seem to be purer; there don't seem to be as much smell, nor look as bad.

Q. Have you seen any dead fish to the extent that you saw before the opening of the canal?

A. Nothing like I have saw before.

Q. Is there any smell on the waters now between here and Peoria?

A. Yes sir.

Q. How does it compare with what existed before the opening of the canal?

A. Well it is not as bad; if you will allow me to put in a little word of my own here; years ago every time we went from here to Peoria, every two or three trips, we had to blow out our boilers; we don't have to do that now; the boiler would foam and raise up from the filth and gas between here and Peoria.

Q. By blowing out your boilers, you mean washing your boilers?

A. Wash out the boilers.

Q. How does the river get as you go away from Peoria towards Grafton?

A. Better.

5590 Q. Have you ever seen any of these islands of manure in the Illinois river?

A. Yes sir, I have struck them big enough that if I had hit them fair they would take me down the river, with the little boat.

Q. Where do these islands of manure come from?

A. Peoria, those that I have reference to.

Q. Have you had anything to do with breaking off the manure at the different distilleries?

A. I have.

Q. Tell what it was?

A. Right here at Pekin I had clearing out the distilleries here; the manure would be five or six feet deep and covered probably an acre that I tore out for them; they paid me $25.00 for tearing it out.

Q. Was that the only place you had anything to do with removing the manure?

A. That is the only place I have had to clean it out. The Peoria distilleries paid me for taking it out of the canal above Spring Lake Canal, and the still house here and the Peoria

5591 parties paid me for taking it out of the canal.

Q. How did the manure get into the canal?

A. Floated down from Peoria and got into the canal and stopped up the canal.

CROSS-EXAMINATION, by Mr. Jeffries.

Q. What canal?

A. Spring Lake canal.

Q. You see some dead fish on the river now, don't you?

A. Very few.

Q. Some seasons of the year they are considerable?

A. Not lately.

Q. What is the current of the river now compared to what it was before the canal was opened?

A. Well I think it is a little stronger; the higher the river the stronger the current.

Q. Considerably stronger, isn't it?

A. Well it is not so very much; we haven't got a very strong current at no time here, even during the high water, we haven't got a terrible current, and at low water, as near as I can judge, less than half a mile or a third of a mile an hour. And in high water, I believe about three or four miles an hour.

5592 Q. You have more than a third of a mile now?

A. Well, I don't know; I don't think it would be much more than half a mile an hour now. .

Q. The current is much swifter here opposite Pekin?

A. Much swifter than what?

Q. Than it was before the opening of the canal?

A. Oh yes, the higher the water the swifter the current; it has always been, we have more current during high water than in low water; we have higher current in high water and when it increases up to fourteen or fifteen feet we have more current. I was going to say about the current, between here and Peoria, if the water raises high to between twelve and fifteen feet, we get a terrible current; there is considerable difference in the current between the wide and the narrow places.

Q. When you say the water is purer now than it was before the opening of the drainage canal, you judge by the appearance of the water?

A. Well, yes sir, that is the only way I have of testing the water.

Q. Not having tested it, of course you don't know what it contains?

A. No I don't.

Q. There is considerable smell since the opening of the
5593 canal?

A. No sir, not so much as there was before.

Q. Still there is considerable smell, is there not?

A. Yes sir. J. C. LOSCH.

5594 Whereupon an adjournment was taken until 8:00 A. M., Thursday, July 23rd, 1903, at Peoria, Illinois.

8:00 A. M., Thursday, July 23rd, 1903. Peoria, Illinois. Continuation pursuant to adjournment. Present, the Commissioner and same counsel representing the respective parties.

No witnesses being present, an adjournment was taken until 2:00 P. M., at Chillicothe, Illinois.

2.00 P. M., Thursday, July 23, 1903. Chillicothe, Illinois. Continuation pursuant to adjournment. Present, the Commissioner and same counsel representing the respective parties.

5595 Chillicothe, Illinois, July 23, 1903.

JERRY FOLSOM,

called as a witness in behalf of the defendants, being first duly sworn by the Commissioner, was examined in chief by Judge Johns, and testified as follows:

Q. What is your name, residence and occupation?

A. Jerry Folsom, Chillicothe, State of Illinois, and I am a fisherman.

Q. How long have you been a fisherman?

A. Well sir, I fished, not steady, but off and on ever since I was eight years old; big enough to row a skiff, and I am now 56; I have fished off and on for about 47 or 48 years with the exception of about two years I was in the naval service for Uncle Sam.

Q. Over what part of the Illinois river have you fished?

A. I have fished from here clear up to Spring Valley; that has been my fishing grounds, from here to there.

Q. What was the condition of the Illinois river at this point and above before January, 1900, when the drainage canal was opened?

A. Well, I would consider it poor.

Q. In what respect?

A. In winter season when we would cut holes in the ice, it would smell so bad you couldn't hardly stay around the
5596 hole, and the fish would die in the nets, in two or three hours time after they were caught or confined, or after

it was froze up hard, and they tasted of gas and tar until they wasn't fit to market.

Q. Did you cook fish yourself which smelled and tasted that way?

A. Yes sir; you could smell it when you was dressing them; you didn't have to cook them to smell it.

Q. What was the smell; what did it smell like?

A. Like gas or tar; kind of a coal tar or gas smell.

Q. What was the state of the water in the summer time?

A. When the weather got very hot there was a good deal of stuff growed in it; I never had no name for it; but it growed and would get green and had a growth on it, and it smelled bad.

Q. Now since the drainage canal waters have come down here what has been the condition of the river?

A. Well I haven't seen any of that growth, a little green strip comes once in a while but the growth hasn't come here since, and stuff that growed out of it, and I have had no dead fish since that time, nor no gassy fish.

Q. Has there been any smell in the water since the opening of the drainage canal?

MR. JEFFRIES: Objected to as leading.

A. Well nothing like it was; nothing like the gas that I
5597 have seen.

Q. How about the condition of the fish since the opening of the drainage canal?

A. The fishing is good and the fish appear to be healthy; I haven't seen any dead along the shores like there used to be.

Q. Before the opening of the drainage canal, did anything settle in your nets?

MR. JEFFRIES: Objected to as leading.

A. Yes sir.

Q. What kind of looking stuff was it?

A. Well, it was filth of some kind, I couldn't tell what it was, but it was filth anyway and nasty.

Q. Was there a great deal of it?

A. Yes sir, we would find a great deal of it.

Q. Have you had any of that since?

A. No sir, not like that.

Q. Was there ever a time here when the growth in the river obstructed or prevented navigation of the river?

A. From here to the bridge I saw a little tug boat, loaded with stone; that would be seventeen or eighteen years ago—that built the piers of this bridge up here; the little tug boat had to stop sometimes to come over to pass up, and when we went seining we would have to carry shovels along to get the
5598 stuff out of our nets, before we could get out the fish.

Q. How far is it from here to Peoria by river, downstream?

A. It is called eighteen miles, I think.

Q. How far is it from here to the bridge to which you refer?

A. A mile and a quarter from here, is what they called it. Up the stream.

Q. Before the opening of the drainage canal, you may state whether there was in the nets a slimy, whitish looking substance which filled up the meshes of the nets and hung in festoons or strings from the nets?

MR. JEFFRIES: Objected to as leading.

A. No, sir, I never saw any of that here either before nor since, that they filled up the meshes of the nets. The stuff gathers on them, but no such stuff as that, and it don't gather on them that thick. They get what I would call dirty and have to be rinsed off, like they would be if set too long; they gather stuff.

Q. Do you know the kind of slime here which is called slur-gut?

MR. JEFFRIES: Objected to as leading.

A. No, sir.

Q. Have you heard the fishermen from below Peoria talk of the slime called slur-gut?

MR. JEFFRIES: Objected to as leading and hearsay.

5599 A. No, I have never heard of such a name as that up here.

CROSS-EXAMINATION, by Mr. Jeffries.

Q. You say you live here in Chillicothe?

A. Yes, sir.

Q. How long have you lived in Chillicothe?

A. I have lived here since 1868.

Q. How do they get their water supply for domestic and drinking supply here?

A. They have wells.

Q. What kind of wells?

A. Drove wells, and from what they call the waterworks.

Q. How deep are these wells driven in the ground?

A. Well, sir, I don't know about that.

Q. About how deep?

A. Well, sir, I should judge from thirty to forty feet deep; somewheres from thirty to forty feet deep.

Q. The people here in Chillicothe don't use the water from the Illinois river for domestic or drinking purposes, do they?

A. No, sir.

Q. The current in the river is stronger now than it was before the Chicago drainage canal was opened, is it not?

5600 A. Yes, sir; there is more current than there used to be and the river stays higher.

Q. The fish in the Illinois river before the canal was opened were not condemned by the State Board of Health, were they?

A. I never had any examination of the fish, except when they died in the nets and smelled gassy, I quit fishing.

Q. You noticed the green scum on the water occasionally since the opening of the canal, haven't you?

A. Yes, sir, I have noticed the scum, there is once in a while the green scum, but no growth over it.

Q. A kind of an oily or greasy appearance of the water?

A. Yes, sir, it looks green, and at times it looks kind of greasy, but it has always done that since I have known it, at times.

Q. What is this growth that comes from the scum on the Illinois river?

A. It grows mostly in sluggish places; a slough puts up in the river and up in there it will grow until the river raises from the headlands and causes this stuff to run out.

Q. How does it grow? Heavy bodies?

A. In the first place you will notice this green color on the water, then it begins to grow in a seed, and the seed is green and

round; finally it gets roots on it; well half as long as my
5601 finger; then it gets a leaf on it; it looks something like a
clover leaf; I have seen them so thick along the bank that it ferments and smells horrible.

Q. The dirt and filth gets on the nets to some extent yet, does it not?

A. Oh, there is some; but it is not the kind of stuff that used to gather on them.

Q. Before the opening of the canal did this moss and green scum gather on the nets to a large extent?

A. No, that green stuff never gathered and growed on them, it floats; we had a kind of a moss that growed on them, but it was not this stuff.

Q. What is the character of the scum or of the growth or deposit on the nets since the opening of the canal?

A. This scum?

Q. What is the character of the deposit on the nets?

A. Well, it is a nasty, muddy kind of a stuff; we have to rinse our nets off once in a while; when this stuff gets on them we have to wash them off.

Q. It is a kind of a slimy, black mud?

A. Kind of a black, not slimy, that is to speak of. Of course it is dirty or we wouldn't have to wash the nets off.

Q. What is the difference between the deposit that gathered on the nets before the canal was opened and since the canal was opened?

A. It was a good deal more nastier then than it is now,
5602 more slimy and smelled worse.

JERRY FOLSOM.

5603 Chillicothe, Illinois, July 23, 1903.

BRADLEY B. HAWLEY, called as a witness in behalf of the defendants, being first duly sworn by the Commissioner, was examined in chief by Mr. Todd and testified as follows:

Q. What is your name?

A. Bradley B. Hawley.

Q. What is your business?

A. Steamboating and boating.

Q. Are you the captain and owner of a steamboat?

A. I am captain of a boat, but I can't say that I am really the sole owner of the boat.

Q. What boat are you the captain of?

A. City of Henry.

Q. How long have you been steamboating on the Illinois river?

A. Steamboating without other boating you mean?

Q. Steamboating and working on the Illinois river?

A. About 43 years.

Q. Are you up and down the river a great deal?

A. Yes, sir; I haven't been off the Illinois river in the summer for 43 years, one whole summer.

5604 Q. Were you acquainted with the Illinois river before the opening of the drainage canal?

A. Yes, sir.

Q. What was the condition of the Illinois river prior to 1900 as to the quality of the water?

A. Well, the quality of the water was always better above Peoria than it was below Peoria, that is a good many miles down; but in low water it was a pretty sluggish current and the water was pretty bad, very bad water.

Q. How was the water before the opening of the canal between Peoria and LaSalle?

A. Well, the water was what we—of course in the spring we didn't notice so much difference, but in the hot weather or low water, and dry times, the water was what we called pretty bad; that is, it moved very slowly in the river.

Q. Was there any odor emanating from the water?

A. Yes, sir; we used to smell it at times, especially in the morning, when we would get up.

Q. Did it have anything on top of the water?

A. Well, there was a good deal of this green stuff, whatever it may be, I don't know just what you would call it,—floating on top of the water.

Q. How was the water below Peoria before the opening of the drainage canal?

5605 A. Well, it was pretty bad.

Q. Do you know what made it bad?

A. Well, what we used to believe, what they used to say, was that it was the sewage from Peoria.

Q. How did the water above Peoria compare with the water below Peoria?

A. The water above Peoria was a good deal better than it was below Peoria at the same time; at that same year.

Q. Do you know where the sewage and polluting matter comes from that comes from Peoria?

A. Well, to give it a real foundation as to where it comes from, all that we noticed of where it comes from is out of those spouts; what we think it comes from. Of course we think it is out of the cattle pens, but then we never went up to see about that; how that was.

Q. Where do these spouts lead to?

A. You mean coming into the river?

Q. Yes.

A. Well, the most we noticed is between the T. P. & O. bridge—even below that, even below the T. P. & O. bridge.

Q. What are located immediately back of these spouts?

A. Why, sugar houses and still houses.

Q. Do you know the number of distilleries in Peoria?

5606 A. No, sir, I do not; I don't know the number of them.

Q. Do you know of any other source of pollution that enters the river at Peoria except that which comes through these spouts from these distilleries?

A. Well, I don't say as I do now; there used to be, the gas works put out a lot of bad water there; but within the last year or so I haven't noticed that.

Q. Do you know where the manure heaps are in Peoria?

A. Why, the manure in the river you mean?

Q. Yes?

A. What we saw was in front of those spouts that runs out that are supposed to be from still houses.

Q. About how many of those spouts are there leading from the still houses?

A. Well, there is some of them there that are not used at the present time. I won't be certain whether it is three or four of them that are not in use now.

Q. Did you ever have anything to do with the removal of these manure heaps?

A. Yes, sir, last summer they hired us to go in there after a feller and kick it out into the river and get the stuff away from the end of the spout.

Q. When was that?

A. I can't say exactly what month it was; it was in the summer after the water went down.

5607 Q. How long ago?

A. This last summer, last season; it was along after the water got low; I remember it was very hot. I remember it was June or July; I just don't remember exactly the month it was; it was hot weather, I remember that.

Q. About how much of that stuff had accumulated at the mouth of those spouts that you removed?

A. Well, we moved stuff that gathered in there, I should judge fully the length of this boat—well it would be nearly as big as this boat would be long, in that neighborhood; that was laying in front of the spouts.

Q. Can you give it in feet?

A. It would be pretty hard to give the exact number of feet; it would be a sort of a long, round mass of stuff together there. It wouldn't be square; it would be round; and most of it would be below the spout.

Q. Would it be as much as a half an acre?

A. Altogether?

Q. Yes?

A. Yes, sir.

Q. What was done with this stuff that you removed?

A. Why, he hired us to kick it out into the river with the wheels of the boat.

Q. Have you been below Peoria lately?

5608 A. Yes, sir—not very lately, but I was down there in April and May.

Q. Have you been below the bridge in Peoria lately?

A. Yes, sir.

Q. How lately?

A. Well, the water after you get down there—say after you get down a mile below the bridge, it begins to get kind of thick and full of something.

Q. What is its color?

A. Well, it is like dirty water; kind of a thick, dirty water.

Q. Any smell to it?

A. Well, I didn't get much of any smell this summer.

Q. Since the opening of the canal, what has been its effect upon the waters of the Illinois river both below Peoria and above Peoria?

A. Why, there is more of a current going than what there was, and the water is what I should call more pure than what it was before; that is, it looks more clear and more pure to me.

Q. How is it below Peoria?

A. Well, it is some stain of this—the same as it was before only it ain't so bad; it don't look so bad to me.

Q. Have you seen the water in Lake Peoria immediately
5609 above Peoria, since the opening of the drainage canal?

A. Yes, sir.

Q. What is the condition of that water?

A. Why, the water looks, as I said, more pure to me, than it was when this green scum settled on it—than it used to be years ago.

Q. How is it as to clearness today?

A. It seems to be—well, the water above Peoria never was very muddy; that is, after it got below this scum that used to float on it in low water. The Peoria lake water never was what you might call bad water, bad looking water, except when this scum was floating over the top; not to my recolection.

Q. Is the water in Lake Peoria as far as Chillicothe, better or worse than it was before the opening of the drainage canal?

A. Well, in my opinion the water is better and clearer than it was before the opening of the Chicago canal.

Q. How far from Peoria can you notice the effects, with the eye, of the sewage from the distilleries and sugar houses that empty into the Illinois river?

A. Below Peoria?

Q. Below Peoria?

A. Well, of course we never took a close observation of that, but you can notice it several miles. thicker water
5610 and a different color.

Q. Did you ever notice any gas bubbles coming up out of the water in front of those distilleries?

A. Oh yes sir, oftentimes, a substance that looked like this stuff that passes out of the cattle pens; it raises up in a great large piece that comes up with those bubbles,—it seems to come from the bottom of the river as far as you can see.

Q. Did you ever cut a hole in the ice before the opening of the drainage canal?

A. Yes, sir.

Q. What was the effect?

A. Well, it smelled bad.

Q. Where did the smell come from?

A. It seemed to come out of the hole, from the river; we undertook to drink the water and we couldn't do it.

Q. When did you do that?

A. I can't tell exactly what year, but in the neighborhood of seven or eight years ago.

Q. Have you done that since the opening of the canal?

Q. No sir, I never laid down there; it don't freeze where we have been laying, as it did that winter; we have been laying around Pekin and Peoria lately.

5611 Q. What business is the steamboat City of Henry engaged in?

A. Boating grain principally from the river towns into Pekin.

Q. Do you know about what the quantity of sewage which empties into the Illinois river from the distilleries and cattle sheds and sugar refineries at Peoria is?

A. No, I don't know the exact amount, because sometimes they are running a good deal more than they are other times; sometimes they trough about eight or ten inches deep and then they shut them off; they ain't running so much; they ain't running regular all the time, them that I have seen.

CROSS-EXAMINATION, By Mr. Jeffries.

Q. Where do you live?

A. I live aboard the boat, but we are more at Peoria than at other points.

Q. You say the current in the Illinois river from Henry to Pekin is very much more swift than it was before the canal was opened?

A. It is, yes sir.

Q. There is a good current all the way down, is there not, from Henry to Pekin, compared to what there was before the canal was opened?

5612 A. Yes sir, there never was much current in the lake; it runs very slow and always did; that is, excepting in high water.

Q. Lake Peoria is not really a lake, it is simply the widening out of the Illinois river is it not?

A. I am calling it just what they call it to me; they call it Peoria Lake.

Q. Well, I am getting down to the actual facts?

A. Well, I am explaining it just as I understand it, just as it was called, and told to me; the way that people generally called it; by name, Peoria Lake.

Q. It is a fact, isn't it, the water of the Illinois river flows into what is known as the head of the lake and out at the foot?

A. That is the way I understand it.

Q. Well you know that to be a fact, don't you?

A. There is no other way for it to get out.

Q. And no other way for water to get in?

A. No sir, excepting from what runs in from the creeks and supplies along the shore, whatever they may be.

Q. How long is that stretch of the Illinois river known by the people as Lake Peoria?

A. Just Peoria lake?

Q. Yes.

A. I never heard any other name for it since I have been

5613 on the river.

Q. No, but how long is it?

A. Well I can't tell you the exact length, only as I understand it from other folks. They call it eighteen miles to Chillicothe, and the lake probably ends down here something like a mile; what I should call the end of it, where it begins to shallow up; what I should suppose would be the end of the lake; what I would call the end of the lake.

Q. Now the lake begins you say, about a mile below Chillicothe?

A. Well, it is what I would call about a mile, that is, I never saw just exactly the end of it showed to me, only as I made my own idea that that would be about the only way, because it begins to look like the river again; it begins to narrow up and get like a river again.

Q. And it ends at Peoria?

A. Yes, sir.

Q. And you say it is eighteen miles by river from Peoria to Chillicothe?

A. That is what the people generally call it by the river or lake, to Peoria, eighteen miles.

Q. Then the lake would be 17 miles long?

A. According to the way they call it at Chillicothe and according to my way of telling about it; I have no other
5614 way of calling it; I have never saw it surveyed or measured in my life.

Q. You have passed down the river through what is known as Lake Peoria several times, have you not?

A. Yes, sir.

Q. Now how wide is the lake?

A. Well, it depends a good deal on the stage of the water, how wide it is; the banks are very low, and in high water it is a good deal wider than it is in low water. The water goes over the banks. I haven't any real way of knowing myself how wide it is.

Q. What was the average width of Lake Peoria at low water stages, before the canal was opened?

A. Well, as I said before—

Q. Give us your opinion, your judgment?

A. Well it wasn't quite as wide as it is since we got the canal in it.

Q. Well, how wide was it?

A. Well, I don't know, it might be a quarter to a half a mile—

Q. I want your opinion?

A. Some places it is wider than it is in other places.

Q. How wide would it be in some places?

A. There is one place down there at Spring Bay that it isn't any wider than the river would be for a little ways.

5615 Q. How wide would that be?

A. Probably in the neighborhood of a thousand feet wide, in what they call Spring Bay narrows.

Q. Spring Bay Narrows is about half way between the two ends of the lake, is it not?

A. Well, no, it looks to be further from the Narrows down to the lower end than it would be from this end to the Narrows.

Q. How much further?

A. Oh, I should judge one or two miles; I have no exact way of telling myself, only as I guess at it.

Q. Now the Narrows at Spring Bay, is about a thousand feet wide at low water time?

A. I should judge it would be about that.

Q. Now is that after the canal was opened or before the canal was opened?

A. Well the lake and the Narrows and the whole business is a little wider now than it was then on account of the sloping bank; that some more water covers each shore than it used to.

Q. Would it be fifty feet wider?

A. No, I don't think it would be, not in low water, excepting it would be caused by rain; caused by the regular sewer, I don't think it would be 50 feet wider.

Q. What do you mean by the regular sewer?

A. Why if it wasn't raining enough to keep it up, but just the natural flow from above.

5616 Q. From above where?

A. From the Northeast, or from Chicago down here; call it the sewer or canal, whatever it is.

Q. Now just below this narrow place in the lake how wide is it from there on down to Peoria?

A. Well as I said before I have no way of telling; it looks to me as if it was three-quarters of a mile wide, that is after you get below the narrows.

Q. And that was before and since the opening of the canal?

A. Well the lake is a little wider now than it was before, because they have got more water; how many feet I couldn't tell you exactly.

Q. Fifty or a hundred feet?

A. No sir, not that much.

Q. How wide is the lake above the Narrows to its head?

A. Well, it varies above the Narrows; it is wider some, in different places.

Q. How wide is it at the widest places?

A. Well, it looks like to me three-quarters of a mile; I have no way of telling exactly, only to guess at it.

Q. How wide is it at the narrowest places above the Narrows?

A. It looks to me as if it would average about three-quarters of a mile wide, until you get pretty well up.

Q. Now that was before the opening of the canal?

5617 A. Well I suppose it would be a little bit wider now than it was then.

Q. What is the average depth of the lake outside of the main channel which runs through it?

A. Well, there is some places where it is a good deal shallower than it is others. There is about, in the lowest time since this canal went in, I should judge it to be about eight or nine feet in the channel, and of course outside of that I couldn't judge; it is pretty shallow.

Q. About how much?

A. Well, it don't run at times. There is low places in it.

Q. Well, what in your opinion would be the average depth outside of the channel?

A. Of course, it would depend on how close to the shore you were and all that.

Q. I mean the average depth all over the whole water?

A. You mean the channel and altogether?

Q. No, outside of the channel.

A. Why I wouldn't suppose there would be over four to five feet of water, without you get close to the shore, if you would get close to the shore there wouldn't be so much.

Q. Some places not six inches?

A. Well, you would have to get pretty close to the shore if it was not over six inches of water.

5618 Q. And varies according to the stages of the water in the river?

A. Yes, sir.

Q. Now the channel or flow of the river comes into this what is known as Peoria Lake at the upper end and runs continuously and well defined clear through the lake?

A. Yes, sir.

Q. To the lower end, just above Peoria?

A. Yes, sir.

Q. Is there any other lake through which the Illinois river runs from Henry to Pekin than Lake Peoria, or what is known as Lake Peoria?

A. No sir, I always heard it called the river and no other name.

Q. And through all that distance from Henry to Pekin, there is a well defined continuous current or channel?

A. Yes, sir.

Q. Before the canal was opened you noticed a green scum on the water and you have also noticed that to some extent since the opening of the canal?

A. I noticed some yesterday in coming down along the shore; between here and Lacon up above.

Q. Before the canal was opened, the water under the scum was just as clear as it is since the opening of the canal, as I understand it? 5619

A. The water was, in what they call the Peoria Lake as far as I know, outside of a raise in the river, generally pretty clear, excepting the scum that would be on the top of the water during—

Q. Low water time?

A. The hot months, yes.

Q. You don't know whether the sewage gets down here or not?

A. Why I know just the same as other folks do, that it does; that it comes here and affects the river, because there is more water than there used to be; the supposition is that it gets here.

RE-DIRECT-EXAMINATION, By Mr. Todd.

Q. Mr. Hawley, what is the effect of the water of the Illinois river in the boilers for generating steam now, as compared with what existed before the opening of the drainage canal?

A. It depends on some where we are working; it depends some on where the boat is working; if the boat is working below Pekin it was a great deal worse then than it is now. Our boiler used to foam from what was supposed to come out of the still houses and sugar houses before that; our boilers used to foam and foam considerable.

5620 Q. How about above Peoria?

A. Well the water in the lake outside of a raise in the river is always pretty clear, but the river water seemed to be more foul. The boilers seemed to act all right with that water above Peoria.

Q. How about now, since the opening of the canal; how does the water from Peoria to Henry act on the boilers?

A. The water in the boilers that you take for steam seems to work better with our boat than it used to all the way along as far as we have been; it don't give what we call foam, or raise the water as much as it used to.

Q. How about below Peoria since the opening of the canal?

A. Well, the water is better than it was; clearer and better than it was; in the boiler it is much better in regard to what we call foaming or raising the water in the boilers.

Q. Does it foam above Peoria?

A. No sir, not in our work.

Q. Have you worked any below Peoria in the last three years?

A. Oh, yes, we was about 160 miles below Peoria in April and May.

Q. Between Peoria and Pekin now, what is the effect of the water in the boilers?

A. We don't have any trouble with the water in the boilers now the water doesn't seem to foam; we haven't had any trouble this summer.

5621 RE-CROSS-EXAMINATION, By Mr. Jeffries.

Q. The water immediately below Henry, down to as far as this point, Chillicothe, would occasionally foam in the boilers before the canal was opened, wouldn't it?

A. Why, we never had any trade from there here; our trade was all below Peoria and Pekin, you know; because there is where we went to unload.

B. HAWLEY.

5622 Chillicothe, Illinois, July 23, 1903.

O. F. THOMAS,

called as a witness in behalf of the defendants, being first duly sworn by the Commissioner, was examined in chief by Mr. Todd and testified as follows:

Q. What is your name?

A. O. F. Thomas.

Q. What is your business?

A. Physician and surgeon.

Q. How long have you been a physician and surgeon?

A. 25 years last March.

Q. Where do you live?

A. Chillicothe, Illinois.

Q. Doctor, what has been the condition of typhoid fever in the town of Chillicothe during the last three years?

A. I don't know of a case having occurred in the town during that time—yes there was; there was two cases that I know of, two years ago.

Q. Where were those cases?

A. They were on Fourth Street; that is four blocks west of the river.

Q. Did you attend those cases?

A. Yes sir, with Dr. Kelly.

5623 Q. Was the cause of those cases attributed to the river?

A. No sir.

Q. What was done with the dejecta of those cases?

A. They were all treated with bi-chloride of mercury and run into water closets after that.

Q. Have you a sewage system in this city?

A. No sir.

Q. Privy vaults?

A. Yes sir.

Q. What is the condition of the health of this city generally?

A. Well, we consider this a very healthy town and community.

Q. What is the source of the water supply of this city?

A. The city water supply is wells that are sunk alongside of the river right up here at the power house. Near the bank.

Q. How near are the wells to the river?

A. Well I don't know just exactly; I should judge 100 or 200 feet; perhaps it is closer than that.

Q. Do you know the nature and character of the wells?

A. They are driven wells.

Q. Is the water in those wells from the Illinois river?

A. Well, we suppose not; we don't know; I don't I am sure.

5624 CROSS-EXAMINATION, By Mr. Jeffries.

Q. How deep are those wells, doctor?

A. I do not know.

Q. About how deep?

A. I couldn't tell you; I don't know.

Q. How long have you been here?

A. About 48 years; I have lived here all my life practically.

Q. Are they deeper than thirty feet?

A. I think so. I have known a long while ago.

Q. Well in your judgment?

A. Thirty or forty feet.

Q. Do you know the character of the earth in which they are driven?

A. I think it is gravel.

Q. And sand?

A. And sand, yes.

Q. If the water does come into those wells from the river, it is filtered through the sand and gravel is it not?

A. Why yes, if it comes through the sand and gravel it is filtered.

Q. How large is Chillicothe?

A. About 2,500, the two towns together.

5625 Q. What do you mean by the two towns?

A. Chillicothe proper and North Chillicothe.

Q. Are they separate municipalities?

A. Yes sir.

Q. How far apart are they?

A. Oh, they are continuous; one into the other.

Q. Do they have separate postoffices?

A. Yes sir.

Q. Don't they get their water from the same source?

A. Yes sir.

Q. But have separate systems?

A. No, same system; all supplied by this power house down here, from the same well.

Q. The water is pumped from the well into a reservoir?

A. No, into the mains; it is direct pressure.

Q. The people of Chillicothe, or of North Chillicothe, don't use the water from the river for domestic purposes, do they?

A. No sir.

Q. You don't consider the water from the Illinois river good and wholesome for domestic purposes, do you?

A. No sir.

5626 Q. Those two cases of typhoid fever that you spoke of, do you know with any reasonable degree of certainty, the cause?

A. Yes, I had an examination of the milk supply made, and it was attributed to the milk.

Q. You found no typhoid germs in the milk however?

A. Yes, there was.

Q. Did you make the examination yourself?

A. No sir, I had it made in Chicago.

Q. Do you know where the milkman got the water that he used in the dairy or was it from a dairy?

A. Yes it was from a dairy, four miles northwest of town.

Q. On the river?

A. No sir, four miles from the river.

Q. The two patients lived here in town, did they not?

A. Yes sir.

Q. Male or female?

A. One male and one female.

Q. Live in the same family?

A. Yes sir.

Q. Did they have the typhoid fever at the same time?

A. Yes sir.

Q. Do you know whether or not any of the dairyman's family had the typhoid fever?

A. No, they did not.

Q. Did anyone else using the milk have the fever that
5627 you knew of?

A. Not that I knew of.

Q. Did the dairyman supply milk to any other families?

A. A great many of them, yes sir.

Q. In Chillicothe?

A. Yes sir.

RE-DIRECT-EXAMINATION, By Mr. Todd.

Q. Doctor, you said I believe that you had the milk analyzed?

A. Yes sir.

Q. Are you correct in stating that the typhoid bacillus was found in the milk that was analyzed?

A. No sir, not the typhoid bacillus; I don't remember now just what the report was, but the letter that the chemist sent to us was that his opinion was that the milk was the cause of the trouble.

Q. Who was it that made the examination of the milk?

A. I sent it to Chicago hospital; I don't know who made the examination.

Q. Was this a report from a chemist or a bacteriologist?

A. I don't know.

5628 RE-CROSS-EXAMINATION, By Mr. Jeffries.

Q. Doctor, state where you got the milk which you sent to the Chicago Hospital for examination; its condition at the time that you got it and the manner in which it was forwarded and the condition in which it was forwarded to the hospital for examination?

A. I took two clear test-tubes and had the domestic take the milk from the vessel as it was brought to the kitchen and set it to one side, and I sealed them and sent them to Chicago.

Q. Did you pack them in ice or anything?

A. No, it was in the winter; I mailed them.

Q. Did you sterilize the test tubes?

A. I boiled them and the corks also.

O. F. THOMAS, M. D.

5629 Chillicothe, Ill., July 23, 1903.

WILLIAM COLWELL,

called as a witness in behalf of the defendants, being first duly sworn by the Commissioner, was examined in chief by Mr. Todd and tesified as follows:

Q. What is your name?

A. William Colwell.

Q. Where do you live Mr. Colwell?

A. I live in Chillicothe.

Q. How long have you lived in Chillicothe?

A. I came to Chillicothe in 1847.

Q. What is your business?

A. Well, I have been in the contracting business for the last fifteen years most of the time, bridge building, etc.

Q. Have you constructed any bridges across the Illinois river?

A. Yes sir.

Q. What bridges have you constructed across the Illinois river?

A. I helped in the first place to build the Santa Fe Bridge right here.

Q. At Chillicothe?

A. At Chillicothe; I worked on that and I did trestle 5630 work east of the river; I helped to build trestle work east of the river; then I went to Peoria the next season afterwards and built the Santa Fe Road; I helped to build the upper free bridge at Peoria. I put in the sub-structure, all the foundation and tile work, and the trestle work and so on, on the east side of the river.

Q. Have you been on the river superintending that work yourself?

A. Yes sir.

Q. Have you had anything to do with any steam engines

A. Yes sir, I was running the pile driver and hoisting and so forth, and worked at dredging.

Q. Are you operating a pile driver?

A. Yes sir.

Q. At present?

A. Not at present.

Q. When did you cease?

A. About two years ago.

Q. What part of the Illinois river are you and have you been familiar with during the last ten or fifteen years?

A. All the way from Peru to Beardstown. I helped build a bridge at Beardstown, after the Peoria bridge.

Q. What other stretch of the river are you acquainted with besides the stretch from Peoria to Beardstown? Are you acquainted with the river from Peoria up?

5631 A. From Peoria to Peru.

Q. Will you describe the condition of the Illinois river, from Peru to Beardstown prior to the opening of the drainage canal as you knew it?

A. Well when I first went over the river in the early days, back fifty years ago, the Illinois river was a very nice stream of water; good water; I have drank many a drink out of the Illinois river when I was a young man; but after the towns began to grow and the Michigan Canal was built, they pumped Chicago river into the Michigan Canal at Bridgeport I think and after that the river began to get foul, and it kept on, as the population of the towns, etc., increased in Chicago, it kept on getting more so, for a number of years, until when we built the Santa Fe bridge, the river was very nearly entirely scummed over with a green coating, which looked like some fine vegetation. Well it got—it was so thick sometimes that it was hard work to row a boat through, row a skiff through it. I recollect when we were building the bridge up here and towing stone barges up;.it made quite a hindrance to the towing of barges up some days. That's about all I know about that particular part of it.

Q. How was the odor on the Illinois river prior to the opening of the drainage canal?

5632 A. Well it used to be sometimes, when the wind blew from certain directions, you could smell the river pretty plain.

Q. How was the river at Peoria when you were there, building the bridge at Peoria?

A. Well at the upper bridge it was just about the same as it is here; the upper bridge was just at the foot of the Narrows, it was probably clearer there than where the river was spread out more. The bridge at Peoria is right at the lower end of the Narrows and there is more current and more channel there than most places on the river.

Q. How was the river below the bridge?

A. At Peoria?

Q. Below Peoria?

A. The river there runs right into the lake and spreads out wide and I never noticed anything in particular there different from other places, only when the river would spread out wide there would be a green scum over the water, more so than where it was narrow and more current.

Q. How was the river below Peoria?

A. Late years?

Q. Yes.

A. Well, late years the river between Peoria and Pekin was pretty foul sometimes from the sewage and filth; they claim that it was the filth of the distilleries that made it foul.

5633 Q. How was it at Beardstown?

A. The river was pretty clear at Beardstown. I never could discern any filth any more in the river at Beardstown than we could up here; I never could.

Q. Since the opening of the drainage canal, what has been the effect of the waters of Lake Michigan upon the Illinois river at points where you have observed it, since that time?

A. I think the water is purer than it was then and less odor to it; and I have never seen the river scummed over with the green vegetation since the drainage canal.

Q. At what points along the river do you refer?

A. From here up to the Three I Bridge this side of Peru, this side of Spring Valley. I helped build a bridge at Spring Valley and I also helped build a bridge—the last bridge I helped to build was the Three I bridge, this side of Marquette.

Q. What is the condition of the water at Chillicothe since the opening of the drainage canal?

A. I think it is better than it was before the opening of the drainage canal.

Q. Do you notice any odor from the water now?

A. I haven't noticed any since the drainage canal—to ex-

plain that I will tell you; the water used to be, I used to when I would clean out my boiler, clean it out and fill it up with
5634 fresh water. I would always notice the first day using it after filling it up with fresh water that the steam—every time I would go around the engine I could smell the odor from this water and the odor was quite offensive; I don't know hardly what you would call it; but since the lake water has been turned down here I have never noticed that odor from my engines like I did before.

Q. How long back has it been since the Illinois river was as pure here and clear as it is today?

A. Well, I couldn't hardly tell how many years but it is quite a good many years.

Q. Give your best judgment?

A. My best judgment, it has been twenty-five or thirty years.

Q. How old a man are you?

A. I was 71 years old the 18th day of last June.

Q. Where were you born?

A. I was born in Ross County, Ohio.

Q. How many railroad bridges have you been connected with the construction of across the Illinois river?

A. Two.

Q. How many other kinds of bridges?

A. Three.

5635 CROSS-EXAMINATION,

By Mr. Jeffries.

Q. You live here in this town of Chillicothe?

A. Yes sir.

Q. You have a water system here, haven't you?

A. Yes sir.

Q. Where are those drive wells from whence the city gets its water supply located with reference to the Illinois river?

A. Why right up here on the bank on the first street on the river street two blocks above here.

Q. How far are those wells located from the bank of the Illinois river?

A. 100 feet probably. I am guessing at that; it is in the neighborhood of a hundred feet.

Q. How deep are those wells?

A. I couldn't tell you exactly.

Q. About how deep?

A. About 40 feet below the surface of the river, I think.

Q. That would be about how many feet below the surface of the earth?

A. Oh, probably 55 or 60.

Q. How many wells are there of this character, that are used by the city in securing its water supply?

A. I think there are six,—six 6-inch pipes.

5636 Q. What is the character of the ground or earth through which these wells are driven?

A. Sand and gravel.

Q. And after they are driven, there is a pipe of some kind put down, is there not; or is the pipe driven into the earth in the first place?

A. I think so, yes sir.

Q. Then the wells are encased with an iron tube or pipe?

A. Yes sir.

Q. From the surface of the earth to the full depth?

A. Yes sir.

Q. Aside from these wells that are used by the city in securing its water supply, are there any other wells, either in Chillicothe or North Chillicothe?

A. Yes sir, there are some individual wells.

Q. What is the character of the wells that are used by the individuals, who do not obtain their water from the city supply?

A. Well, the wells are dug down in gravel; dug clear down through the level of the river to the gravel; when they strike the level of the river they strike water as a general thing.

Q. Then these wells that are used by the individuals, known as private wells are living wells, are they not?

A. Living wells?

5637 Q. Yes. In other words, the wells depend not upon the drains, or surface water, but derive the water from the earth beneath?

A. Yes sir.

Q. The same as a spring?

A. Well the water here seems to be on the level with the river out through the gravel and sand all over the prairie; we have a sand prairie here about four miles wide and 7 miles long and pretty much all over that prairie the bottom of the wells are on a level with the river. My father when I was a young man had a well on a farm, a mile from town here and we took a level from the river out there on top of the land, and when we struck water, we wasn't a foot from the level of the river.

Q. The people here in Chillicothe don't use the water from the Illinois river for domestic and drinking purposes?

A. No sir, none that I know of.

Q. Do you use it?

A. No sir.

Q. Do you know the source of the water supply of the farmers and people living in the rural communities along the Illinois river at this point and at points above and below?

A. Well the majority of farmers use well water.

Q. And the remainder use either spring or cistern water?

A. Yes sir.

5638 Q. You say that the Illinois river water has gradually grown worse for several years back?

A. Yes sir.

Q. And particularly so after the opening of the Illinois and Michigan Canal?

A. Yes sir.

Q. Since that time do you know that the sewage from about a million and a half people of Chicago has been coming down through the drainage canal, and if so, what effect would that have upon your opinion as to the water being better now than it was before the opening of the canal?

A. Well I couldn't tell what the amount of sewage from Chicago that comes down here; but the water now appears to be better than it was before the opening of the canal.

Q. You judge from its appearance and not from what it may contain?

A. Well I judge from using it in my engine boiler; the difference in the smell of it and so forth.

Q. That, however, is based upon practical purposes and not domestic and drinking purposes?

A. Well of course it isn't my experience for drinking purposes; I haven't had any; I haven't tried to drink it.

Q. It smells occasionally now, since the opening of the canal does it not?

5639 A. Well I haven't noticed any odor from the river for the last year or so.

Q. The current is much stronger now than it was before the canal was opened, then I suppose?

A. Yes, sir.

WM. COLWELL.

5640 Chillicothe, Illinois, July 23, 1903.

J. E. DALRYMPLE,

called as a witness in behalf of the defendants, being first duly sworn by the Commissioner, was examined in chief by Judge Johns and testified as follows:

Q. State your name, residence and occupation?

A. J. E. Dalrymple; Chillicothe; fisherman.

Q. How long have you fished upon the Illinois river?

A. Well I have been fishing more or less for about sixteen years.

Q. Over what portions of the river?

A. I fished some at different times from Hennepin to Copperas Creek Locks.

Q. When did you fish below Peoria?

A. Well it was twelve years ago.

Q. How many seasons have you fished below Peoria?

A. I was down there about four years.

Q. What was the condition of the Illinois river below Peoria at that time?

A. Why the river was low down there one time, the water was low.

Q. As to moss or slime in the river, what was its condition?

A. There was lots of slime in that country at that time.

5641 Q. What kind of looking material was it?

A. Why it was a white colored slime; I don't know what you would call it; we used to call it bull-shit down there.

Q. Was there a great deal of it that got into your nets?

A. Yes sir, at places it was very bad.

Q. Now in your fishing above Peoria did you find that same kind of slime?

A. Well we would find it but not so bad.

Q. From Hennepin down to Peoria Lake?

A. No, it wasn't so bad; there was some of it though, all along the river.

Q. Since the opening of the drainage canal above Peoria and at this point, do you find that material on the nets?

A. No, I haven't been bothered with it any the last two or three years.

Q. What was the condition of the Illinois river at this point before the opening of the drainage canal for a number of years?

A. Why we have had low water for several years.

Q. Was there any kind of plant or moss growing in the river?

A. We call it shamrock here; a green stuff that used to grow around on the river and choke up the sloughs.

Q. Describe the leaves and roots of that plant?

5642 A. Well it is a three-leafed plant that had roots growing down into the water; it floated just about whereever the wind blew it.

Q. Did it get into the river here in any great quantity?

A. Well I have seen it pretty bad; we had to fish on the east side of the river with an east wind and on the west side with a west wind.

Q. That is, you had to take where the wind had cleared the river of this stuff?

A. Yes sir.

Q. Before the opening of the drainage canal was there a smell here to the water?

A. In the winter time there world be a pretty bad smell at times.

Q. How was it at the time the river was frozen over?

A. Why it was bad; you could smell it above the town, from the river here; right above here we have a shallows or rapids, that always stays open during the winter.

Q. What effect did it have on the fish?

A. I have seen the fish die in good numbers here.

Q. Did it taint the fish?

MR. JEFFRIES: Objected to as leading.

A. Why there wouldn't nobody buy them from me around town; you couldn't eat them yourself.

5643 Q. What kind of an odor was it?

A. Why, I ate some of the fish and it tasted to me just like tar; I had tar on my tobacco and it tasted just like that. You couldn't tell much difference between the taste of it and the taste of the fish.

Q. Was there a smell in this shamrock that grew in the waters here in the summer?

A. Why yes, if you would pile it up it would heat; the wind would pile it up and it would heat.

Q. And then a smell would come from it?

A. Yes, it would heat. I have saw it six or eight inches deep on this steamboat landing, right here where you have landed, when the wind drove it in.

Q. Did it sometimes prevent boats from running here?

A. Why, these propellers and small tugs, it would choke up and you would have to take a ice hook and pull it out of the propeller wheel.

Q. Since the opening of the drainage canal, what has been the condition of the water above Peoria?

A. Why we have had good water and lots of it.

Q. Is the water purer than before.

MR. JEFFRIES: Objected to as leading.

5644 A. Yes sir.

Q. Is there any of the odor now that there was before the opening of the drainage canal?

A. I haven't noticed it in the last couple of years.

Q. How about the slime here since the opening of the drainage canal, and moss?

A. Why, it don't bother us any more.

Q. Before the opening of the drainage canal, above Peoria, did the fish live in the live-boxes?

A. Why we hardly ever put them in the live boxes in warm weather; they wouldn't keep over night.

Q. How is it since the opening of the drainage canal?

A. Our fish live very good now.

Q. Are you fairly well acquainted with the fishermen along the Illinois river from Copperas creek dam to Hennepin?

A. Why yes, I am acquainted with some of them all the way along.

Q. Do you know of any typhoid fever among them since the opening of the drainage canal?

A. No, I don't know of any such case.

Q. Take the fishermen as a class, in this vicinity, what is the general state of their health?

A. Why it is pretty good; malaria is the only thing that bothers.

5645 Q. Is there more or less malaria among them since the opening of the drainage canal?

A. Well I couldn't say as to that; it ain't bothered me any in the late years.

CROSS-EXAMINATION,

By Mr. Jeffries.

Q. How old are you?

A. I was 42 years old the first day of last February.

Q. How long have you been fishing?

A. I have been fishing off and on for the last sixteen years.

Q. What did you do before you fished?

A. I used to work on a farm some and I worked at lathing.

Q. Do you live in this town?

A. Yes sir.

Q. You don't live in a house-boat?

A. No sir, I live one block from the river.

Q. Where do you get your water supply for domestic purposes?

A. From the City.

Q. You don't drink water from the river then?

A. Why we don't use it at the house, no.

Q. And you don't drink it only when you are out on a fishing trip and can't get anything else?

5646 A. We don't carry no water in winter season or fall or anything like that; we carry water now. We drink the water at other times.

Q. What do you mean when you say the water is better now than it was before the canal was opened?

A. Why I mean the water is better every way; it is clearer, purer, better to drink; no slime in the nets to bother the fishermen.

Q. What is the character of the slime that forms on the nets in the river here at Chillicothe?

A. Why, there doesn't any form on, particularly lately; we used to have a stuff that formed on the nets here; we ain't been bothered with it lately.

Q. You say you have seen the green scum and vegetable growth on the banks of the river here at the wharf?

A. Yes sir.

Q. There was no current in the river then?

A. Well, not much.

Q. Since the opening of the canal there has been continuously a good current all the time?

A. Yes, there is too much.

Q. What do you mean by too much?

5647 A. Too much for my business.

Q. For the fishing business?

A. For the fishing business.

Q. A greasy oily substance forms on the water now, doesn't it?

A. Why I haven't noticed any.

Q. At no place, at no time since the opening of the canal?

A. I couldn't say as to that; I haven't noticed any in two or three years.

Q. The State Board of Health of Illinois never condemned the fish in the Illinois river, did it?

A. Why, not to my knowledge.

Q. Where are you fishing now?

A. Right here at Chillicothe.

J. E. DALRYMPLE.

5648 Chillicothe, Illinois, July 23, 1903.

SAMUEL HOSSELTON,

called as a witness in behalf of the defendants, being first duly sworn by the Commissioner, was examined in chief by Judge Johns and testified as follows:

Q. What is your name, residence and occupation?

A. Samuel Hosselton; my main residence is Chillicothe, Illinois; and my occupation was a farmer until I quit. All I do now about is fish when I feel like it.

Q. Are you a net fisherman or do you fish with a pole and line?

A. I fish with a pole and line.

Q. How long have you lived on the Illinois river in this vicinity?

A. Since 1864.

Q. Have you fished in it a good deal during that time with rod and line?

A. Yes sir.

Q. What was its condition in this vicinity before the opening of the drainage canal?

A. Well in low water it was in very bad condition I
thought; there was very little current and the water was
5649 very foul; that is, there was a vegetation growed on the
river and being no current, it would be impossible almost
to get through it at places.

Q. Was there any odor in the water prior to the opening of the drainage canal?

A. Why, nothing more than there is commonly in low water. Of course take stagnant water, there is always more or less odor.

Q. Did you know about its condition in the winter under the ice?

A. Yes sir, in 1893 and 1894, I run this ferry boat, and in the winter of 1893 and 1894, it was very thick ice, and before we got it open—after the ice became unsafe, we had to cut the channel open before the ice went out, and it was a terrible odor that came from under that ice; it killed nearly all the fish that was in this vicinity, that was under the ice.

Q. Since the opening of the drainage canal what has been the condition of the water in the Illinois river?

A. Well in my opinion the water has been purer than it was before.

Q. How about the vegetation in the water?

A. I see nothing more of that only in pools, back water.

Q. Is there any odor in the water now, since the opening
5650 of the drainage canal?

A. Not that I could discover.

CROSS-EXAMINATION,
By Mr. Jeffries.

Q. How long have you lived here in Chillicothe?

A. I have lived here since 1883.

Q. Have you a private well or do you use the public water?

A. I use the public water, but that water is from a well.

Q. You don't use the water from the river?

A. Well I should judge not; they all tell me that the water flows from the west into the river and it shows it along the river where there are springs.

Q. What I mean by that is, you don't go to the river and dip the water up?

A. Oh no; we get our water from the waterworks.

Q. You say you farmed before you moved to Chillicothe?

A. Yes sir.

Q. How far was your farm located from the Illinois river?

A. It is about two miles and a half above, what we call on the Sparland Road; it is a little bit east of north of Chillicothe.

Q. Do you know the character of the water and the source from which it is obtained that is used by the farmers in
5651 the vicinity of Chillicothe?

A. Well I know that most of the farmers get their water from wells.

Q. The same character of water and by practically the same means as the people living in Chillicothe?

A. Yes sir.

Q. Do you know whether they use the water directly from the river or not?

A. The farmers?

Q. Yes.

A. I know they do not.

Q. When you say that the water in the Illinois river is better now than it was before the Chicago Drainage Canal was opened, you have no other means of determining except from observation?

A. That is all.

Q. As to whether it contains deleterious matter, or material from the sewage of Chicago, you have no information?

A. None whatever.

Q. Were you on the river frequently prior to the opening of the canal?

A. Very often.

Q. What was the character of the river with reference to the flow or current?

5652 A. It was with reference to the stage of water.

Q. Well with low stages?

A. There was a very little flow in the river.

Q. Did this green scum form on the waters of the Illinois river before the canal was opened, when the water in the river was at an ordinary stage?

A. As to that I can't state; I was in the state of Florida, for one summer and two winters, at the time they opened the canal.

Q. Well I am speaking before the opening of the canal?

A. Then I didn't understand the question.

Q. (Previous question read)?

A. Yes sir.

Q. Now what was—was there much current in the river at an ordinary stage when this green scum formed on the river?

A. Very little.

Q. With reference to the condition and flow of the river, prior to the opening of the Chicago drainage canal as compared to its condition, flow and current now, since the opening of the canal, at ordinary stages of the water?

A. Well, I consider the flow considerably more and the water I think is purer than it was then.

Q. Do you know of anyone in this vicinity who uses the water for domestic and drinking purposes in their homes?

5653 A. I do not.

Q. What is the reputation of the water of the Illinois river and what has been its reputation with reference to being a wholesome water?

JUDGE JOHNS: Objected to as not cross-examination.

A. I never heard that talked of very much, the wholesome part of it.

Q. Did you ever hear the people discuss the question as to whether it was good water to use for domestic purposes or not?

A. No, I never did; that was because no one used it.

Q. That was because no one used it?

A. Yes.

SAMUEL HOSSELTON.

5654 Chillicothe, Illinois, July 23, 1903.

JOHN DAVIDSON,

called as a witness in behalf of the defendants, being first duly sworn by the Commissioner, was examined in chief by Judge Johns, and testified as follows:

Q. What is your name, residence and occupation?

A. My name is John Davidson; my residence is Chillicothe, and my occupation is a fisherman.

Q. How long have you been a fisherman?

A. Well sir, I have been a fisherman for over forty years; I commenced to putter around a boat when I was 13 years old and I am now 55 years old.

Q. Over what portions of the Illinois river have you fished?

A. From Lacon to Spring Bay. Not much above Lacon and not much below Spring Bay.

Q. How far is Spring Bay from here?

A. About eight miles below here.

Q. What was the condition of the Illinois river in this vicinity before the opening of the drainage canal, in January, 1900?

A. It was in pretty bad shape.

Q. In what way?

A. Why in filth—I don't know what you might call it,—
5655 but filth and the water was not fit to drink, and the fish died in it and the clams, and one summer here the clams all died; the river was floating full of them, thousands and thousands. You could go out here and take up a skiff-load of them and they died; some turtles died. About the next year after the Henry dam was put in; that is when it commenced to get bad.

Q. Was there any plant growing?

A. Well, not much; whenever the water was low, and just natural weeds and there was grass,—river grass and pond lilies here and there along the soft, musty places in the river, always.

Q. Was there any kind of a scum formed on the river?

MR. JEFFRIES: Objected to, as leading.

A. Oh yes; we had to skim it off; sometimes we would have to go three or four miles until we could find a place to sein; where it was blowed off. You had to take the seine out, out above all of it and you couldn't find the fish in it; it would take six or eight men to hoist it out; it formed a kind of a weed on top of the water with a root to it.

Q. What about a smell in the water before?

A. Oh, fearful; above this bridge up here there is a drift in there and this stuff would float down East River; it would be that thick you couldn't row a skiff through it and it would stink terribly.

5656 Q. What was the condition of the fish?

A. Why in the winter, it would freeze hard and every fish would die; and they was gassy and you couldn't eat them at all; you could take them right out of the water and they was gassy, you couldn't eat them at all; just like you had fried them in tar.

Q. As to the condition of the water under the ice, what do you say?

A. Why, it got so that it would be impossible for you to stand near a hole, pretty near, for the smell; if you cut a hole in the ice. You have been on the Chicago River haven't you?

Q. Yes sir, I had a whiff of it.

A. Well, it was just as bad as the Chicago River smelled right under that ice, only it was kind of more gassy, and drink it;—I wouldn't warrant a fellow to live five minutes if he took a drink out of it.

Q. If you caught any fish would they live in the live-boxes?

A. No; now I will tell you a circumstance here so you will know; it froze up here at Crow Creek; it was a spring stream; you could drive a wagon right up to the edge of the spring water. Joe Carle and me seined in there; I seined next to the

mouth of the creek and he seined next below me, and if you would take a fish out of that spring water and put him
5657 back fifty yards from the edge of that ice, he wouldn't live as long as he would out on the land. They crowded in there you know, to get away from this filth, and you would pull the seine in and it would look like you could walk out on them and then we would take dip-nets and dip them out, three or four men, and take the seine in and haul it in again and get as many again; they was all crowded in that place, to get away from that river water. The ice was clear and you could see these big shovel fish floating down under the ice.

Q. Now since the opening of the drainage canal what has been the condition of the water here?

A. Well it has been pretty fair; the water has been up pretty well; the first year the drainage canal was opened, we could seine; and we never had fish die in the live-boxes; we could keep them three or four days and we never could do that before.

Q. How about the smell of the water since the opening of the canal?

A. Oh, it has been pretty fair since the opening of the drainage canal. The first time I have seen any of that scum on the water and then there wasn't a great deal, was last evening, there was no wind and you could see it floating down—not much.

Q. Is the water clearer and cooler than it was before?

MR. JEFFRIES: Objected to as leading.

5658 A. Oh yes, a great deal cooler; it would be so hot it would scald your feet very near; now it is cool and it hasn't been very hot since that drainage was put in.

When they had a pretty good flow of drainage, you know, after a rain in two days it would clear off, and that drainage would clear it up.

Q. Are you pretty well acquainted with the fishermen in this vicinity?

A. Pretty well, yes sir.

Q. Do you know of any typhoid fever among them since the opening of the drainage canal?

A. No—No sir.

CROSS-EXAMINATION, By Mr. Jeffries.

Q. You have lived here practically all your life?

A. Yes sir, I have lived not over six miles from here, all my life—my home.

Q. Before the canal was opened, the water in the river here, at ordinary stages, was comparatively quiet and still, very little current in it?

A. No current at all after that dam was put in here below.

Q. What dam?

5659 A. Copperas Creek dam, the one below there, just like a slough in it; dead water and it would freeze quicker than a pond, just about the same as a pond.

Q. How is the current now compared to what it was before the canal was turned in?

A. Very near just like as if no current at all then. There is an awful current in the river now. You can't hardly row in it here hardly now.

Q. You mean since the opening of the canal?

A. Yes sir.

Q. You spoke of one summer when the fish and clams and turtles died; that was the year after, or the summer after the completion of the Henry Dam?

A. No I think that was two or three summers after that dam was put in; I couldn't tell exactly.

Q. That didn't occur every summer?

A. No that didn't occur every summer.

Q. Nor very frequently?

A. Not very frequently.

Q. Only this one time?

A. Only this one time, and it was right in July, in the summer time.

Q. You say there is some green scum on the river now in the summer time?

5660 A. Yes sir, there is some; there was some yesterday evening, I noticed it.

Q. And there has been some every year since the canal was opened?

A. Oh yes sir, there has been some but not like it was before.

Q. Do you live here in the town of Chillicothe?

A. Yes sir, I live here in town, right up here this side of the power house, in a cabin-boat.

Q. In a cabin boat on the river?

A. It is blocked up now. I blocked it up last winter.

Q. You blocked it up last winter?

A. Yes sir.

Q. It was in the water before that time?

A. Yes sir.

Q. How long have you lived on a cabin-boat?

A. I have lived on a cabin-boat; it is about nine or ten years since I bought this boat.

JOHN DAVIDSON.

5661 Chillicothe, Illinois, July 23, 1903.

A. C. WILKEY,

called as a witness in behalf of the defendants, being first duly sworn, by the Commissioner, was examined in chief by Judge Johns and testified as follows:

Q. What is your name, residence and occupation?

A. A. C. Wilkey; my occupation is running a boat-yard and my residence is Chillicothe.

Q. Have you ever been a fisherman?

A. Yes sir.

Q. For how long a time did you fish upon the Illinois river?

A. About ten years.

Q. Over what portion of the Illinois river did you fish?

A. From Hennepin to Beardstown.

Q. When did you fish below Peoria?

A. The winter of 1897 and 1898.

Q. What was the condition of the Illinois river below Peoria in those two years that you fished?

A. I wasn't there two years; I was there from one fall to the next spring.

Q. Yes.

A. Why the condition of the water was very bad.

5662 Q. In what way?

A. Well it was covered—it covered our nets with slime, so that we had to take them up every five or six days and wash them out; it would get so heavy it would pull the poles over.

Q. What was the appearance of this slime?

A. Well, it was like snot, that's what it looked like.

Q. Did you fish any below Peoria after the opening of the drainage canal?

A. No sir.

Q. How many seasons did you fish at or near Chillicothe, and from Chillicothe to Hennepin before the opening of the drainage canal?

A. I fished two years at Hennepin and the balance of my fishing was done right here.

Q. What was the condition of the water in this vicinity before the opening of the drainage canal?

A. Well, when the water was very low it was pretty bad and in the winter when the river was froze up it was very bad; that is it wasn't as bad for sediment and stuff in the water as it was for smell.

Q. What made it bad in the summer; was there some growth or plant in the water?

A. Yes, there was what we call shamrock and this long grass that grew on the bottom.

5663 Q. Did this grass and shamrock obstruct the river here at times?

A. Yes sir.

Q. You may tell how; tell an instance of that?

A. The year the bridge was built; it got so thick that it clogged up in the river—well it got so thick that I got stuck with a tug in it; it would gather under the barges so that I couldn't tow them. I was towing stone for the bridge company.

Q. In what business were you engaged that winter that you used the barges?

A. Why I was running tugs for the bridge company; it wasn't in the winter; it was in the summer.

Q. I mean summer. When the river froze over, before the opening of the canal, what was the condition of the water?

A. Well it was gassy, it tasted and smelled gassy.

Q. What was the condition of the fish?

A. So gassy that you couldn't eat them.

Q. Did they die under the water—under the ice?

MR. JEFFRIES: Objected to as leading.

A. Yes sir.

Q. Were you here one summer when the clams died in the river?

MR. JEFFRIES: Objected to as leading and sugges-
5664 tive and assuming the fact.

A. Yes sir.

Q. What year was that?

A. Well I couldn't say; it was some time ago though; it was either 1895 or 1896.

Q. Describe what occurred that year with reference to the animal life in the river?

A. Well the clams was all I noticed that died.

Q. Did they float upon the water; did they come up?

A. Yes, I have seen them come to the top.

Q. Since the opening of the drainage canal, what has been the condition of the river?

A. Well it has been better than it was before, as to smell.

Q. Is there any of that slime such as you noticed before at Peoria, here since the opening of the canal?

MR. JEFFRIES: Objected to as leading.

A. I never noticed any either time—not up here.

Q. Is there any of that shamrock plant in the water here now, since the opening of the canal?

MR. JEFFRIES: Objected to as leading.

A. Yes sir.

Q. To what extent?

A. Well not as bad as it was before.

5665 Q. Does it grow here in the river or come into the river out of the sloughs?

A. It comes out of the sloughs.

Q. Do you know whether that is the same plant that is called water-clover about here, by some?

A. I do not.

Q. Are you fairly well acquainted with the fishermen in this stretch of river here?

A. I know every one of them.

Q. What is their condition as to having typhoid fever since the opening of the drainage canal?

A. I have never known one of them to be sick.

Q. As a class, what is their condition of health generally?

A. Good.

CROSS-EXAMINATION, By Mr. Jeffries.

Q. How long have you lived in Chillicothe?

A. Forty years.

Q. All your life?

A. No sir, I have got fifteen years to go on besides that.

Q. Do you live in a dwelling in town or on the river?

A. I live just a block from the river.

Q. Have you a well or a cistern at your house?

5666 A. I have a well and a cistern both.

Q. And you use the water from the hydrant for washing and drinking purposes both?

A. I use the hydrant water entirely for drinking and the other for washing.

Q. Do you remember the summer that you stated the fish and clams died?

A. Yes sir.

Q. It was the year after the construction of the Henry Dam, was it not?

A. Oh no; it was long since that; it was somewhere between 1894 and 1896; I was running a seine that summer and I don't think of anything that I could place it exactly; somewhere about that time.

Q. Did it ever occur at any other time than that one time to any extent?

A. That is all, except in the winter time, when the fish died.

Q. How many times in the winter time did the fish die?

A. They died every time when the river froze over solid.

Q. And when it was low?

A. Yes sir.

Q. What was the condition of the river prior to the opening of the Chicago canal, as compared with its condition since the opening of the canal, so far as flow and current is concerned?

5667 A. You mean the quantity of water?

Q. The current or flow?

A. The current is considerably more.

Q. Before the canal was opened, there was very little current here, and in this vicinity, at ordinary stages of the water, was there not?

A. Yes sir.

Q. And since the opening of the canal there has been a splendid current?

A. There has been more current.

Q. Very much more, hasn't it?

A. Yes sir.

Q. Do you see any of the green scum on the river now?

A. Yes sir.

Q. Do you smell some odor too?

A. Well, not very much.

A. C. WILKEY.

6:00 P. M. Whereupon an adjournment was taken until 7:30 P. M., same day.

5668 Chillicothe, Ill., July 23, 1903.

Met pursuant to adjournment at 7 P. M. Present, the Commissioner and same counsel.

MARTIN TRUITT,

called as a witness in behalf of the defendants, being first duly sworn by the Commissioner, was examined in chief by Judge Johns and testified as follows:

Q. State your name, residence and occupation?

A. Martin Truitt, Chillicothe, Peoria County, Illinois; my occupation is fisherman.

Q. How long have you been a fisherman on the Illinois river?

A. All my life, you might say, for the last 25 years.

Q. Over how much of the river have you fished?

A. I have fished between Chillicothe and Peoria and Chillicothe and Lacon.

Q. Have you been a boatman upon the Illinois river?

A. No, I was never a boatman.

Q. What was the condition of the Illinois river at this point before January, 1900, when the drainage canal was opened?

A. Why I think it was pretty bad; the water was bad, and there used to be green stuff here that you could hardly row a skiff through it, a good many times, and in the winter time if you chopped a hole in the ice, you would have to get away from it on account of the rotten gas coming out; the fish would die; since the canal has been opened, it hasn't been that way 5669 since; I never saw it purer in my life; the fish live better in live-boxes too, now since that.

Q. Have the fishermen on the Illinois river since the opening of the drainage canal, the typhoid fever?

MR. JEFFRIES: Objected to as leading.

A. I don't know; some of them wants the canal opened.

Q. No, you don't understand me. Have the fishermen since the opening of the canal had typhoid fever?

A. No, no.

CROSS-EXAMINATION, By Mr. Jeffries.

Q. You say some of them want the canal opened and some don't?

A. Yes, just a few of them.

Q. Have you always lived here?

A. Yes sir.

Q. Been fishing all your life you say?

A. Yes sir.

Q. Was your father a fisherman?

A. He was a fisherman part of the time; he worked on a fish-boat.

Q. Do you live in a fish-boat?

A. No, I live in a cabin.

Q. Is the cabin a boat?

5670 A. Yes sir.

Q. Is it on the river?

A. No sir, it is up on the bank now.

Q. How far from the bank?

A. Oh, about sixty feet I guess.

Q. It has been in the water?

A. Yes.

Q. How is the current in the river now compared to what it was before the canal was opened?

A. Why there is more current in the river now since the canal was opened.

Q. Was there much current before the canal was opened?

A. No.

Q. How much?

A. I know it wasn't enough to float the green stuff off the river; that green stuff.

Q. That green stuff was mostly decayed vegetable matter wasn't it?

A. No, some of it was stagnant water; that's what I believe about it.

5671 Q. You have noticed the greasy, oily substance on the water since the opening of the canal, haven't you?

A. Why not so much as there was before.

Q. Not as much?

A. Well, there ain't so awful much now.

Q. But you have noticed it?

A. Yes, but not so much.

MARTIN TRUITT.

5672 Chillicothe, Ill., July 23, 1903.

CHARLES F. SCHMIDT,

called as a witness in behalf of the defendants, being first duly sworn by the Commissioner, was examined in chief by Judge Johns and testified as follows:

Q. State your name, residence and occupation?

A. Charles F. Schmidt, Chillicothe, and my occupation is fishing, and has been for the last twelve years.

Q. Over what portion of the Illinois river have you fished?

A. Well I have fished from Copperas Creek Lock as far as Hennepin; I haven't fished much above the Henry Lock.

Q. Did you fish below Peoria before the opening of the drainage canal?

A. Yes sir.

Q. How far below?

A. Well I fished down as far as Copperas Creek Lock.

Q. What was the condition of the water in the Illinois river below Peoria before the opening of the drainage canal?

A. Well sir, it was awful bad.

5673 Q. Just tell about it?

A. The slime would gather on the nets so that you couldn't hardly raise one onto the boat. This was below Peoria, right at what they call Coon Hollow Island; that is about three, or four miles and a half above the lock.

Q. What kind of slime was that?

A. Well it was white; puts me in mind of snot a good deal; looks like it. I have had to drag the nets on the bank right out of the water.

Q. Did you fish any below Peoria after the opening of the drainage canal?

A. Well I fished one part of a season. But I never fished no nets that season. I fished a seine that season.

Q. What was the condition of the Illinois river at that time?

A. It was better there then, at the time I was there.

Q. Where did you fish that season?

A. I fished at Kingston; Kingston mines.

Q. How far is that below Pekin?

A. It is fifteen—ten to fifteen miles below Pekin.

Q. Now did you fish in this vicinity, before the opening of the drainage canal?

A. Yes sir.

Q. What was the condition of the Illinois river here and in this neighborhood before the opening of the drainage canal?

5674 A. Well you couldn't keep fish alive very long, that is in the live-boxes, but it wasn't as bad here as it was below Peoria.

Q. Was there any green looking stuff grew in the water here?

MR. JEFFRIES: Objected to as leading.

A. Yes there was some, what we called moss.

Q. How much of that stuff was there which would gather up here in the current of the river?

A. Well there was times it would run thicker than others.

Q. Is it sometimes called shamrock?

MR. JEFFRIES: Objected to as leading.

A. Well I have heard them call it that.

Q. How about a smell in the water here before the opening of the drainage canal?

A. Well in the winter time it was bad; sometimes you couldn't hardly stand it through the ice; you could smell it easy.

Q. What effect did it have upon fish?

A. Why it killed the fish every winter, very near; that is the small fish anyway.

Q. Since the opening of the drainage canal what has been the condition in this vicinity?

A. Why the water has been better in this vicinity to my knowledge; the water never killed no fish that I know 5675 of; well before this drainage was turned in, the fish got so here we couldn't eat them, but since that I haven't heard anything of it.

Q. How about the green substance in the water?

A. Well I haven't seen no green substance to speak of since.

Q. Do the fishermen on the Illinois river so far as you know, since the opening of the drainage canal, have typhoid fever?

MR. JEFFRIES: Objected to as leading.

A. I haven't heard of any, nor seen any either.

CROSS-EXAMINATION, By Mr. Jeffries.

Q. There is some green scum on the water now is there not?

A. Well that green scum now grows in the back water unless the wind happens to blow it out; that is all I have seen this year.

Q. What was your business before you became a fisherman?

A. Well sir, before that I was a common laborer.

Q. Did you live here?

A. No I lived in Peoria.

Q. You were born and raised in Peoria?

A. No sir, I was born and raised in Indiana.

Q. Since the opening of the Chicago drainage canal, and the passage of the sewage from Chicago, mixed with the 5676 lake water there has been a very great increase in the flow or current of the water in the Illinois river at this point and all along the places where you have fished, has there not?

A. Yes sir; more current and more water.

Q. What was the condition of the river with reference to its current before the canal was opened?

A. What was the condition with reference to the current?

Q. Yes.

A. Well it wasn't strong only in high water.

Q. At times and when the river was at an ordinary stage, there was very little current?

A. Very little current in this part of the country; but take the river below Peoria, there was more current always. This on an average was deep water this way.

Q. What is the condition of the river with reference to its current since the opening of the canal?

A. Well it has been swifter.

Q. Very much so?

A. Good deal swifter, only in high water time.

Q. Then it is not so swift out here in high water times?

A. It is just as swift here in high water times; but in high water times as I know it, the water got swifter in high water times than it gets now in high water times.

5677 Q. You have been fishing for how many years?

A. Twelve years.

Q. You have fished every year since then?

A. Yes sir.

Q. Continuously?

A. Yes sir. When I done anything, that's what I done — fished.

CHAS. F. SCHMIDT.

5678 Chillicothe, Illinois, July 23, 1903.

E. N. NELSON,

called as a witness in behalf of the defendants, being first duly sworn by the Commissioner, was examined in chief by Judge Johns, and testified as follows:

Q. What is your name, residence and occupation?

A. E. N. Nelson; Chillicothe, Illinois; fisherman.

Q. How long have you been a fisherman upon the Illinois river?

A. Off and on for twenty years.

Q. Over what part of the river have you fished?

A. Only in the vicinity of Chillicothe, between Lacon and Peoria.

Q. What was the condition of the Illinois river in this vicinity before the opening of the drainage canal in 1900?

A. Well it got very foul in low stage of water in warm weather; it got very foul.

Q. What kind of substance was there in it?

A. Well it was a green vegetation of some kind growing out, during the month of July and August; the water would look green.

Q. In the summer did the water have an odor—a smell?

MR. JEFFRIES: Objected to as leading.

A. Yes sir, it smelled foul and bad; especially when it was stirred up by a boat or anything. 5679

Q. What was its condition in the winter?

A. In the winter when it froze up it would get a kind of a gassy, tarry smell; if you cut a hole in the ice you could hardly stand over it.

Q. What was the effect upon the fish?

A. Why the fish were unmarketable at that time of the year, when the river was frozen over in the winter time; you could hardly stay in the house where they were cooking them and you couldn't eat them at all.

Q. How would they live in the live-boxes?

A. Why they didn't live; they would die in the live-boxes in a very short time.

Q. Since the opening of the drainage canal what has been the condition of the water here?

A. The water has been very good in my estimation; it hasn't been bad at all.

Q. Has there been any odor or smell in the water either in winter or summer since?

A. No sir, not that I have noticed.

Q. How about the fish in the live-boxes?

A. The fish lived in live-boxes first rate last winter; I kept fish in live-boxes for two months and a half.

5680 Q. Are fish shipped from here to the Chicago market alive now?

A. Why in the winter season; not in the summer.

Q. Have the fishermen in this vicinity since the opening of the drainage canal, had typhoid fever?

A. I haven't known of a fisherman having it; I haven't known but one case in Chillicothe, in years and that wasn't a fisherman nor a river man.

MR. JEFFRIES: I object to that question as leading.

CROSS-EXAMINATION, By Mr. Jeffries.

Q. How long have you lived in Chillicothe?

A. My entire life, 33 years.

Q. And you have been fishing on and off for twenty years?

A. For twenty years; ever since I was big enough to ride a lead line.

Q. How far up the river have you fished from Chillicothe?

A. Well not more than eight miles I guess.

Q. And how far down the river from Chillicothe?

A. Peoria.

Q. How far is that?

A. In the neighborhood of twenty miles, I guess.

5681 Q. Are you acquainted with what is known as Peoria Lake?

A. Not a great deal; I haven't fished in there since I was a kid.

Q. You have been down the river to Peoria several times, or a great many times in the last five or six years have you not?

A. No not many times in the last five or six years; about once I think.

Q. Do you know how long Peoria Lake is?

A. No I can't say that I do.

Q. About how long?

A. I can't say that I do.

Q. Do you know where it starts at this end?

A. I think it starts right below the Narrows.

Q. You don't know how wide it is?

A. No I don't know; I couldn't say; I have heard them say it was a mile wide.

Q. Much longer than it is wide?

A. Yes.

Q. Now the river passing Chillicothe, flows through Lake Peoria and on past Peoria, does it not?

A. Yes sir.

Q. Lake Peoria is nothing more than a wide place in the river, is it?

A. That's all.

5682 Q. You say there was some scum on the river before the canal was opened?

A. Yes sir, there used to be a good deal of scum; it used to be very thick at times.

Q. You have seen considerable scum since the opening of the canal?

A. Not in the river; in the back water, at times.

Q. It was of a vegetable character, was it?

A. Yes sir.

Q. Now since the opening of the canal you have seen in the ordinary stages of the river water, a greasy, oily substance on the surface of the water haven't you?

A. No sir, only immediately below the Santa Fe Bridge here, at the time they was painting it; I saw greasy water there.

Q. Before the canal was opened the water was very sluggish?

A. Yes, the current was very slow.

Q. In fact at ordinary stages of the water there was scarcely nothing?

A. Hardly any.

Q. Now since the canal was opened, bringing the sewage of Chicago mixed with lake water, the current is very swift?

A. Yes sir, the current is a good deal swifter than it used to be.

5683 Q. How much swifter?

A. Well, I couldn't say as to that.

Q. Considerably, though, isn't it?

A. Yes sir.

Q. When you say the water is better now than it was before the canal was opened, you speak from observation?

A. Well from my experience on the water, it is clearer, and better looking, and a person can drink it in a pinch now and they couldn't at this time of year before.

Q. You say they can drink it?

A. Yes, I have drank this season and last season both, when I would be on the river.

Q. This moss, or green substance was caused from decayed vegetation, was it not?

A. I understood that is where it came from.

Q. Did it smell like it?

A. It smelled sour and stinking.

E. N. NELSON.

5684 Chillicothe, Illinois, July 23, 1903.

JESSE HORN,

called as a witness in behalf of the defendants, being first duly sworn by the Commissioner, was examined in chief by Judge Johns and testified as follows:

Q. What is your name, residence and occupation?

A. Jesse Horn; Chillicothe, Illinois; Occupation fisherman.

Q. How long have you fished upon the Illinois river?

A. Oh I have fished off and on for thirteen years.

Q. Over what portions of the river?

A. Between Hennepin and Peoria.

Q. What has been the condition of the Illinois river before the opening of the drainage canal?

A. Well in warm weather it was stagnated water and in cold weather when it was froze up we had plenty of gas under the ice; you couldn't hardly stand it if you cut a hole in the ice; and there used to be a good deal of malarial fever; I have had the malarial fever pretty nearly every year, malarial fever and ague. I missed it this year so far; I don't know whether that is on account of that or not; I belive it is, but as far as knowing, I don't know.

5685 Q. Before the opening of the drainage canal, what was the effect of the water upon the fish.

A. Why, it killed lots of fish, both winter and summer.

Q. Was there any green substance in the water before the opening of the drainage canal?

A. Yes sir.

Q. Describe it?

A. Why some called it clover and some called it shamrock here. Some say it was formed from the grass on the bottom; some say it forms from the willows; I don't know what; they claim that all stagnated water is that way; as far as I know it is.

Q. Since the opening of the drainage canal, what has been the condition of the water?

A. I think purer and clearer. We haven't had no dead fish floating around on the water, because of the water, there hasn't been no dead fish floating.

Q. Has there been any smell to it since the opening of the canal?

A. No sir.

Q. Since the opening of the drainage canal, do you know of any typhoid fever among the fishermen?

A. No sir.
5686 I know of years before that it has though.

CROSS-EXAMINATION,

By Mr. Jeffries.

Q. What years before was there typhoid fever?

A. Why every year, as long as I have been around here; it has been about 12 years that I have been here.

Q. How many cases?

A. Oh, several; I couldn't mention just exactly how many cases.

Q. Eight or ten?

A. Well not here, I don't think there was that many.

Q. Five?

A. Yes sir, I believe there was five every year.

Q. Where were those cases?

A. Right here in Chillicothe; not typhoid fever either, it was ague or malaria.

Q. You want to correct your statement then in your answer to Judge John's question when you stated that there was several cases before the canal was opened, of typhoid fever?

A. Well, I didn't mean typhoid fever; I meant the ague or malaria fever, typhoid fever is a different thing; I don't think that typhoid fever is caused from being on the river; I never knew of any fishermen having typhoid fever in my life, and I have known a good many.

5687 Q. Do you know what typhoid fever is?

A. No sir, I ain't no doctor or claim to be, or anything like that; I don't know as I ever knew a fisherman that had typhoid fever; that is, that I knew he had it.

Q. Then as a matter of fact you don't know whether there has been any typhoid fever here or not?

A. Well there has been typhoid fever in town.

Q. How many cases?

A. Why I couldn't answer how many cases; I don't think there was a great many at that.

Q. Fifteen or twenty cases in the last four or five years?

A. No, I don't believe there was.

Q. Ten?

A. No, I would be afraid to say that there was that many; I am not around the town very much; I am on the river pretty nearly all the time.

Q. How many cases could you mention?

A. Well I couldn't mention any, only what I have heard there was typhoid fever in town; that is all I know; I hardly ever am up in town in the evening; once in a week, within a block. I don't know as a matter of fact there is any; only what I hears sometimes, that there is typhoid fever at such and such a place, at Santa Fe or something like that.

Q. Then you don't know whether there has been or has not been typhoid fever in Chillicothe?

5688 A. No sir.

Q. There may have been and may not have been?

A. Yes sir.

Q. How far up the river have you fished?

A. Hennepin.

Q. This vegetable growth or moss or scum that formed on the water before the opening of the canal, and about which you have just testified, is some form of vegetation is it not?

A. Why I am pretty sure that it is, yes.

Q. You say it branches out in leaves like clover?

A. Yes, only smaller.

Q. Since the opening of the canal you have seen green scum on the river have you not?

A. I have seen it on the sloughs, not in the river, only what flows out of the sloughs.

Q. The current in the river is much more rapid since the opening of the canal than it was before the canal was opened?

A. Well, since the canal has been in it has been higher water than it was before.

Q. And therefore more current?

A. And therefore more current.

Q. Considerably more current?

5689 A. Yes sir, in high water, there is more current, the higher water you get the more current there is.

Q. Do you live in a house-boat?

A. No sir.

Q. Do you use the city water for domestic purposes?

A. No sir, I have got a well.

Q. Pump?

A. Yes sir.

Q. Sand pump?

A. No sir.

Q. Drive pump rather?

A. Yes sir; still the city has got good water.

JESSE HORN.

5690 Chillicothe, Illinois, July 23, 1903.

T. H. HARRIS,

called as a witness in behalf of the defendants, being first duly sworn by the Commissioner, was examined in chief by Judge Johns, and testified as follows:

Q. What is your name, residence and occupation?

A. T. H. Harris; Chillicothe, fisherman by occupation.

Q. How long have you been a fisherman on the Illinois river?

A. About ten years.

Q. Over what portion of the river have you fished?

A. Between Peoria and Lacon.

Q. State what you know about the water in the Illinois river before the opening of the dramage canal?

A. Well, it was very bad at times, especially in the winter time along in July and August.

Q. What was the matter with it in July and August?

A. Oh it would get kind of stagnated and a kind of a green color.

Q. Did it have any odor in those months?

A. Well, I don't know that it did.

Q. Was there any growth in the water or upon it?

A. Yes, I have seen what they call duck weed, floating in the river, a lot of it. 5691

Q. Is that weed sometimes called shamrock?

A. Well I never heard it called that; I don't know what the right name is for it; it is known by the fishermen as duckweed I guess.

Q. What was the condition of the water in the winter and its effect upon the fish?

A. Well it was pretty bad on the fish; I have seen the fish rush up into the spring holes as if struggling for life; the mouth of most any creek would be alive with fish; that is where fresh water was coming in.

Q. Was there any smell in the water in the winter?

A. Yes.

Q. How much and what kind?

A. Why it smelled considerable.

Q. Did the fish die under the ice?

A. Yes, I have seen lots of them die under the ice.

Q. What has been its condition since the opening of the drainage canal?

A. Why to my opinion the water is better than it used to be, especially in the winter.

Q. Do the fish die now in the water here?

A. No, I have never seen it since the canal has been turned in.

5692 Q. Is there any what you call duckweed now in the water?

A. I haven't seen any this year yet; it generally grows later in the fall.

Q. Has there been any since the opening of the drainage canal?

A. Yes, there was lots of it last fall.

Q. Where?

A. Why over through the bottoms here, and through Goose Pond; and around through there it was so thick in places you couldn't hardly go through it. It would be up next to the levee where the south wind would drive it up into the timber across the lake.

Q. Have you seen any in between the banks of the river since the opening of the canal?

A. No sir, I haven't.

Q. Have the fishermen upon the Illinois river since the opening of the canal, had typhoid fever?

MR. JEFFRIES: Objected to as leading.

A. Why I haven't heard of a case of it.

CROSS-EXAMINATION,

By Mr. Jeffries.

Q. There might have been some of it though?

A. There might have, yes; but I never heard of any of it.

5693 Q. Do you live here in Chillicothe?

A. Yes.

Q. Do you live in a house-boat?

A. No, I live up town on Third Street.

Q. Do you have a drive pump or do you use the water from the town hydrant?

A. From the hydrant and cistern water together.

Q. Where does the water come from that is in the cistern?

A. It comes off the roof when rain falls.

Q. Is it cemented?

A. Yes sir.

Q. You use water from that for household purposes?

A. Yes.

Q. Before the canal was opened, there was very little current in the river, wasn't there?

A. No, there wasn't very much here, no.

Q. Now since the opening of that canal and the flowing of sewage of Chicago mixed with lake water, there has been considerable increase in the current, has there not?

A. Yes.

Q. How much of an increase?

A. Well I couldn't state just how much; but there has been considerable, I know.

5694 Q. You see some dead fish floating in the river now, don't you?

A. No, not unless it is some that have been thrown out of live boxes or something like that.

Q. Aside from the green scum that forms on the water, and the vegetable growth there is practically no difference in the water now from what it was before the canal was opened?

A. Well, I think there is some difference in the channel of the water, but I don't know as there is much of that growth from back water.

Q. Well there is some forms in the back water now, is there not ?

A. To a certain extent, yes.

T. H. HARRIS.

5695 Chillicothe, Ill., July 23, 1903.

L. S. McCULLEY,

called as a witness in behalf of the defendants, being first duly sworn by the Commissioner, was examined in chief by Judge Johns and testified as follows:

Q. What is your name, residence and occupation?

A. L. S. McCulley, Chillicothe, Illinois, Engineer.

Q. How long have you been an engineer?

A. Somewhere near six years.

Q. Are you a stationary engineer?

A. Yes sir.

Q. Have you been an engineer upon the boats running upon the Illinois river?

MR. JEFFRIES: Objected to as leading.

A. Yes sir.

Q. If you have been an engineer at elevators, you may state where and when?

A. Engineer here at this Turner-Hudnett Company, for four years.

Q. What water did you use in your boilers when you were running boats upon the Illinois river?

A. Illinois river water.

5696 Q. Over what portion of the river have you run as an engineer on boats?

A. From Copperas Creek to Henry and above; Hennepin is as far above as I would get.

Q. Were you an engineer between those points upon boats both before and after the opening of the drainage canal?

A. Yes sir.

Q. How did the water act in your boilers before the opening of the drainage canal, below Peoria?

A. Well it foamed slightly, and at times strong; closer to Peoria stronger than it did below.

Q. What causes water in a boiler to foam?

A. Why, it is pollution.

Q. Below Peoria was there before the opening of the drainage canal, any smell to the steam that escaped from the boiler?

MR. JEFFRIES: Objected to as leading.

A. Yes sir.

Q. Could you describe that smell?

A. Well about the only way that I could describe it would be that it had a real strong odor, decayed matter.

Q. Since the opening of the drainage canal and below Peoria what has been the action of the water in the boilers?

A. It has been quiet and clear—

Q. I am asking you below Peoria?

5697 A. Yes sir.

Q. Has it foamed any below Peoria since the opening of the canal?

MR. JEFFRIES: Objected to as leading.

A. No sir.

Q. Before the opening of the drainage canal, and above Peoria, what has been the action of the water in the boilers?

A. Foaming.

Q. Was there any odor to the steam?

A. Yes sir.

Q. Since the opening of the drainage canal and above Peoria, what has been the action of the water in the boilers?

A. It has been quiet.

Q. Has there been any foaming or odor in it?

A. No sir, no odor any more than comes from natural clear water; of course there is an odor from that.

Q. Since the opening of the drainage canal, which has been the better water for steaming purposes; that below Peoria or that above?

A. Well there has not been much difference; above is the best a little.

Q. Before the opening of the drainage canal, which was the better water for steaming purposes, that below or above Peoria?

A. Above Peoria.

5698 Q. At what places have you been an engineer on boilers on the shore of the Illinois river?

A. At Chillicothe.

Q. In what kind of a building?

A. Elevators.

Q. Were you an engineer here before the opening of the drainage canal?

A. Yes sir.

Q. From what source did you obtain the water for your boilers?

A. From the river.

Q. Before the opening of the drainage canal at this point, what was the action of the water in your boilers?

A. Foaming.

Q. Was there an odor to the steam?

A. Yes sir.

Q. If that odor varied in its strength or amount, at what season of the year was it strongest?

A. In the summer.

Q. Since the opening of the drainage canal, what has been the condition of the waters in the boilers here at the elevator?

A. It has been better, no foaming; not as much lime or scale.

Q. Has there been any odor in the water that you have noticed?

A. No sir.

5699 Q. How about the lime and scale in the boilers before the opening of the drainage canal from the water below Peoria?

A. There was a great deal of it.

Q. And after the opening of the drainage canal and below Peoria?

A. Not as much.

CROSS-EXAMINATION,

By Mr. Jeffries.

Q. There is more or less odor to all steam is there not?

A. It depends on the water. There is an odor to steam, yes sir, of course; naturally clear water there is an odor.

Q. The water in your boiler here at the elevator didn't foam very badly did it, prior to the opening of the canal?

A. At times it did, yes sir.

Q. You used the water from the river altogether?

A. Yes sir, excepting some that we put in a tank and run the water from the roof and we washed mostly with that, and soft water.

Q. If the water had foamed very badly, at any time, it would have been an item of very little expense to have driven a well would it not?

A. Well I couldn't tell you that; I am working for the company; it is their look out.

5700 Q. They never suggested anything of that kind to you nor you to them?

A. No sir.

Q. The foam which is created in the boiler, came from decayed vegetable matter did it?

A. To a certain extent.

Q. To a very large extent?

A. It comes more from decayed matter, yes sir, than it does from clear water; clear water don't foam.

Q. I am talking now of the substance in the water which caused the foam and that was decayed vegetable matter was it not?

A. Not altogether.

Q. Well, what was it?

A. Well, the pollution in the water.

Q. The pollution was caused by the decayed vegetable matter in the water, was it not?

A. Partly.

Q. Wasn't it almost solely from that source?

A. No. Stagnant water will make a foam.

Q. Was the water in the Illinois river stagnant at that time?

A. At what time do you speak of?

Q. At the time when it would foam in the boilers?

A. Yes sir.

Q. Both above and below Peoria?

5701 A. Yes sir.

L. S. McCULLEY.

Adjourned until 9:30 A. M., following day, Friday, July 24, 1903, at Lacon, Illinois.

5702 Lacon, Illinois, July 24, 1903. 9:30 A. M.

Continuation pursuant to adjournment. Present, the Commissioner and same counsel representing the respective parties.

WILLIAM MANGLE,

called as a witness in behalf of the defendants, being first duly sworn by the Commissioner, was examined in chief by Judge Johns and testified as follows:

Q. State your name, residence and occupation?

A. William Mangle; Lacon, Illinois; fisherman.

Q. How long have you been a fisherman on the Illinois river?

A. About eighteen or twenty years.

Q. Over what portions of the river have you fished?

A. Between Henry and Chillicothe, all the time.

Q. How far is Lacon from Henry?

A. About seven miles?

Q. How far by river is it from Peoria?

A. 29 miles I think.

Q. How far from La Salle?

A. About forty.

5703 Q. What was the condition of the Illinois river at this point before the opening of the drainage canal in January, 1900?

A. The water was pretty low.

Q. Did it have any matter floating in it or growing in the river?

MR. JEFFRIES: Objected to as leading.

A. Yes, a kind of a moss or green stuff floating in it in low water.

Q. What did you call that stuff?

A. Well we never had any name for it.

Q. Did it have three little leaves?

A. Yes sir.

Q. And a little root an inch or so long?

A. Yes, like a kind of a duck seed.

Q. State what was the condition of that stuff, whether it covered the water and how much there was of it, tell all about it?

A. It would probably be a foot deep along the shore.

Q. Was there any smell in the water in summer?

A. No not in summer to amount to anything.

Q. Did the river freeze over here in the winter?

A. Yes sir.

Q. What was the condition of the water under the ice?

5704 A. It was pretty bad when the water was low—gassy.

Q. When you cut a hole in the ice what occurred as to the stench or smell?

A. A kind of a gas or tar smell.

Q. What effect did it have upon the fish?

A. Well the fish would taste just like it smelled, especially catfish.

Q. Did the fish die under the ice here?

A. Yes, a good many.

Q. How did they live in live boxes?

A. Do you mean—

Q. Before the drainage canal was opened?

A. Well they didn't live long in hot weather; they died fast.

Q. Since the opening of the drainage canal, has there been any of this green plant in the water?

A. Not very much; a kind of a scum.

Q. Is there any smell to the water under the ice here since the opening of the drainage canal?

MR. JEFFRIES: Objected to as leading.

A. No sir.

Q. How is the water here now since the opening of the drainage canal as compared with the water before the opening of the drainage canal, better or worse?

A. Well, the water is better, a good deal and the fish live better. 5705

Q. Prior to the opening of the drainage canal did you drink the water of the Illinois river when fishing?

A. Oh, we drank it in fall, in the cold weather.

Q. Since the opening of the drainage canal do you drink the water?

A. We would in cold weather; not at any other time.

Q. Have the fishermen in this vicinity since the opening of the drainage canal had typhoid fever?

MR. JEFFRIES: Objected to as leading.

A. No sir, not that I know of.

CROSS-EXAMINATION,

By Mr. Jeffries.

Q. How far up the river did you say you were acquainted with it?

A. Oh, I have fished on it from Henry to Chillicothe; I have been up further than that though.

Q. What is the population of this town?

A. 1200.

Q. What is the name of the town?

A. Lacon.

Q. Have they a system of water works?

A. Yes sir.

Q. Where do they get their water?

5706 A. From wells.

Q. Driven wells?

A. Yes sir.

Q. How deep under the surface of the earth are these wells driven?

A. I don't know how far it is drove, I couldn't tell you.

Q. What is your judgment, 100 feet?

A. No, not over forty feet.

Q. How far is the well located from the river?

A. About 600 yards.

Q. Do you know the character of the soil through which it is driven?

A. Gravel.

Q. And sand?

A. Gravel and sand.

Q. Now, aside from this public well, from which the town gets its supply, there are a number of private driven wells, are there not?

A. No, there is lots of good wells in town, they are not driven though.

Q. They are living wells?

A. Yes sir.

Q. The people living in this town, in Lacon, use the water from these wells for domestic and drinking purposes, do they not?

5707 A. Yes sir.

Q. They don't use the water from the river for domestic and drinking purposes?

A. No sir.

Q. Since the opening of the Chicago drainage canal you have noticed considerable green scum here on the river at Lacon have you not?

A. There is a scum on the water now at present.

Q. It is a different kind of a scum from what it was before the canal was opened, isn't it?

A. Why, it is just a kind of a thin scum instead of them seeds.

Q. Kind of an oily substance?

A. Yes.

Q. Are you a man of family?

A. No sir.

Q. Before the canal was opened. there was very little current in the river, was there?

A. Very little.

Q. At times none?

A. When the water was low there was hardly any current.

Q. Since the opening of the Chicago drainage canal and the running of the water of Lake Michigan mixed with the sewage of Chicago down the Illinois river, the current has
5708 grown very much stronger?

A. Yes sir.

Q. How much stronger?

A. I couldn't say just how much; there is quite a good current, though, all the time.

Q. You say there has been no typhoid fever?

A. Not that I know of.

Q. Do you know that there has not?

A. I don't know; I am not sure.

Q. You know very little about the character of sickness among the people?

A. Very little.

Q. They may have had it and may have not?

A. If there was any around a small town I would be apt to hear about it.

Q. How long have you been fishing?

A. About eighteen years, something like that.

Q. How old are you?

A. Thirty-five.

Q. Is there a good current in the river now since the opening of the canal?

A. Yes sir.

Q. From Henry to Chillicothe?

A. Yes sir.

5709 Q. The scum that formed on the river before the canal was opened, was of a vegetable growth was it not?

A. It seemed to me kind of a seed.

Q. Kind of a water grass or weed?

A. A kind of a little green seed; kind of a little green leaf, it started that way.

Q. It doesn't start that way now?

A. There is hardly any of it now.

Q. Now since the canal was opened, you can smell an odor from the water can't you?

A. Well if a steamboat stirs it up I believe you can smell a kind of a smell to it.

Q. Considerable smell you mean?

A. Kind of a dead smell.

WM. MANGLE.

5710 Lacon, Illinois, July 24, 1903.

JOHN BAUMISTER,

called as a witness in behalf of the defendants, being first duly sworn by the Commissioner, was examined in chief by Judge Johns and testified as follows:

Q. State your name, residence and occupation?

A. John Baumister, Lacon, Illinois; fishing.

Q. How long have you been a fisherman on the Illinois river?

A. Since 1867.

Q. Over what points have you fished?

A. From above Hennepin down the river as far as Pearl.

Q. When did you fish below Peoria?

A. Well it has been fifteen years ago since I have been below. Didn't do very much fishing below Peoria.

Q. Did you ever run upon the boats?

A. Why yes; we have a little tug of our own. Before they turned that canal in the water used to foam and we had to blow her out every two days, and last year we never had to blow her out once, so the water must be purer.

Q. Before the opening of the drainage canal was there any smell to the steam in the boilers?

A. No I don't know as I ever noticed any smell from the boilers much. The water was bad in the river though; some seven or eight years ago the fish and clams very near all died along here, and we had to hire men to bury the fish along this bank. 5711

Q. Was there a kind of green plant growing in the water here?

A. Yes, what they called duck seed growed awful thick in some places; you couldn't hardly seine through it; there ain't been very much of that lately; very little.

Q. Before the opening of the drainage canal was there a smell in the river water when the river was frozen over?

A. Yes, when it was frozen over a short time the water became gassy and smelled and the fish tasted tarry so we couldn't eat them; frying them in a room you would have to pretty nearly stay out.

Q. Since the opening of the drainage canal has there been any odor under the ice here at Lacon?

MR. JEFFRIES. Objected to as leading.

A. No, I never noticed any myself.

Q. Do the fishermen in this vicinity since the opening ot the drainage canal have typhoid fever here?

MR. JEFFRIES: Objected to as leading.

A. No, I don't know of any.

5712

CROSS-EXAMINATION,

By Mr. Jeffries.

Q. How old are you?

A. On the first day of January I will be 60.

Q. How long have you lived here at Lacon?

A. I came here in the fall of 1857.

Q. How long have you been fishing?

A. Since 1867.

Q. How far up the river have you fished?

A. About two or three miles above Hennepin.

Q. How far is Hennepin from here?

A. Twenty-one miles.

Q. How far down the river have you fished?

A. Well the most of the fishing I done, was between here and Peoria; I was down as far as Pearl one summer.

Q. The principal part of your fishing has been done between what points?

A. Between Hennepin and Peoria.

Q. You are a man of a family are you?

A. Yes sir.

Q. Do you live on the river or in a dwelling house?

A. I live in a house.

Q. How far from the river?

A. The first house up here on the bank.

5713 Q. Have you a drive well at your house?

A. No, we have a living well.

Q. Do you use the water from that well for living purposes?

A. Yes sir, and all the neighbors around there; the doctor says it is the best water in town.

Q. The people in your neighborhood and in the town and so far as you know, don't use the water from the river for domestic and drinking purposes do they?

A. Well no, not right around here; take it further up town they have got to use water anyhow from the pump-house; but then it is all well water; it is right at the river there.

Q. How deep is this town's well?

A. One is drove; I don't know, it must be drove eighty feet and the one dug must be forty feet.

Q. Do you know the character of the soil through which this well is dug and the one that is driven?

A. No, I don't know.

Q. Is it sand and gravel?

A. It is gravel quite a ways, but I don't know how far; it must be gravel thirty or forty feet.

Q. How far are these town wells from the river?

A. Well the waterworks well—

Q. How many feet about?

5714 A. Well from the main river about one thousand feet, but from the slough it wouldn't be over a hundred.

Q. The water in this slough here at the town, gets very stagnant, even since the opening of the canal doesn't it?

A. No, not very, this slough water is just the same as the river water; and after the water gets low it becomes a pond, and then there is no more outlet to it and it becomes stagnant.

Q. And forms a scum?

A. Yes sir.

Q. The green scum that formed on the river before the canal was opened, was of a vegetable character was it not?

A. Yes, it was duck seed, that's about all; it made a light green scum; but mostly it was duck-seed.

Q. What is the character of the scum that forms now?

A. Well it would be about the same, but not near as much of it.

Q. Before the canal was opened, when the water was at an ordinary stage, there was very little current in the river was there?

A. Well there was no current to speak of at all.

Q. Since the opening of the Chicago drainage canal there has been a good current at all times in the year?

A. Yes sir.

Q. From Hennepin to Peoria?

5715 A. Yes sir.

JOHN BAUMISTER.

5716 Lacon, Illinois, July 24, 1903.

WILL REED,

called as a witness in behalf of the defendants, being first duly sworn by the Commissioner, was examined in chief by Judge Johns and testified as follows:

Q. What is your name, residence and occupation?

A. Will Reed; Lacon, Illinois, Marshall County; fisherman principally.

Q. What other occupations have you followed?

A. Firing.

Q. On stationary engines or locomotive engines?

A. On steamboats; steamboat and stationary both.

Q. On what steamboats have you been fireman?

A. The first boat I ever fired on this river was on the Rex.

Q. How much of the time have you been occupied as a fireman on the Illinois river?

A. Well pretty much every summer, more or less.

Q. How far have you traveled up and down the river in that occupation?

A. Well sir, I have traveled from Peoria to La Salle and from Peoria to St. Louis on the Cherokee.
5717 I did make a trip or two on the Bald Eagle.

Q. Did you notice any difference in the quality of the water for steam purposes above and below Peoria?

A. Yes sir.

Q. What was the difference before the opening of the drainage canal?

A. Well sir, from the time you leave Peoria; of course after you get past them still houses down there it is all right. For a ways after you hit them still houses it is bad; that is, it would foam and it was foam up here; it was a kind of a scum raised up in your boiler and made it foam.

Q. How far below Peoria would you notice that foaming in the boiler?

A. Oh, until we got down pretty near to Copperas Creek.

Q. From Copperas Creek down to the mouth of the river was the water better for steaming purposes?

A. It certainly was; we was bothered more with sand in the boilers; the water was mud run; more sandy the water was.

Q. Was there any foaming in the boiler below Copperas Creek dam?

A. Yes, sir, at times.

Q. How was the water below LaGrange dam as compared with the water above Copperas Creek dam?

A. I think it was better above; that is, the quality of the water.

5718 Q. How was the water below Kampsville dam as compared with the water above Copperas Creek?

A. Well, I think it was better; couldn't see much difference in it.

Q. From Kampsville dam down the river, did the water foam in the boilers?

A. More or less, yes; after we got down about Alton there and got down below there.

Q. After you got into the Mississippi?

A. Yes.

Q. In the Illinois river below Kampsville and down to Grafton did the water foam in the boiler?

A. It foamed more or less, yes; there wasn't no big amount of foaming or anything of the kind.

Q. Now, above Peoria and before the opening of the drainage canal how did the water operate in the boilers?

A. It foamed.

Q. Which was the better water for steaming purposes before the opening of the drainage canal—the water in Peoria Lake or the water at Lacon?

A. Why, I think the water at the present time—

Q. No, before the opening of the drainage canal?

A. Oh, it was better here at that time.

5719 Q. Before the opening of the drainage canal, what was the condition of the water at this point as noticed by you as a fisherman?

A. Well, I have seen it pretty bad here at times.

Q. In what way?

A. Well, in scum and one thing and another; seeds are apt to be in the river at any time.

Q. Was there a smell in the water?

A. Yes, sir.

Q. What was it like?

A. Well, it wasn't a very pleasant smell.

Q. What was the condition of the water under the ice in the winter?

A. It was pretty foul.

Q. What effect did it have upon the fish?

A. It killed lots of fish along the river between here and Henry.

Q. Were the fish fit to be cooked?

MR. JEFFRIES: Objected to as leading.

A. No, sir.

Q. After the opening of the drainage canal were you on steamboats as a fireman below Peoria?

A. No, sir.

Q. Since the opening of the drainage canal have you been a fireman on the Illinois river above Peoria?

5720 A. Yes, sir.

Q. What has been the condition of the water for steam purposes above Peoria since the opening of the drainage canal?

A. First rate.

Q. Is there a foaming in the water?

MR. JEFFRIES: Objected to as leading.

A. I haven't had no foaming; every time I was firing I never seen none of it.

Q. Since the opening of the drainage canal, what has been the condition of the water as to odor or smell when the river was frozen over?

A. I didn't find any.

Q. Have the fish died in the water?

A. I haven't seen any.

Q. Before the opening of the drainage canal how did the fish live here in live boxes?

A. Not very good.

Q. How do they flourish in that respect since?

A. Well, from what experience I had, I could hold them four and five days.

Q. Has there been any considerable amount of this green plant that you call duck seed, in the river since the opening of the canal?

A. No, I don't think there has been.

5721 Q. Do the fishermen upon the Illinois river in this vicinity have typhoid fever?

MR. JEFFRIES: Objected to as leading.

A. Why, not that I know of.

CROSS-EXAMINATION, by Mr. Jeffries.

Q. How long have you lived here at Lacon?

A. Thirty years; I have lived off and on.

Q. How old are you?

A. Thirty-six years old; I was born in 1867.

Q. You are not an engineer?

A. Why, no; I am not an engineer; I have run an engine, though, at times.

Q. But not on the river?

A. No; that is, I have helped while the man was getting his meals.

Q. Before the canal was opened there was very little current in the river here at Lacon?

A. Very little current; in the spring of the year, yes.

Q. But at times there was very little current?

A. Yes, to amount to anything.

Q. Since the canal was opened, and the Chicago sewage mixed with lake water has been turned into the Illinois 5722 river, there is a good current at all times in the river?

A. We have got a good fair current, yes, sir.

Q. Since the opening of the Chicago drainage canal, you have noticed here at Lacon considerable of the green, oily, greasy scum that forms on the river?

A. Not since the canal was opened, no, sir.

Q. Isn't it a fact that there is a green scum on the river right out here where this boat stands now?

A. It may be, I have never been down to examine it; I am only giving you my opinion of what I know.

Q. Well, you know that that oily green scum does form on the river since the opening of the canal, right here where this boat stands?

A. I don't know; I haven't looked at it.

Q. You do know that it does since the opening of the canal?

A. No, I don't think it has.

Q. I wish you would go out there and look at it and see if you don't see some of it?

(Witness steps out to rail of boat and looks.)

A. There is some there, yes, sir.

Q. It looks kind of like goose grease?

A. No, I don't know whether you woudl call it goose grease or not; it is a kind of a scum; it isn't very bad at that.

Q. It isn't a vegetable growth, is it?

A. I don't know.

5723 Q. It hasn't that appearance?

A. I don't know but it has.

Q. Don't you know that it has not the appearance of vegetable growth?

A. I don't know; I couldn't say that it hasn't or couldn't say that it has.

Q. Was it a vegetable growth prior to the opening of the canal?

A. I don't know as it was; it was not as yellow as that is.

Q. Are you a married man?

A. No, sir.

Q. Do you have a well at your house or do you use the hydrant water?

A. No, sir; I use a cistern. WILLIE REID.

5724 Lacon, Illinois, July 24, 1903.

FRED. MAWBEY, called as a witness in behalf of the defendants, being first duly sworn by the Commissioner, was examined in chief by Judge Johns and testified as follows:

Q. What is your name, residence and occupation?

A. Fred. Mawbey; Lacon, Illinois; fisherman.

Q. How long have you fished upon the Illinois river?

A. Twenty-five years or more.

Q. Over how much of the river have you fished?

A. I fished from LaSalle, as far as below Naples.

Q. Did you fish below Peoria before the opening of the drainage canal in 1900?

A. Yes, sir.

Q. At what point?

A. Havana.

Q. Describe the condition of the Illinois river at Havana before the opening of the drainage canal?

A. Why, the conditions were bad; there was a white slime in the water that collected on the nets.

Q. To what extent, what amount of it?

A. Why, lots of it; even if you laid a rope across the 5725 river, the rope would fill up with it; the nets would fill up so that two men could hardly lift them—a net that ought not to weigh over 75 pounds.

Q. What was the condition of the Illinois river in this neighborhood before the opening of the drainage canal?

A. It was bad.

Q. Describe it?

A. Well, through the summer season it would be green in fact from top to bottom and in the winter season, take it above Henry dam, it would take it about eight to ten days to kill every fish in it.

Q. Was there a smell in the water in the summer?

A. Yes, sir.

Q. Was there a smell in the water in the winter?

A. Yes, sir; I have seen it so you would have to cover your face when you went across the bridge at Henry dam.

Q. What effect did that water have upon the taste of such fish as lived?

A. Why, the fish tasted gassy; you couldn't eat them at all, nor you couldn't stay in the house where they were cooked.

Q. Since the opening of the drainage canal, what has been the condition of the river in this vicinity?

A. It has been good.

5726 Q. Has there been any smell or odor in the river here in winter or summer?

A. None whatever that I know of.

Q. Do the fishermen on the Illinois river in this vicinity since the opening of the canal, have typhoid fever?

A. No, sir, not that I know of.

CROSS-EXAMINATION, by Mr. Jeffries.

Q. Did they have typhoid fever before the canal was opened?

A. Well, I couldn't say; there was lots of ague, though.

Q. Well, you could come just as near saying as to that question before the opening of the canal as you can since, on the question of typhoid fever?

A. Well, I never seen anybody have any typhoid fever along the river.

Q. Neither before nor after the opening of the canal?

A. No, sir.

Q. Did you ever see them have it in any other place?

A. Yes, sir; I have seen them have it in town.

Q. What town?

A. Lacon.

Q. Very much of it?

A. No, sir.

5727 Q. Since the canal was opened?

A. There was a man died with it here day before yesterday.

Q. How many cases have you had since the canal was opened here?

A. That is the only one that I know of.

Q. You don't remember of any before the canal was opened?

A. No.

Q. You live here in town?

A. Yes, sir.

Q. Do you live on the river or up in town?

A. Right up here on the edge of the river.

Q. Do you live in a house-boat?

A. Yes, sir; it is up on the bank, though.

Q. What was the condition of the current in the Illinois river before the Chicago drainage canal was opened?

A. In low water there wasn't any current to speak of.

Q. What is the condition of the current now, since the opening of the canal?

A. Why, it is good.

Q. At all times?

A. Yes, sir.

Q. This green scum that you speak of as forming on the river prior to the opening of the canal, was mostly in the
5728 dead water, was it not?

A. No, sir, it was in the river; the river was just about the same as dead water; it was dead; there was no current. If it was not for the steamboats running in it, I don't believe you could live on it; they stirred the water up.

Q. It was of a vegetable growth, wasn't it, this scum?

A. Well, no; I have seen the water, you could take a sixteen foot oar and stir it up, put it down and it would come up green. Of course seeds would form on it at times; I have seen them at times from Henry to Lacon, two foot deep.

Q. The low places along the river are grown up with heavy vegetation, are they not?

A. I don't quite understand you.

Q. Why, the banks of the river and the low lands?

A. Yes.

Q. Even out into the water?

A. Yes.

Q. How is it since the opening of the canal?

A. Why, it is better.

Q. There is still vegetation, is there not?

A. Not very much.

Q. There is considerable scum, is there not?

A. No, not much; not unless you go into the slough.

Q. There is some right out here today, isn't there?

5729 A. I didn't look this morning. This river never was any better than it is now.

Q. When you say the water is better since the opening of the canal than it was before, you judge from its appearance?

A. Yes, and the clearness of it.

Q. From its looks?

A. Yes, sir.

FRED. MAWBEY.

5730 Lacon, Illinois, July 24, 1903.

HENRY STOEHRS, called as a witness in behalf of the defendants, being first duly sworn by the Commissioner, was examined in chief by Judge Johns and testified as follows:

Q. What is your name, residence and occupation?

A. Henry Stoehrs; Lacon, Illinois; engineer at the woolen mills.

Q. How long have you been an engineer at this point?

A. Twenty years, about.

Q. How much of that time have you obtained water for your boilers from the Illinois river?

A. About twelve years.

Q. Have you been in any other plant than the woolen mills in that twelve years?

A. No, sir.

Q. How far from the river is the engine room of the woolen mills?

A. I should think about a thousand to 1200 feet.

Q. How is the water obtained from the river for the boilers?

A. Pumped.

5731 Q. What was the condition of the water in the Illinois river for steaming purposes, before the opening of the drainage canal?

A. Well, sir, it used to be very slimy, scummy, muddy.

Q. How did that act in the boiler?

A. Well, sir, it didn't act very good in the boilers; it foamed the boilers and we would have to blow them off pretty often.

Q. Was there a smell to the steam when you blew them off?

A. Yes, sir.

Q. What was the condition of the stuff that came out of the boilers when you blew them off?

A. Well, sir, it was a kind of a muddy scum, with an awful smell to it.

Q. Since the opening of the drainage canal?

A. It is better. I don't find that scum in them at all and haven't.

Q. Does the water foam in the boilers?

MR. JEFFRIES: Objected to as leading.

A. No, sir, very little; very little in the boilers.

Q. Is there any odor in the steam now?

A. No, sir.

Q. What is the character of the water that comes off when you blow off the boilers now?

A. Well, sir, it is in very good order; there is very little mud and very little scale.

5732 CROSS-EXAMINATION, by Mr. Jeffries.

Q. Have you lived here in Lacon all the time for twenty years?

A. Twenty years, yes, sir.

Q. What part of the town do you live in now?

A. The north part of the town.

Q. Near the river?

A. About six blocks from the river,

Q. Where do you get the water that you use for domestic purposes at your house?

A. We get it out of the city well here.

Q. How deep is the city well?

A. Why, I did hear, but I can't really—it is about twenty-five or thirty feet.

Q. How far is it located from the river?

A. Well, I think about a thousand feet.

Q. What is the character of the soil through which it runs?

A. Gravel.

Q. And sand?

A. Sand and gravel, yes.

Q. The people living in Lacon don't use the water from the Illinois river for domestic purposes and drinking purposes?

A. No.

5733 Q. Before the canal was opened, the water in the river was very sluggish, was it not?

A. Oh, it was awful.

Q. Scarcely no current?

A. No current.

Q. How is it since the canal was opened?

A. Better.

Q. There is a good current at all times of the year now?

A. Seems to be a good current.

Q. The water foamed in your boilers only in the summer time before the canal was opened?

A. Oh, yes, summer and winter.

Q. How far is your boiler house located from the river?

A. Well, I think about 1200 feet.

Q. There was no occasion for digging a well, was there, or driving one to get water for the boilers?

A. No, sir.

Q. The water in the river was not so bad that you couldn't use it for that purpose?

A. No, sir; I don't think it was.

Q. Do you know whether or not the foaming of the waters was caused from vegetable decay or what?

A. I do not.

5734 Q. The green scum that formed on the river before the canal was opened was of a vegetable character, was it not?

A. Yes.

Q. Since the opening of the canal there has been and is now, today, and at various times, an oily, greasy scum on the river?

A. That is before the canal.

Q. And since?

A. I haven't saw it since.

Q. Isn't there some today right out here near this boat?

A. I haven't saw it.

Q. You haven't noticed it very closely then?

A. No, sir.

Q. You are not on the river very much?

A. Not on the river very much; I am no fisheman.

Q. You don't drink the water from the river, do you?

A. No, not as long as we have got well water, we don't drink river water.

Q. What is the reputation of the water in the Illinois river for drinking and domestic purposes?

A. Well, I have heard and read that it was pretty good during the last two years.

Q. You have heard it condemned also, haven't you?

A. Well, I have.

5735 Q. You don't know of anybody that uses it?

A. No, I don't.

HENRY STOEHRS.

5736 Lacon, Illinois, July 24, 1903.

JOHN FAY, called as a witness in behalf of the defendants, being first duly sworn by the Commissioner, was examined in chief by Judge Johns, and testified as follows:

Q. What is your name, residence and occupation?

A. John Fay; Lacon, Illinois; fisherman.

Q. How long have you been a fisherman on the Illinois river?

A. Off and on about fifteen years.

Q. Over what points have you fished on the river?

A. Well, fished in the river at Chillicothe and Peoria and down as far as LaGrange.

Q. When did you fish below Peoria?

A. Well, it has been about ten years, I guess.

Q. What was the condition of the Illinois river at LaGrange when you fished there?

A. Well, the water was pretty high when I was at LaGrange; the water was pretty fair then.

Q. Did you fish any at Copperas Creek dam?

A. No, sir.

Q. What was the condition of the Illinois river at this point prior to the opening of the drainage canal?

A. Well, the water was pretty bad, take it in the winter time.

5737 Q. In what respect?

A. Well, it kind of smelled after you cut open the ice; kind of a gassy, tarry smell.

Q. What effect did it have upon the fish?

A. Well, it killed a good many fish in the river; when it didn't kill them they tasted tarry, kind of tarry.

Q. Were the fish themselves tainted, so that they would smell when they were cooked?

A. No, they didn't smell; but they would taste; tasted with a tarry taste.

Q. Now, since the opening of the drainage canal, what has been the condition of the Illinois river in this vicinity?

A. Well, it has been better than what it has been.

Q. Have the fish died here in the water since?

A. No, sir.

Q. Has it had the smell you have described, or any other smell?

A. No, sir.

Q. Has there been much, if any, of that green growth in the water since the opening of the canal?

MR. JEFFRIES: Objected to as leading.

A. No, sir.

Q. As to this green growth in the water how was it before the opening of the drainage canal?

5738 A. Well, there was a good many duck seed on the river before the drainage was opened?

Q. Since the opening of the drainage canal, have the fishermen upon the Illinois river in this vicinity had typhoid fever?

MR. JEFFRIES: Objected to as leading.

A. No, sir.

CROSS-EXAMINATION, by Mr. Jeffries.

Q. Did they have typhoid fever before the canal was opened?

A. Not as I know of; I don't know as any fishermen had it.

Q. They may have had it since the opening of the canal?

A. Not as I know of.

Q. How far up and how far down the river from Lacon have you fished?

A. Well, about five miles each way.

Q. How long did you say you had been fishing?

A. About fifteen years, off and on.

Q. You say the fish were not good before the canal was opened?

A. In the winter time they was not good; they had a kind of a tarry taste to them.

Q. You kept right on fishing?

A. No, we pulled up our nets when they got so bad.

5739 Q. What was the condition of the current in the Illinois river before the drainage canal was opened?

A. Well, there is a good deal of difference in the current now; more current in the river than there was then.

Q. What was the condition then?

A. Well, it was pretty dead water then.

Q. No current?

A. No, sir.

Q. What is the condition since the opening of the canal?

A. Well, there is a good current here now; pretty fair.

Q. This green scum that formed on the river before the canal was opened, was of a vegetable nature, was it not?

A. That grows on the water.

Q. You notice some of the green scum yet, do you not?

A. Yes, there is a little green scum.

Q. It is not of the same character now as it was before the canal was opened, is it?

A. No, sir.

Q. It has a kind of an oily appearance now, hasn't it?

A. Yes, there is more oil to it now.

Q. Is there a good current in the river over the whole distance that you have been fishing lately, and since the opening of the drainage canal?

A. Yes, sir.

JOHN FAY.

5740 Lacon, Illinois, July 24, 1903.

WILLIAM V. McKINLEY, called as a witness in behalf of the defendants, being first duly sworn by the Commissioner, was examined in chief by Judge Johns and testified as follows:

Q. State your name, residence and occupation?

A. William V. McKinley; Havana, Illinois; my occupation is engineer.

Q. Have you been an engineer upon boats on the Illinois river?

A. Yes, sir.

Q. For how long a time?

A. Well, I have been a licensed engineer since 1884.

Q. Did you run engines upon the Illinois river before 1884?

A. Yes, sir.

Q. For how long a time?

A. Oh, I suppose five or six years; that is I wasn't first engineer, but I was assistant under my father.

Q. During that time in what service have you been, who have been your employers?

A. I was with my father, I don't know how long; and in 1886 I went ashore; I was on shore for four years, and
5741 in 1891 I went back on the river and I was running from Alton to St. Louis and up this river.

Q. Have you been in the employment of the Illinois State Fish Commission?

A. Yes, sir.

Q. For how long a time?

A. Since 1894; not continually; I was off two years, last year and the year before.

Q. While you were in the employment of the fish commission did you run their boat upon the river?

A. Yes, sir.

Q. What have been the various boats that you have run, by name?

A. I was on the City of Havana, The Josie, The Dick Clyde and the G. M. Sibley, The Iowa, The Belle of Ottawa, The Lotus, The Reindeer, and The Illinois.

Q. How many of those boats have been the boats in the service of the Fish Commissioners of Illinois?

A. Three of them—well the Illinois and Reindeer are practically the same boat with a new hull, under the cabin. This is the Reindeer's cabin with a new hull under it and it is called the Illinois.

Q. During your employment by the fish commission have you traveled the whole length of the Illinois river?
5742 A. As far as navigable with our boats.

Q. Have you at various times been on the bayous, and tributaries and lakes tributary to the Illinois river?

A. Yes, sir.

Q. Do you think that you are familiar with the waters of the Illionis river?

A. Well, I don't know as I could tell it from any other water; that is I could tell it from rain water, but I couldn't go and pick out Illinois river water in a bunch of water.

Q. Do you know the general condition of the river at different times of the year, and all along the river?

A. Yes, sir.

Q. Does the Illinois river scour or clean itself in any of its stretches or reaches, and if so, in what one?

MR. JEFFRIES: I object to the question because it is leading and suggestive and because the witness has not properly qualified himself as a hydraulic engineer or otherwise so as to be sufficiently informed on the subject to give an opinion that could be relied upon or that would be valuable as testimony.

A. Not to any extent, no, sir; not to amount to anything.

Q. Does the river change its channels in any of its stretches?

MR. JEFFRIES: Objected to as leading.

A. No, sir.

(Witness temporarily withdrawn by consent of all parties.)

5743 Lacon, Illinois, July 24, 1903.

J. W. POTTS, called as a witness in behalf of the defendants, being first duly sworn by the Commissioner, was examined in chief by Judge Johns and testified as follows:

Q. What is your name, residence and occupation?

A. J. W. Potts; Lacon, Marshall county, Illinois; my occupation is physician.

Q. How long have you been a physician in Lacon and the vicinity?

A. For eleven years or more.

Q. Of what school of medicine are you?

A. Eclectic.

Q. How much has your practice extended up and down the river from this point and among people living on the river?

A. It has extended south to Crow Creek; that's about six miles and north, probably three or four miles.

Q. From what source does Lacon receive its water supply?

A. From the city waterworks, from wells.

Q. How far from the river?

A. Well, that I don't know, probably a thousand feet.

Q. Is there a slough or pond containing Illinois river water nearer to this well than the river?

5744 A. Well, that is a question I can hardly answer; if you call this a slough, it is nearer to the well than the river; but if it is a part of the river,it is not. I don't know where the river begins, nor where it ends, there.

Q. How deep is this well, about?

A. My recollection is that the bottom of the well from the top of the well, it is 39 feet. I was on the city council when they lowered the well; my recollection is that the pipe is 39 feet from the top of the well.

Q. Is it an open well or a driven well—a drove well?

A. It is open for twenty odd feet and then it is driven from there down; pipes.

Q. What proportion of the people of Lacon in your judgment use water from this public supply?

A. Well, fully three-fourths now, and I don't know but more; there are so many public places where they get water.

Q. Is there a sewage system in Lacon, and if so, how extensive?

A. No sewerage system.

Q. How is the domestic sewage disposed of?

A. Dumped in cess-pools, top drainage of course.

Q. Are they cleaned out by mechanical means or just allowed to drain?

A. Why, the most of them are just allowed to drain; the modern cess-pools of course are cleaned out, but they are
5745 not very numerous.

Q. Does this drainage from the cess-pools seep into the Illinois river, or is it absorbed by the earth?

A. Absorbed mostly, I should judge. Underneath is a solid bed of gravel and sand. You go down from four to fifteen feet anywhere in the city and you will strike gravel and the depth of that gravel in the well up here we sink that tube in the neighborhood of twenty feet. That was from the bottom of the well, and that was through gravel all the way down there where the well is.

Q. Has the city a health department in which mortuary statistics are recorded?

A. Not in the city, no, sir.

Q. Are the death certificates reported to the county clerk?

A. Yes, sir.

Q. Do you know of any typhoid fever in this community within the last three years, doctor?

A. No, sir.

Q. Neither among the people along the river nor back from the river?

A. No, sir, not to my personal knowledge.

CROSS-EXAMINATION, by Mr. Jeffries.

Q. You say about three-fourths of the people use the 5746 water from the public supply?

A. I think so, fully that many.

Q. From what source do the remaining people procure their water?

A. There are some public wells here and then there are cisterns.

Q. This water that you use from these wells, is filtered through the sand and gravel?

A. Yes, sir.

Q. That is the theory upon which they were built?

A. That is the theory, yes, sir; they are sunk from sixty to seventy feet, in the gravel.

Q. None of the people of Lacon and vicinity use the water of the Illinois river for domestic purposes, do they, doctor?

A. Not to my knowledge.

Q. You wouldn't recommend the water of the Illinois river for domestic purposes since the opening of the canal, would you?

A. No, sir; nor at any other time.

J. W. POTTS, M. D.

5747 Lacon, Illinois, July 24, 1903.

S. S. EVERETT, called as a witness in behalf of the defendants, being first duly sworn by the Commissioner, was examined in chief by Judge Johns and testified as follows:

Q. State your name, residence and occupation?

A. E. S. Everett; Lacon, Illinois; physician and surgeon.

Q. How long have you lived in Lacon?

A. Seven years and a half.

Q. Of what school of medicine are you?

A. Regular.

Q. Have you practiced medicine in this vicinity during that time?

A. I practiced in this vicinity for ten years and a half.

Q. Where the remaining years?

A. Across the river at Sparland.

Q. How large a community is Sparland?

A. About 450.

Q. What is its water supply?

A. Quite largely well water; they have no public supply; well water and cistern water, but largely well water over there.

Q. In what county is Sparland?

A. Marshall; same county.

5748 Q. What is the water supply of the people of Lacon?

A. We have a public water supply; the water is taken from deep wells down on the bank of the river and of course besides that, we have wells and cisterns, but our people here in Lacon use well water very little, having this public supply of water; but very largely our better citizens use a filtered suppiy of cistern water?

Q. For drinking purposes?

A. Yes, sir.

Q. Is there a system of public drainage here?

A. No, we have no sewerage system at all; we have an almost ideal natural drainage, however.

Q. Describe it ?

A. The slope—the lay of the land, and the sub-soil is sand and gravel and there is perfect drainage almost to the river; there is no strata of sub-soil to hold the water, to prevent it going downwards and draining back toward the river.

Q. The natural subterranean drainage is towards the river, is it?

A. Yes, sir.

Q. And through a gravelly sub-soil?

A. Yes, sir. The gravel formation is quite deep; you soon strike it below the shallow surface.

5749 Q. How is the household sewage disposed of?

A. Well, cess-pools.

Q. And privy vaults?

A. Privy vaults, yes.

Q. Where are your mortuary statistics recorded?

A. At our county courthouse; the town is the county seat of Marshall county.

Q. Have you known of any typhoid fever in Lacon during the last three years and a half?

MR. JEFFRIES: Objected to as leading.

A. I have.

Q. How many cases?

A. You mean that I have personally treated?

Q. Yes, that you know about?

A. I don't think I have had but four cases in three years.

Q. Where have these cases been?

A. In town.

Q. To what did you attribute them?

A. I think they were imported cases.

Q. The people having contracted the disease elsewhere?

A. Yes, one of them I remember distinctly occurred about
5750 two years ago at this time of the year. A lady from Rock
Island, Illinois. They were having a great deal of typhoid, an epidemic in that city at the time, and she came here to care for her aged mother, and was taken sick in about ten days; that was one very clear case of importation.

Q. What became of the dejecta of the typhoid patients whom you treated?

A. It was disinfected and buried as a rule.

Q. Both as to the urine and the fecal matter?

A. Yes.

Q. What is the condition in this vicinity as to malarial diseases?

A. We have quite a little malaria along the river all the way here; it is not a severe malaria; the types of malaria here are not severe; they are easily treated; it is getting less and less as my judgment serves me; the older physicians tell me about a great deal of malaria they used to have around the country. Our malaria is easily treated.

CROSS-EXAMINATION, by Mr. Jeffries.

Q. Have you any means of ascertaining or judging of the other three cases of typhoid fever that you mentioned a few minutes ago?

5751 A. Well, I think they were from the country; imported from the country. They all occurred in the same family. The first case had been in the country visiting some little time, previous to the attack. That is all I could give as to the causation. The hygienic conditions about the home were very good. They used cistern water.

Q. Was there any typhoid fever before the canal was opened prior to three years ago?

A. A little; about the same as now; I don't notice any difference about that.

Q. You say the malarial fever has been growing less and of a milder form for the last two or three years past?

A. Yes, particularly the last two or three years.

Q. And from what the older physicians have told you it is of a much milder form now than formerly?

A. Than formerly, yes, sir.

Q. Do any of the people in Lacon, or the town on the opposite side of the river which you mentioned a few moments ago, use the water of the Illinois river for domestic purposes?

A. No.

Q. Since the opening of the Chicago drainage canal, would you recommend the water for domestic purposes?

A. No; never would.

Q. These wells here in Lacon obtain their supply by
5752 filtration through sand and gravel?

A. Yes, sir.

E. S. EVERETT, M. D.

5753 Henry, Illinois, July 24, 1903.

J. A. McCUNE, called as a witness in behalf of the defendants, being first duly sworn by the Commissioner, was examined in chief by Mr. Todd and testified as follows:

Q. What is your name?

A. J. A. McCune.

Q. Where do you live?

A. City of Henry.

Q. Did you take water for the Sanitary District, the University of Chicago and the University of Illinois, in 1899 and 1900?

A. Yes, sir.

Q. Where did you take it?

A. I took it at the dam at the north end of the lock.

Q. Above what dam?

A. The dam at Henry, Illinois.

Q. How often did you take the samples.

A. Once a week.

Q. Where did you get the bottles?

A. Got them from Chicago.

Q. Did the bottles have the stoppers in them when they got here?

5754 A. Yes, sir.

Q. Describe how you got the water after you got the bottles?

A. I put the bottles in a skiff and went out to where I wanted to get the water and took the bottles and put them under water and let them fill and took them out, recorked them and sent the bottles away, sent them to Chicago.

Q. Did you rinse them out?

A. Rinsed it before I commenced to fill it.

Q. Where did you remove the cork from the bottle?

A. In the skiff before I went to fill them.

Q. Well, above or below the water?

A. Below the water; when I filled the bottles to send them away, yes, and re-corked them below the water.

Q. After you had filled the bottles how did you prepare them for shipment?

A. I sealed them, made a statement of the water and sent them to the express office and sent them away.

Q. Where did you ship them?

A. Shipped them to Chicago.

Q. Anywhere else?

A. No, sir.

Q. Did you ship any to Urbana, to Prof. Palmer?

A. Well, I did the second year, yes, sir; a bottle each week.

5755 Q. The first samples taken by you were shipped only to Chicago?

A. Went only to Chicago, yes, sir; that is my recollection; I may be mistaken, but that is my recollection.

Q. The second samples taken by you were shipped to Prof. Palmer at Urbana?

A. Yes, sir, I think so.

Q. Prof. Jordan?

A. And Prof. Jordan.

Q. To the Health Department of the City of Chicago?

A. I suppose they got them; that is, I don't know; I couldn't say; that was as far as we were directed—to Dr. Jordan.

Q. Do you pack any of the samples in ice?

A. Yes, sir.

Q. Which ones, the large or the small samples?

A. The small samples, every week.

Q. After you had prepared the samples for shipment, did you place a card on each sample similar to the card which I now show you which is sample No. 1411?

A. Yes, sir.

Q. Is that card in your handwriting?

A. Yes, sir.

Q. And that kind of cards with the proper notation were filled out by you and sent with each sample?

A. Yes ,sir.

5756 Q. Attached to the sample?

A. Yes, sir.

MR. TODD: I will ask you to have card sample No. 1411 marked Sanitary District Exhibit No. 11 for identification.

Card so marked by the Commissioner.

CROSS-EXAMINATION, by Mr. Jeffries.

Q. At what place in the river did you say you took these samples?

A. At the upper end of the wharf, at the dam.

Q. What dam?

A. The dam across the Illinois river at Henry.

Q. What do they call it?

A. They call it the dam across the Illinois river.

Q. How far above Henry is the dam?

A. Well, it is about probabaly four rods above the north line of the corporation, sir.

Q. How far above the dam did you take the samples?

A. Probably 120 feet.

Q. Did you take them out in the channel?

A. No, sir; took them out right where the water comes around the point of the lock wharf.

Q. How long after these samples were taken before they were shipped?

5757 A. Well, sir, from an hour to an hour and a half, before they were put on the train; I took them generally about time enough to get them to the express office before the express went to the train.

Q. You shipped them over the Rock Island, did you?

A. Yes, sir.

Q. Did you personally take these samples?

A. Yes, sir, every one of them.

J. A. McCUNE.

5758 Henry Illinois, July 24, 1903.

CLYDE BAUTER, called as a witness in behalf of the defendants, being first duly sworn by the Commissioner, was examined in chief by Judge Johns and testified as follows:

Q. What is your name, residence and occupation?

A. Clyde Bauter; I live here in Henry; fisherman.

Q. How long have you been a fisherman on the Illinois river?

A. I have been fishing here for the last nine years, I guess; a little longer than that.

Q. Over what territory in the Illinois river have you fished?

A. Well, I fished about three miles below Copperas Creek and clear to Spring Valley.

Q. When did you fish below Copperas Creek?

A. Well, it has been; my brother can tell you more about that; I was sick then and they was doing the fishing down there; he can tell you what time it was.

Q. Did you fish below Copperas Creek enough to become acquainted with the water down there?

A. Well, when we was fishing there the drainage wasn't in at all.

Q. What was the condition of the water down there before the drainage was turned in?

5759 A. Well, it was low; it was in the fall of the year when we were down there; it was low; it was about a three foot and a half fall on that dam down there, or three feet, and the water seemed to be all right then. I couldn't see nothing wrong with it then; it was a little scummy along the banks.

Q. Was there any slime in the nets?

A. Oh, yes, sir; there was slime in the nets; that is in the fall and winter time. They don't slime to amount to anything now.

Q. What was the appearance of this slime below Copperas Creek in the nets?

A. Why, it is a kind of a white stuff; you can't shake it off at all; you have to whip it off with a stick; it is like paste.

Q. What was the appearance of the water at this point before the opening of the drainage canal?

A. Do you mean how the water acts now?

Q. No, before the time the drainage was turned in?

A. Before the drainage was in the nets took the slime up a great deal and the water used to be green and scummy like. I don't think it was as pure as it is now by no means.

Q. What was its condition in the winter when the river was frozen over at this point?

5760 A. Well in the winter time when the water would freeze over, in low water, the water would get gassy, tarry, make the fish taste, and people couldn't eat them; there was no market for them; fish couldn't stay in the back water lakes in low water, before the drainage was in.

Q. Was there a smell under the ice in the winter?

A. Well I don't know whether it is or not; I couldn't say; I never noticed it particularly; I know the water used to get gassy and tarry; I know you couldn't eat the fish at all; that's all I know about that; I never noticed the water smelling.

Q. Have you fished any below Peoria since the opening of the drainage canal?

A. Yes, fished down there two years; I believe, and the water was just as pure as I could see; just as pure as it is now; I couldn't see any difference; only lots of current.

Q. How far below Peoria did you fish?

A. Copperas Creek.

Q. Below or above the locks?

A. Above.

Q. Was the water at Copperas Creek better or worse after the opening of the drainage canal?

A. That's pretty hard to say; I have not been down there for four years now; I couldn't say it was better or worse; but when I was down there the water used to be scummy just like it is up here—scummy and dirty.

5761 Q. I think you misunderstood me. Did you actually fish below Peoria after the drainage canal was turned into the Illinois river, three years ago?

A. Yes sir, I fished down there—the first year it was turned in we fished in Spring Lake, right there above the Copperas Creek, Spring lake and the river. This makes the second year here; and it was only in three years.

Q. What was the condition of the water in the river below Peoria, in the year 1900, three years ago this summer?

A. Well, I couldn't see anything wrong with it then myself; I fished there; I couldn't see nothing wrong. I know there was plenty of current there, that is all.

Q. Now, since the opening of the drainage canal, and at this point, what has been the condition of the water?

A. Well since the drainage canal was opened the first year, the water wasn't as good as it is now; the fish lives good and everything; we wouldn't ask for any better water at all, and the boilers on the boats don't foam or nothing. Four years ago before the drainage was in we was up fishing up above here and we couldn't keep steam on the boiler for foaming water; she would foam over.

Q. How long have you run a boat, operated by steam on the Illinois river?

A. Five years this July 1st.

5762 Q. Did you run a boat operated by steam below Peoria and before the drainage canal was opened?

A. Yes sir.

Q. How did the water act then in the boilers?

A. Just the same; foamed over in the summer time; not in the fall. After the water got cold it wasn't so bad.

Q. Did you run a boat operated by steam below Peoria after the drainage canal was opened?

A. Yes sir; one year, that's all.

Q. How did the water act in the boilers then?

A. Well the first year, if I ain't mistaken, she foamed a little bit, but she don't foam any more.

Q. Since the opening of the drainage canal, have you run a boat in this vicinity operated by steam?

A. Yes sir, run it from Peoria to Spring Valley, as far as we fished.

Q. How does the water act in the boilers now above Peoria?

A. All right; no complaint at all; for the last two years there ain't been no foaming done in the boilers at all.

Q. Are you pretty well acquainted with the fishermen between here and Copperas Creek?

A. Very near all of them I guess. The biggest majority of them I guess.

Q. Do you know of any typhoid fever among them in the last three years?

5763 MR. JEFFRIES: Objected to as leading.

A. No, I don't; I couldn't say nothing about that. Of course I don't think there is anybody that I know of amongst the fishermen that had the typhoid fever in the last three years. I know by golly, I ain't had the chills for a long while.

CROSS-EXAMINATION,
By Mr. Jeffries.

Q. How long did you say you had been fishing?

A. Nine years or more, nine years anyway.

Q. Up here at Henry all the time?

A. No, three years at Henry.

Q. Where were you before you commenced fishing here?

A. Peoria.

Q. Do you live in a dwelling or a house-boat?

A. Dwelling.

Q. Have you a cistern at your house or a well?

A. Two.

Q. Two cisterns?

A. Yes sir.

Q. Do you get your drinking water and water for domestic purposes out of a well?

A. No we use out of the cistern for the house.

Q. Where do the people of Henry get their water supply?

A. Well that's according to what water supply you mean.

5764 Q. Well where do they get the water that they use in their homes?

A. They got them out of cisterns until they got their waterworks.

Q. When did they put up their water system here at Henry?

A. Well they put it up last year; last fall was the first water they used from it.

Q. Explain that water plant; describe it.

A. The building?

Q. No, the whole business?

A. Well it is nothing but a lot of pipes laid in the ground.

Q. Where do they get their water?

A. From a well.

Q. What well?

A. They have got a dug well and two drove-wells, and they get it from a pipe laid in the ground, pumped by a gasoline engine, or a gasoline pump.

Q. How deep are those wells driven?

A. Well I couldn't say; I never heard nor never paid any attention to it.

Q. Where did the people get their water before this water plant was constructed?

A. They got it from the cisterns; the cisterns on the place where they lived; their residence, and they got it from the artificial well here in the park.

5765 Q. They did not use the water, and do not use the water from the Illinois river in their homes?

A. No, not as I know of; I don't believe that they do.

Q. You say you did no fishing below Peoria prior to the opening of the canal?

A. Not only the first year.

Q. And the water in the Illinois river below Peoria, the first year after the opening of the canal was very much worse?

A. Well, it didn't look as good as it does now, the first year.

Q. And it did not look as good as it did before the canal was opened?

A. No.

Q. Were you acquainted with the water above Peoria and along this point, Henry before the Chicago drainage canal was opened?

A. Yes. The water in the summer time was poor; it was awful green, and it wasn't good at all; it stunk.

Q. Now the first year after the opening of the canal, the water at this point and all along the river so far as your knowledge goes, was not so good as it was before the canal was opened?

A. The water when it was low, it wasn't as good as it is now for the last two years.

Q. And was not quite so good as it was before the canal was opened?

5766 A. No; that's right too.

Q. Now, what was the condition of the channel or current of the river from below Peoria to the Henry dam, before the canal was opened?

A. Oh yes, there was plenty of it.

Q. What was the condition of the current?

A. It was pretty swift.

Q. How is it since the canal was opened?

A. Well sir, it is swift.

Q. Very rapid, isn't it?

A. Yes sir, it carries a pretty good stream, about four miles an hour.

Q. You say there was a green scum formed on the water before the canal was opened?

A. Before the drainage was opened, it come up in the summer time, green.

Q. That scum was of a vegetable character, wasn't it?

A. Yes, as near as a fellow could get at it.

Q. There is a considerable scum yet, isn't there?

A. Not in the middle of the river, it isn't; there is on the banks. Of course when the river is falling it is then, but it don't carry clear across.

Q. The water in the Illinois river at this point is not very clear now, is it?

5767 A. Well, I can't see anything wrong with it now; it is a little muddy; it will get muddy any time, I think the rains is what makes it muddy; I don't think the drainage makes it muddy at all.

Q. Now in the winter time and late in the fall, slime forms on the nets yet, doesn't it?

A. Yes it does, but it ain't the same stuff.

Q. Does it form on the nets here at Henry?

A. It does.

Q. How much and what is its character?

A. Well it is a kind of a rotten stuff; it don't hang on like the other did; the other stuff was a kind of a glue.

CLYDE BAUTER.

5768 Henry, Illinois, July 24, 1903.

B. F. FORREST,

called as a witness in behalf of the defendants, being first duly sworn by the Commissioner, was examined in chief by Judge Johns and testified as follows:

Q. What is your name, residence and occupation?

A. My name is B. F. Forrest; my occupation is physician and surgeon. Residence Henry, Illinois.

Q. How long have you been a physician?

A. Twenty years.

Q. Of what school of medicine are you?

A. The regular school.

Q. How long have you practiced medicine in Henry and vicinity?

A. About thirteen years.

Q. How much of distance above and below Henry have you practiced in the vicinity of the Illinois river.

A. My practice extends in a general way as far north as

Hennepin; I get in Hennepin once in a while, and as far south as Lacon.

Q. If you have occupied any official position in the city of Lacon, you may state when and what position?

A. I occupied the position as Mayor, from 1892 to 1894,
5769 I think it was, or 1895, and from 1898 to 1900, two terms;
I think those are the dates, or near them.

Q. Where does the city of Henry obtain its water supply?

A. Until the present time it has been from cisterns and wells that is in the past, until within the period of the last three months, they have added a city waterworks from which a portion of the people are using. It has been principally from cisterns.

Q. From what source is the water works supplied?

A. From wells—bored wells.

Q. Have you any system of public sewers?

A. No sir.

Q. What becomes of the household sewage?

A. As a rule it is thrown out; some people haul it away in barrels, but the most of it is thrown on the top of the ground, in back yards and alleys, a large portion of it, and privies.

Q. Are there cess-pools here?

A. No sir.

Q. How big is the population?

A. About seventeen hundred.

Q. Do you know of any cases of typhoid fever in this vicinity within the last three years?

A. Yes.

5770 Q. How many and where?

A. I think there are two at the present time that I am attending.

Q. Are they in the city or in the country?

A. In the city.

Q. To what do you attribute these cases?

A. I don't know, other than one of the patients has been away from home, visiting in Indiana, and was taken down with this malady at once after returning, and has had it for three weeks.

Q. Can you account for the other at all?

A. No sir; I inquired particularly as to any source of infection and have learned that they have been using cistern water only and I know of no other method, or no other condition from which she might have been infected.

Q. In the past three years since the opening of the drainage canal, what has been the number of deaths, if any from typhoid fever?

A. None.

Q. What is done with the dejecta of the people, of urinary and fecal matter, of these two typhoid fever cases?

A. They were disinfected and emptied into the vault.

Q. What do you use for a disinfectant?

A. Well I use carbolic acid and lime.

5771 Q. Have you hunted and fished much upon the Illinois river since your residence in Henry?

A. Yes sir, a great deal.

Q. In what way do you fish?

A. I fish with a pole and line and have also been connected with a seining outfit in this way, backing it, knowing what they were doing.

Q. What was the condition of the Illinois river at this point before the opening of the drainage canal?

A. In times of high water, it was good; that is the condition of the water was good, fairly good. In conditions of low water the water was very bad, polluted.

Q. What was its condition when the river was frozen in the winter?

A. After the river would become frozen over, there was a break in the column of ice at the dam; at times the gases that would arise from that break in the dam where it didn't freeze over, it would become very bad; at times so much so that it was very offensive.

Q. What was the effect on the fish?

A. The effect was to kill the fish; if the river remained coated with ice for two or three weeks without a break up, a large number of fish would die.

5772 Q. Were the fish tainted?

A. Yes sir, unfit for food.

Q. Since the opening of the drainage canal, what has been the condition of the water at this point?

A. The water apparently has been better; there has been an absence of this stench, I haven't noticed it as much, not near as much.

Q. As to the fish what would you say?

A. I have heard no complaint; I have known the fishermen have taken them all this season and used them for food.

Q. How far from here to Lockport by river?

A. I don't know.

Q. How far to La Salle?

A. About thirty miles I think.

Q. How far to Peoria?

A. Thirty-three miles.

CROSS-EXAMINATION,

By Mr. Jeffries.

Q. This water system has only been put in about a year, hasn't it?

A. No sir, it hasn't only been in operation three months.

Q. What was the character of the water supply before this system was constructed?

5773 A. Why from cisterns and wells.

Q. The water from the river was not used?

A. Not used, except in ice.

Q. The ice is cut from some of the bays?

A. The ice is cut from the river, or the little ponds supplied from the river, back from the river.

Q. Were there any cases of typhoid fever here before the canal was opened?

A. Yes sir.

Q. There was no epidemic or anything of that kind?

A. There never has been. There hasn't been twenty cases of typhoid fever in thirteen years, all told, since I have been river for domestic purposes?

Q. You wouldn't recommend the water of the Illinois river for domestic purposes?

A. No sir.

Q. How is the character of the channel or flow of the river now as compared to what it was before the canal was opened?

A. More current; at times before the drainage canal was put in there was no current, or almost none.

Q. That was when the water became bad?

A. No, not at all times but when it was low it was ordinarily worse; very low; it became stagnant.

B. F. FORREST.

5774 Henry, Illinois, July 24, 1903.

WILL SIEWERS,

called as a witness in behalf of the defendants, being first duly sworn by the Commissioner, was examined in chief by Judge Johns, and testified as follows:

Q. What is your name, residence and occupation?

A. Will Siewers; Henry, Illinois; grocery clerk.

Q. Did you take samples of water here for the State of Illinois?

A. Yes sir.

Q. Do you know who was originally employed here to do that?

A. Why, Mr. Gregory was I guess; but I was working for him.

Q. Did you take the samples of water according to the instructions that were given you?

A. Yes sir.

Q. At what point in the river did you take them?

A. I should judge it was about four or five hundred yards above the dam.

Q. Did you place cards giving the date of the collection, and the temperature of the water and air in an envelope similar to the one I now hand you marked "Geo. A. Wiggins, M. D., Milan, Ill." and on which is written in lead pencil "J. 5775 H. L."?

A. Yes sir, similar to that.

Q. Were you authorized by Mr. Gregory to write his name upon the cards which you made?

A. Yes sir.

Q. I hand you 32 cards and ask you to examine them and state whether those are the cards which you made and placed in the envelopes?

A. All there except those two; those two are not my writing; but that is Mr. Gregory's writing and that is his son's (referring to the two cards).

Q. The card dated June 19, 1900, numbered 424 is in the handwriting of Mr. Gregory?

A. Yes sir.

Q. The card dated December 4th, 1899, is in the handwriting of Mr. Gregory's son?

A. Yes sir.

Q. How often did you take these samples of water?

A. Why, every two weeks I believe.

JUDGE JOHNS: I now hand to the Commissioner the 32 cards referred to and ask that they be marked Exhibit 10, for the State of Illinois, to the witness Will Siewer's testimony, for identification.

Said cards are so marked by the Commissioner.

5776 Q. After the water was taken and sealed and tagged, how long before it was shipped by express?

A. Why it was about an hour before it left here; I would generally take it about 8:30 and the train would leave at 9:30.

Q. Did you each time take two samples, one in a large bottle and one in a small bottle?

A. Yes sir.

CROSS-EXAMINATION,

By Mr. Jeffries.

Q. Did you take all of this water personally?

A. Yes sir, took it all personally.

Q. No one took any of it for you?

A. Not that I know of.

Q. How deep under the surface of the water did you go?

A. About a foot.

Q. Did you use some kind of an instrument, or your hand?

A. My hand.

Q. What time of day would you generally take them?

A. About 8:30 A. M.

Q. And when would they be shipped?

A. About 9:30.

Q. Except when you failed to get back in time to ship it that day?

5777 A. Well I don't remember of any time that we missed.

WILL SIEWERS.

JUDGE JOHNS: I now offer in evidence the envelope referred to in the examination of the water takers on the Illinois river in behalf of the State of Illinois, marked as indicated in the testimony and ask that it be marked Exhibit No. 11 for the State of Illinois, for identification.

Said card is so marked by the Commissioner.

5778 Henry, Illinois, July 24, 1903.

ELMER MELICK,

called as a witness in behalf of the defendants, being first duly sworn by the Commissioner, was examined in chief by Judge Johns and testified as follows:

Q. What is your name, residence and occupation?

A. Elmer Melick; Lock tender at the Henry Lock. Henry, Illinois.

Q. How long have you been lock tender at Henry Lock?

A. Since October 1st, 1900.

Q. What was your occupation before that?

A. Three seasons I was with Capt. York on the steamer Peoria; five or six years I was in a grocery store at Henry, here. And I was east about one year.

Q. Upon what portion of the river did the steamer run?

A. From Henry to Peoria and return.

Q. How long then, have you been acquainted with the water of the Illinois river between Henry and Peoria, and at Henry?

A. When I was on the boat I didn't pay much attention to the water; that is any more, we just ran up and down the river, and if it was high or low water we would notice it. Since I have went to work on the locks up here I have noticed 5779 the water more or less.

Q. You did not go to work on the lock until after the opening of the drainage canal?

A. I believe not.

Q. How far from Henry Lock to Lockport, by way of the river?

A. I don't know the exact distance, but I looked at the sheet; we have a tollage sheet and a mileage sheet.

Q. How far from Henry lock to Copperas Creek dam?

A. I think it is 65 miles.

Q. Is Henry a state or a government dam?

A. State dam.

Q. Now what has been the condition of the water in the Illinois river since you have been attending the locks?

A. The water has been lots better than it was before.

Q. In what respect?

A. Before it used to be a bad odor arise from it and since I went to work over there I haven't noticed this odor.

Q. Is the river at this point and on this day lower than the average, or higher?

A. It is higher.

Q. What is the stage of the river here now, today?

A. The lower gauge is 8.9; the upper gauge that gives the water on the dam is 2.4.

Q. Are both these gauges placed on a mitre sill for zero?

5780 A. They are zero I believe.

Q. Is the zero of both gauges upon the same level?

A. No sir, I think not. The upper gauge is just the water as it goes over the dam.

Q. What is the purpose of the upper gauge?

A. To tell the depth of the water that is going over the dam.

Q. So that the gauge shows that there are two feet and four-tenths?

A. Yes sir.

Q. On the crest of the dam now?

A. Yes sir.

Q. Do you know when the flash-boards were taken off this dam?

A. No sir, I couldn't tell.

Q. Were they taken off before you came here as lock tender?

A. Yes sir.

Q. Since you have been here what has been extreme low water mark on the lower gauge?

A. I couldn't give you the exact figures without looking at the gauge book; we have a gauge book at the office.

Q. What is your best recollection about it?

A. Oh, I couldn't say for sure; I think about six feet.

5781 CROSS-EXAMINATION,

By Mr. Jeffries.

Q. How long is the dam across the river?

A. 540 feet I think.

Q. You say the water is now 2.4 deep on top of the dam?

A. Yes sir.

Q. Flowing over the dam?

A. Yes sir.

Q. Is that an ordinary stage or rather low?

A. Well at this time of year; in years gone by, we ought to have about 1.2 on the dam.

Q. Well that was before the canal was opened?

A. Yes sir; when I first went to work in October it was only one foot and two-tenths on the dam, in 1900.

Q. The flash-boards were not used then?

A. No sir.

Q. And have not been used since you have been there?

A. No sir.

Q. You say you don't know anything about the condition of the water before the canal was opened?

A. Not a great deal, no; only the smell and odor.

Q. Where were you working then?

A. In Henry. Part of the time.

5782 Q. What was the condition of the current before the canal was opened?

A. I couldn't say.

Q. What is its condition now, pretty swift?

A. Very swift; the fishermen are all kicking about it, is all I know; they say they can't seine.

Q. Do you notice a green, oily substance forming in the lock now, occasionally?

A. Yes sir, occasionally; very little though.

ELMER MELICK.

5783 WILLIAM McKINLEY,

re-called. Direct-examination continued by Judge Johns.

Q. What was the condition of the water in the Illinois river before the opening of the drainage canal, from Kampsville to the mouth?

A. In dead low water, it was very bad.

Q. In what respect?

A. Well it was stagnant; weeds grew in it; I have seen the weeds grow out from each bank, right to the channel—and moss.

Q. How was it for steam purposes?

A. Well I couldn't tell very much about that because I wasn't in there long enough.

Q. Were you not much below Kampsville dam prior to the opening of the drainage canal on State fish-boats?

A. No sir, not very much.

Q. How was the water after the opening of the drainage canal, below Kampsville locks?

A. Well, it has improved.

Q. In what respect?

A. Well there is more water and running water, and there isn't any moss or any vegetation of any kind.

Q. Since the opening of the drainage canal, have you been below Kampsville upon the State fish-boats?

5784 A. Yes sir.

Q. How has the water been for steaming purposes?

A. It has been all right.

Q. Before the opening of the drainage canal, what was the condition of the water in the Illinois river between Kampsville dam and La Grange dam?

A. Well it was about the same as it was below; there wasn't so much vegetation on account of the dam held the water up; made the water deeper here.

Q. Did the Kampsville dam back water up as far as La Grange dam?

A. Well I heard them say at Meredosia that it raised the water there four inches; or at the lock; that's only what I heard; I don't know anything about that.

MR. JEFFRIES: I move that the answer be stricken out because it is based on hearsay testimony and is therefore not the best evidence.

Q. JUDGE JOHNS: How far is Kampsville dam below La Grange dam by river?

A. Forty-six miles I believe.

Q. Before the opening of the drainage canal, what was the condition of the Illinois river between La Grange dam and Copperas Creek dam?

A. Well it was a kind of a pond like; not much current; stagnant.

5785 Q. How was it for steaming purposes?

A. Well about the same as it always was; we would have to clean the boilers every eight days, we calculated on.

Q. After the opening of the drainage canal, what was the condition of the Illinois river between La Grange and Kampsville dam?

A. It was improved to what it was before.

Q. How was it for steaming purposes?

MR. JEFFRIES: Objected to as leading and suggestive.

A. In what way do you mean?

Q. Between La Grange and Kampsville?

A. For steaming purposes, about the same as river water; you couldn't notice much difference; we had to clean boilers every so often anyway.

Q. After the opening of the drainage canal were the boilers dirtier or cleaner than before the opening of the drainage canal?

A. Well, the water was cleaner than it was before; at least we don't get as much out of the boilers.

Q. Is the water between La Grange and Kampsville dam, since the opening of the drainage canal, better or worse than the water below Kampsville dam?

MR. JEFFRIES: Objected to as leading.

A. About the same.

5786 Q. How far is it from La Grange up the river to Copperas Creek dam?

A. About 83 miles.

Q. How far is the influence of La Grange dam felt up the river?

A. Well I don't know, but it is felt at Havana, about six inches there.

Q. Before the opening of the drainage canal what was the condition of the water between Copperas Creek and La Grange?

A. Well the water was low, you know, and there wasn't much current; it was stagnant the same as it was below.

Q. How was it for steaming purposes?

A. All right; that is, you couldn't tell any difference in it; as I said before we clean the boilers every so often anyhow.

Q. After the opening of the drainage canal what was the condition of the waters between La Grange and Copperas Creek?

A. Why it was improved, about the same as it was below.

Q. When you cleaned out the boilers, how did the mud compare with the time before the opening of the drainage canal?

A. Well, we had more real mud I think, before.

Q. How was it as to lime and scale?

A. Well as to lime and scale; I don't think it made any difference.

5787 Q. After the opening of the drainage canal, how was the water for steaming purposes, between Copperas Creek and La Grange?

A. It was all right.

Q. After the opening of the drainage canal how did the water between Copperas Creek and La Grange compare with the water between La Grange and Kampsville; was it better or worse?

A. Well the water up the river, the farther up you got, I think it is worse, until you get to Peoria.

Q. Before the opening of the drainage canal, what was the condition of the water from Pekin down to Copperas Creek dam?

A. Well it was pretty rank, pretty bad.

Q. What was the condition of the water from Pekin to Peoria?

A. Well it kept getting worse; that is in low water.

Q. In what respect was it bad from Pekin down and from Peoria to Pekin?

A. Well, there was more sediment in the water and it was more difficult to get an injector to work between Pekin and Peoria than it was below there.

Q. After the opening of the drainage canal, what was the condition of the water between Copperas Creek dam and Pekin?

A. Well, it was improved; there was more water.

Q. How was it for steaming purposes?

A. Well it was all right so far as steaming purposes were concerned; if you let the boilers get dirty or run them over, they would prime, it didn't make any difference where it was.

5788 Q. After the opening of the drainage canal what was the condition of the water between Peoria and Pekin?

A. Why, it was improved about the same as it was at the other places.

Q. Was it and is it still bad, between Pekin and Peoria?

A. Well, since then we haven't had any right dead low water.

Q. How does the water in the Illinois river since the opening of the drainage canal, below Pekin, and to Copperas Creek dam, compare with the water below Copperas Creek dam and to La Grange; is it better or worse?

A. It is better below.

Q. Prior to the opening of the drainage canal, what was the condition of the water in the Illinois river from Peoria to Chillicothe?

A. The water was all right, good.

Q. After the opening of the drainage canal what was the condition of the water from Peoria to Chillicothe?

A. Well it was still good.

Q. How did it compare with the water as to condition before the opening of the canal?

A. Well you couldn't tell very much difference in it here.

Q. Before the opening of the drainage canal, what was the condition of the water and the current between Chillicothe and Henry dam?

A. Well the water was all right, but there wasn't much
5789 current; it was kind of a stagnant place; the water wasn't
bad though; every now and then there would be a green
scum on it in low water or warm weather.

Q. Before the opening of the drainage canal, how did the water from Henry to Chillicothe compare with the water from Chillicothe to Peoria?

A. About the same.

Q. After the opening of the drainage canal, how did the water from Chillicothe to Henry compare with the water from Chillicothe to Peoria?

A. Well it was about the same.

Q. How was it for steaming purposes?

A. I couldn't notice any difference.

Q. How far is it from Peoria to Chillicothe?

A. Eighteen miles I believe.

Q. How far from Chillicothe to Henry?

A. Twenty-two miles.

Q. How far above Henry have you been upon the Illinois river on the State boats?

A. Thirty miles to La Salle.

Q. Were you on that stretch of river both before and after the opening of the drainage canal?

A. Yes sir.

5790 Q. What was the condition of the water from Henry to La Salle before the opening of the drainage canal?

A. Kind of stagnant, slow current, same as it was between here and Peoria.

Q. What has been the condition of the water between Henry and La Salle since the opening of the drainage canal?

A. Well there has been more water; it is improved.

Q. How does the water from Henry to La Salle, before the opening of the drainage canal compare with the water from Chillicothe to Peoria before the opening, better or worse?

A. About the same; I couldn't tell any difference.

Q. For steaming purposes?

A. Yes, we could go from Peoria to St. Louis and not notice any difference.

Q. Is that because you kept your boilers clean?

A. Well, we didn't never allow them to go overtime or get too much in them, because there is danger of dropping sheets and burning the boiler, you know. We always look out for that.

Q. Since the opening of the drainage canal, what has been the condition of the water between Henry and La Salle?

A. It has been just about the same as between here and Peoria.

Q. Well is it better or worse than before the drainage canal was opened?

A. Why it was better; it keeps the boat farther away 5791 from the bottom; it don't stir up as much mud all the way along here, and we don't pump it into the boilers. The more water you have for a boat, it don't stir up the sediment so they get it.

Q. Since the opening of the drainage canal below Peoria and down to Copperas Creek dam, have you cleaned your boilers at any time?

A. I have cleaned the boilers at Peoria several times, yes sir.

Q. After coming up the river?

A. Yes, we would go up the river and down the river; may be cover that part of the river two or three times, and on this part of the river too.

Q. Is there any smell in the water since the opening of the drainage canal below Peoria, down to Pekin as shown by the steam and the cleaning of the boilers?

A. Well, none to speak of.

CROSS-EXAMINATION,

By Mr. Jeffries.

Q. Mr. McKinley, were you born and raised in Havana?

A. I was raised there pretty much; I wasn't born there.

Q. Describe as best you can the current of the river now as compared with what it was before the canal was opened, at ordinary stages of the water?

A. Well the current has increased.

5792 Q. Very much so?

A. Oh yes sir, you can notice that too; there is more water and it travels faster.

Q. At times before the canal was opened, there was no current, scarcely at all?

A. In places, not any; in wide water there was scarcely any.

Q. The channel is much better now than it was?

A. Yes sir, that is there is much more water and deeper water.

Q. The odor that you spoke of as coming from the water before the canal was opened, was from decayed vegetation, wasn't it?

A. Yes, mostly. In dead low water the boat would go along the river and I have just seen the boat clear up the mud for several miles, four or five miles, stir up the mud itself, and of course you have got to keep taking water all the time, and you take that in to a certain extent, you just get lots of mud.

Q. There isn't a great deal of navigation on the river is there?

A. Well there is more for the last two years or three years than there has been for five years before.

Q. You notice some since the canal was opened, don't you?

5793 A. A little bit; not very much. As far as the boilers are concerned, that is a poor thing to go by. Because sometimes we would clean our boilers, may be at Peoria; may be the next time at the mouth of the river; may be the next time at Peru or La Salle; you can't tell anything about the boiler; sometimes we clean out here and go to Quincy, and clean out there in the Mississippi river.

Q. There is more or less odor to all steam, isn't there?

A. Yes sir, after the boilers begin to get dirty.

Q. This green scum that you saw on the river before the canal was opened, and vegetation that grew out almost to the channel, grows now in places, doesn't it?

A. No, I haven't seen any since.

Q. Do you know whether it grows out in the shallows now, or haven't you been out there?

A. No, I haven't been out there in the bottoms; where it gets dry, the vegetation grows just the same as it does out in a field and in the fall it dies and decays.

Q. Does the water ever foam in your boilers?

A. If you run them too long it will; you can notice it when the whistle blows.

Q. And when the water foams in the boilers, it is because the boilers are dirty?

A. Yes sir, because they get very dirty and if we don't

5794 have a chance to clean out, we blow them out; blow the mud off of them and keep it down that way until we get a chance to clean them out.

Q. In that particular there has been very little difference between the water now and what it was before the canal was opened?

A. Not very much. As far as for boiler purposes are concerned, you can't notice very much difference.

Q. So far as your observation goes, it is only better for navigation purposes?

A. Well the water looks better and has a better appearance all the time, so far as that is concerned.

Q. You don't know what is in it?

A. No, sir; I don't know anything about that.

Q. You don't drink it?

A. No, sir.

Q. Why don't you drink it?

A. Because I can get better water for one thing, and another thing, I don't think anyone ought to drink it, because I don't think it is clean enough to drink; I don't think any of it is, especially when you can get other waters.

Q. Especially Illinois river water?

A. Yes, sir. I have drank the Illinois river water and do yet in the spring when I am out hunting and can't get any better. 5795

Q. You are working for the Illinois River Fish Commission?

A. Yes, sir.

Q. As engineer on their steamer "Illinois?"

A. Yes, sir.

WM. V. McKINLEY.

5796 Henry, Illinois, July 24, 1903.

A. G. HUMPHREY, called as a witness in behalf of the defendants, being first duly sworn by the Commissioner, was examined in chief by Judge Johns and testified as follows:

Q. What is your name, residence and occupation?

A. A. G. Humphrey; Henry, Illinois; grain business.

Q. How long have you lived at Henry?

A. A little over twenty-one years.

Q. Have you fished and hunted upon the Illinois river in this vicinity during that time?

A. Every season, yes, sir; spring and fall.

Q. What was the condition of the Illinois river at this point before the opening of the drainage canal in January, 1900?

A. Why, the condition of the water was very bad, I considered it up to the time the drainage was turned in.

Q. In what respect?

A. It had a greasy scum on the surface of it and it smelled like coal tar, and in low water that was very bad.

Q. Did it have a vegetable growth in it before the opening of the drainage canal? 5797

A. Why, yes, sir; in low water in the summer time I have seen the water just covered with it.

Q. What was the condition of the water in the winter when the water was frozen over?

A. Why, after the river had been frozen over for a while we could notice a very strong odor of gas, or tarry; the wind would blow it towards town; you could smell it all the time in the winter.

Q. Since the opening of the drainage canal, what has been its condition?

A. I haven't noticed anything of the kind since; the water seems to be a good deal purer; and not that green stuff on the surface.

Q. How about the odor in the winter?

A. I haven't noticed any since.

CROSS-EXAMINATION, by Mr. Jeffries.

Q. Have you been out on the river a great deal?

A. Yes, I hunt and fish a great deal.

5798 Q. What is the difference between the current in the river now and what it was before the canal was opened?

A. I consider there is more current in low water now than there was before.

Q. Very much more, isn't there?

A. Yes, I think there is a great deal more in low water.

Q. This green scum that formed on the water was a vegetable formation, was it not?

A. There was two different kinds; there was a vegetable matter we called duck seed, but the other scum was a greasy substance that would be on the surface of the water when the water was calm; of course it would be there just the same I suppose, but we wouldn't notice it when the water was rough.

Q. There is some scum on the water now, isn't there?

A. I have never noticed any of that greasy substance on the water; I haven't noticed any.

Q. You don't drink the water from the Illinois river?

A. No, we have a well.

Q. You don't use it at your house?

A. No, never did.

Q. It is not considered good water?

A. No, it wouldn't be considered good water for domestic use.

Q. The people of this town have wells and use the water from the city supply?

5799 A. Yes, and they have cisterns mostly, too.

A. G. HUMPHREY.

5800 Henry, Illinois, July 24, 1903.

W. T. LAW, called as a witness in behalf of the defendants, being first duly sworn by the Commissioner, was examined in chief by Judge Johns and testified as follows:

Q. What is your name, residence and occupation?

A. W. T. Law; Henry, Illinois; I am a banker in business here.

Q. How long have you resided in Henry?

A. Forty-four years.

Q. Is your bank a national or state bank?

A. National bank.

Q. What, in a general way, was the condition of the Illinois river here before the opening of the drainage canal in January, 1900?

A. Well, I don't consider it was in as good condition as it is today; the water wasn't very good; there was a smell about it in the summer time in the evening, and I don't notice that much now.

Q. Did you notice a smell about it in the winter when the river was frozen over?

A. No, I never noticed that; I never was on the river much in the winter.

Q. Was there a scum on the water here in the summer before the opening of the drainage canal?
5801

A. Usually a green scum.

Q. Did it have the appearance of being a greasy or oily scum?

MR. JEFFRIES: Objected to as leading.

A. Well, sir, I never noticed it particularly; only sometimes I would cross the river on the bridge and notice it; I never came down to the river except crossing or something of that kind the whole year round, unless to take a boat or something of that kind; I don't know very much about it from a close inspection of it at all. Just as to the general appearance of the river.

Q. And from that general appearance do you conclude that it is better or worse than before the opening of the drainage canal?

A. I judge it is better.

CROSS-EXAMINATION, by Mr. Jeffries.

Q. You say you are not on the river much?

A. No.

Q. And were not before the opening of the canal?

A. No, sir.

5802 Q. The people here in Henry have a water system, have they not?

A. Just put in one this season.

Q. And prior to that water plant they used water from driven wells and open wells?

A. And cisterns.

Q. They don't use the water from the river?

A. Not to any extent.

Q. When you say the water is better now than it was before the opening of the canal, you have no means of ascertaining that except your casual observation of it?

A. Yes, sir; there is more current in the river and the water seems to be clearer.

Q. You have made no examination of it, nor had none made?

A. No, sir.

W. T. LAW.

5803 Henry, Illinois, July 24, 1903.

FRED. BAUTER, called as a witness in behalf of the defendants, being first duly sworn by the Commissioner, was examined in chief by Judge Johns and testified as follows:

Q. What is your name, residence and occupation?

A. My name is Fred. Bauter; Henry, Ill.; fisherman.

Q. How long have you been a fisherman upon the Illinois river?

A. Between nine and ten years.

Q. Over how much of the river have you fished?

A. We fished from Copperas Creek dam to Marquette.

Q. When did you fish below Peoria?

A. Why, we fished below Peoria; we come up there four years ago; fished off and on nine or ten years ago down below Peoria.

Q. Do you run a steam tug or boat in your fishing on the river?

A. Yes, sir.

Q. What was the condition of the Illinois river before the opening of the drainage canal below Peoria to Copperas Creek?

A. Why, I don't understand what you mean.

Q. As to the condition of the substances in the water, the color of the water, the current?

5804 A. Why, before—you see I haven't been down there to amount to anything since the opening of the canal, but one fall;—before the opening of the canal the water down there, take it along in the winter time and when the water began to get cold, the water was so dirty and slimy that you couldn't set the nets. The slime stuck on the nets in big chunks, it was a white slimy stuff, sticky.

Q. Did you fish down there with a seine?

A. Yes, sir.

Q. What was your experience with reference to the fish living in the water after they had been caught in the seine?

A. Why, they woudln't live at all; I would catch them and would have to throw them out of the nets; and lots of times they would die right in the nets; I wouldn't have them out there fifteen minutes until they were dead.

Q. How did the water operate in the boilers of your steamboat?

A. In the summer time, in hot weather, it used to get so as you would have to clean out the boilers three or four times a week or put coal oil in it to keep the foam down; it foamed all the time.

Q. What was the condition of the water at Peoria?

A. Why, it was just the same at Peoria as down below. You mean above Peoria?

5805 Q. At Peoria?

A. It was not so bad; you didn't get no slime above Peoria.

Q. Above Peoria?

A. Yes, sir; you could fish most any time of the year up here and you never got no slime.

Q. How did the water act in the boilers above Peoria after the opening of the drainage canal?

A. We never had no trouble at all.

Q. What was the condition of the water in the Illinois river above Peoria and before the opening of the drainage canal?

A. Why, in the summer time it was awful green; especially along at Peoria, and a boat would stop along the bank; it would collect up and stink; you would have to get out and push it away or turn the boat around to let it pass; there was no current to let it pass.

Q. What was the condition at this point, Henry, before the opening of the drainage canal?

A. It was about the same as it was below; that is, down about Peoria.

Q. How was it in the winter when the river was frozen over, above Peoria and up to this point?

A. Why, the water in the winter time, when it used to freeze over, the water would get bad and kill the fish off, and the water and fish both would smell tarry, and taste tarry. 5806

Q. Since the opening of the drainage canal, what has been the condition of the water above Peoria and up to this point —Henry?

A. The water is more pure, I think, keeps cooler, and the fish keep a good deal better, and there is no time in the winter that you can't drink it.

Q. Is there a smell in the water since the opening of the drainage canal, in the winter?

MR. JEFFRIES: Objected to as leading.

A. Why, I never noticed any.

Q. Are you pretty well acquainted with the fishermen along the Illinois river where you fished?

A. Yes, sir.

Q. Since the opening of the drainage canal have you known of any typhoid fever among them?

A. I have not.

CROSS-EXAMINATION, by Mr. Jeffries.

Q. You say you never fished up here before the canal was opened?

A. Yes I have, too; that was the summer we run up with the tug; we run to Marquette, and the water was so bad we
5807 had to come back, and the water would foam in the boilers terribly.

Q. The water before the opening of the canal was scarcely without a current?

A. There was no current to amount to anything, no.

Q. How has it been since the opening of the canal?

A. Well, I should judge it was about two miles and a half an hour.

Q. This scum that formed on the water before the opening of the canal was of a vegetable character, was it not?

A. No, I think it was not; I think it was filth; that is how it looked to me; there was a green scum that was from the duckseed, but this wasn't.

Q. Does that filth form on the water now?

A. I haven't noticed any; may be once in a while you will see a little piece.

Q. Where has it gone to?

A. I don't know.

Q. Up the river?

A. I think it is all stopped up.

Q. It is still in the water?

A. It must be.

FRED BAUTER.

5808 Henry, Illinois, July 24, 1903.

H. HALL, called as a witness in behalf of the defendants, being first duly sworn by the Commissioner, was examined in chief by Judge Johns, and testified as follows:

Q. What is your name, residence and occupation?

A. H. Hall; Henry, Illinois; iceman.

Q. How long have you been engaged in putting up ice at this point?

A. Well, this makes me nine seasons.

Q. What was the condition of the ice here before the opening of the drainage canal?

A. Why, it seemed—a good many sediments in it; and some of it would be clear in parts and some of it wouldn't; a good many sediments in it, and after we cut the ice out of the lake, why, there would be a scum over the water where we would take it out.

Q. Was there an odor to the water, smell?

A. Well, along there late in the winter after it was froze up a while there would be, yes; after the ice got about eignt or ten inches thick.

Q. How did the water affect the fish?

A. After it was froze up it killed them.

5809 Q. Did you find any fish in the ice that you cut?

A. Yes, sir; had quite a trouble with it; we would have to chop them out in the summer time.

Q. Now, after the drainage canal was opened, in January, 1900, did you make any examination of the ice to determine whether it was fit to put up?

A. Yes, sir.

Q. What kind of an examination did you make?

A. We took a chunk of ice out of the lake, and took a chunk that we took out a year before that, and boiled them and we found that the ice that we took out of the lake was better ice than the ice that we had in the house.

Q. How about the ice in the river?

A. Well, this was taken out of the river; you might say it was right there by the spiles, you might call it the river; in front of the ice house there.

Q. How about the sediment in the ice since the drainage canal was opened?

A. We haven't noticed much sediment in it.

Q. Has there been an odor in the water since the openi of the drainage canal in the winter?

A. Well, yes, there was last winter; but we didn't notice i where we took the ice out; it was over at the dam here.

5810 Q. How did that odor compare with the time before the drainage canal was opened?

A. Well, it wasn't quite as bad last year as it was before, not near.

Q. Have you found any dead fish in the ice since the opening of the drainage canal?

A. I have not.

CROSS-EXAMINATION, by Mr. Jeffries.

Q. The curent in the river is much swifter now than it was before the canal was opened?

A. Yes, sir; quite a bit; you can't do any fishing here with a seine at all.

Q. The current is too swift?

A. Yes, sir.

Q. This ice that you have been cutting for the last nin years came from off the lake, did it not?

A. Part of it and part of it came from the river.

Q. Not from the channel of the river?

A. No.

Q. Now, you say there was a smell at the dam this last winter?

A. Yes, sir.

Q. Considerable smell?

5811 A. Considerable smell, but not as bad as it was before, not near.

Q. And a good stage of water?

A. And a pretty good stage of water.

Q. You say you found fish dead and frozen in the ice?

A. Yes, sir.

Q. Before the canal was opened?

A. Yes, sir.

Q. And that there was a smell came up from the ice—from where the ice was cut?

A. Yes, sir, and a scum.

Q. And notwithstanding all that, the scum, the smell and the dead fish, you packed the ice and sold it?

A. Yes, sir.

Q. The State Board of Health didn't condemn your ice, did it?

A. No.

Q. They didn't know anything about it?

A. No; it was supposed to purify when it froze.

Q. That is, you went on that theory?

A. It is everybody's theory, I guess.

Q. Does there any odor come from the ice now?

A. No, sir.

Q. Where it is cut?

A. Well, I don't think we are cutting any ice now at the present time out of the lake or river.

5812 **Q. Well, I mean since the opening of the canal?**

A. I haven't noticed any.

Q. What has become of the green scum or the sedimentation, as you call it, since the opening of the canal?

A. Well, I don't know what has become of it, unless the current caries it way.

H. HALL.

5813 MR. JEFFRIES: I move to strike out all the testimony of all the witnesses taken on the Illinois river, dating from Monday, July 13th to this day, Friday, July 24th, who have testified as to the character of the water before and since the opening of the Chicago Drainage Canal into the Illinois river, for the reason that said witnesses did not properly qualify themselves as being competent to express an opinion or give their judgment on the subject; and for the further reason that water may be apparently clear and at the same time be filled with germs of disease, and that testimony of the character in question is incompetent and immaterial and irrelevant.

I move to strike out all the testimony of witnesses and physicians as to the typhoid fever cases up the river for the reason that the evidence shows that the Illinois river water has not been used for drinking or domestic purposes to any extent and therefore could not be the source or cause of the increased typhoid death rate in St. Louis; and move to strike out all the evidence of witnesses testifying to the water foaming in the boilers for the reason that such fact does not prove or disprove that the water is in a better condition from a sanitary standpoint since the opening of the canal than it was prior thereto, and for the further reason that it is incompetent and irrelevant; and I move to strike out the testimony of all witnesses to the deposit of material in the Illinois river at Peoria and Pekin and other places for the reason that such 5814 fact is no justification for the right of the Sanitary District and the city of Chicago to discharge the sewage of Chicago into the drainage canal and thence into the Illinois river, and for the reason that all the testimony so taken between said dates and places is incompetent, irrelevant and immaterial.

5815 National Hotel, Peoria, Illinois. 2:00 P. M., Monday, August 10th, 1903. Parties met pursuant to agreement.

Present:—The Commissioner,
Judge Springer,
Mr. Todd,
Judge Johns,
Mr. Jeffries.

No witnesses being present, an adjournment was taken until 10:00 A. M., Tuesday, August 11th, 1903, at same place.

National Hotel, Peoria, Illinois.
5816 10:00 A. M., Tuesday, August 11th, 1903.
Parties met pursuant to adjournment.

Present, the Commissioner and same counsel representing the respective parties.

H. E. BEASLEY,

called as a witness in behalf of the defendants, being first duly sworn by the Commissioner, was examined in chief by Judge Johns and testified as follows:

Q. State your name, residence and occupation?

A. H. E. Beasley; Peoria, Illinois; City Engineer.

Q. How long have you been engineer for the city of Peoria?

A. Since the 15th day of October, 1900.

Q. As city engineer have you knowledge of and to some extent control of the construction of sewers in the town?

A. Yes sir.

Q. Has the city of Peoria a public water supply?

A. The water supply of the city of Peoria is owned by a private corporation, the Peoria Water Company.

Q. Was it at any time a public water supply?

5817 A. Until about 1888 the waterworks system was owned by the City of Peoria.

Q. And has been a private corporation since then?

A. Yes sir.

Q. From what source is the water obtained?

A. From a water bearing strata of gravel, located about three miles northeast of the Court House, or the central portion of the city.

Q. And how far from the Illinois river?

A. At ordinary stage of water I would judge it to be about 300 yards.

Q. What is the character of the means by which water is obtained, whether from wells or reservoirs?

A. From a well.

Q. How deep is this well?

A. I think about fifty feet.

Q. Do you know whether the water obtained in this well flows in from the direction of the Illinois river or from the opposite direction?

A. Well I cannot answer that positively, but in my opinion it comes in from the opposite direction.

Q. Does this single well afford enough water for the public water supply?

MR. JEFFRIES: Objected to as leading.

5818 A. There is an auxiliary well located some 330 feet east of the plant and connected with the main pumping plant by a vitrified pipe, some thirty inches in diameter, either 24 or 30 inches in diameter.

Q. How far from the Illinois river at ordinary stage is this auxiliary well?

A. Not more than 25 feet.

Q. With reference to the basin, bottom or uplands, where are these wells.

A. Located in what might be called the bottom lands.

Q. Are they subject to overflow and periods of high water in the Illinois river?

A. Not in the vicinity of the well, no sir.

Q. In your opinion do the bottoms of these wells extend below the ordinary level of the bottom of the Illinois river?

A. Yes sir.

Q. Are there in the city of Peoria or vicinity large establishments which have their own private water supply?

A. Yes sir.

Q. How many of these?

A. All the distilleries, the glucose works, in fact all large corporations located along the river bank.

5819 Q. If you know you may state from what source these corporations and manufactories obtain their water?

A. In all cases from wells sunk to this water-bearing gravel.

Q. In a general way, where are the wells located with reference to the Illinois river?

A. Located within from 100 yards to 300 yards of the water at ordinary stage.

Q. What amount of water is pumped into the public water supply here, stated in gallons, per day or month?

A. I am unable to state that positively, but I would judge it to be in the neighborhood of five or six million gallons every 24 hours. I might further add that the city of Peoria receives no information regarding the number of gallons of water pumped per diem, from the water company.

Q. What is the population of the city of Peoria?

A. The census of 1900 gives the population of Peoria as 58,600.

Q. Has there been any increase since?

A. Yes sir, a conservative estimate of the present population I would place it about 70,000 to 73,000.

Q. After being used for domestic and manufacturing purposes what becomes of the water from the public water supply?

A. In a large majority of cases it is turned into the 5820 public sewers of the city.

Q. If you are able you may state how many connections there are in the city of Peoria, with the public water supply?

A. I cannot state that.

Q. What person in the city of Peoria would be able to state that?

A. An official of the Peoria Water Company.

Q. If you are able you may state the number of connections from houses and business places, with the public sewer?

A. We have official records in the office of the connection of about 2500 connections with the public sewers. This record is not complete and I would judge that there would be in the neighborhood of 3,000.

Q. In what kinds and classes of places are these connections?

A. From all buildings, residences, hotels or any other public building.

Q. Are there hospitals in Peoria?

A. Yes sir.

Q. How many?

A. Three.

Q. Are they connected with the public water supply and do they discharge their sewage into the public sewers?

A. Yes sir.

5821 Q. How many public schools in the city of Peoria?

A. I would judge there were in the neighborhood of fifteen.

Q. From what source do they receive their water supply and where is their sewage disposed of?

A. In most cases from the public water supply and whereever they have sewers they discharge their sewage into the public sewers.

Q. In the instances which we have mentioned, where corporations and manufacturers have their private water supply into what is their sewage discharged?

A. Into their own private drains, leading into the Illinois river.

Q. Where is the city of Peoria situated with reference to the Illinois river?

A. On the west bank of the Illinois river.

Q. For what distance does it extend on the river?

A. It extends about five miles along the bank of the river.

Q. Is there a creek near Peoria known as Kickapoo Creek?

A. Yes sir.

Q. As to the current of the Illinois river, is that creek above or below Peoria?

A. Below.

Q. How far?

5822 A. It empties into the Illinois river very close to the south-western corporate limits of the city.

Q. If you know you may state the the length of Kickapoo Creek and its general size?

A. The creek is about eighteen miles in length and of an average width of about—in low water not more than ten or fifteen feet wide in places. In high water, it overflows and extends over the lowlands to a width of three hundred feet.

Q. Does this creek receive any of the sewage of Peoria through the public sewers?

A. No sir.

Q. Does it receive any from the private sewers?

A. There may be a few connections located in what was formerly North Peoria, now the city of Peoria, which we have no knowledge of as city officials.

Q. As an individual, if you have any knowledge as to the amount discharged through sewers or ditches into Kickapoo Creek, you may state the amount and from what sources?

A. The discharge of sewage into Kickapoo Creek, that is, eventually reaching the creek, is that from five or six house connections.

5823 Q. Does Kickapoo Creek become dry in its bed during any season of the year?

A. No sir, there is always an amount of water in the creek, at all times of the year.

Q. Is there a place near Peoria known as Averyville?

A. Yes sir, located north of the city and lying along the bank of the Illinois river, being about one mile in length and about three-quarters of a mile in breadth.

Q. Is it a village or a part of the city?

A. It is a distinct corporation, being a village.

Q. Describe the situation—the physical conformation of the city of Peoria with reference to the Illinois river?

A. The city of Peoria is located on the bank of the Illinois river, the ground rising from the river bed to the bluffs, and extending back from the brow of the bluff a distance of approximately a mile and a half.

Q. How high is this bluff?

A. About 200 feet above the river bed in some portions—from 150 to 200 feet above the river bed.

Q. How far in a general way, from the bank of the river to what might be termed the foot of the bluff?

A. From three-quarters of a mile to about a mile and a half.

5824 Q. Into what does the surface drainage of the streets, alleys and public areaways of Peoria flow?

A. Into the public sewers, wherever they are located.

Q. And in places where there are not sewers, where does it finally empty?

A. It empties into the Illinois river, through conduits or ditches.

Q. Are the streets of Peoria washed and kept clean by water?

A. No sir.

Q. How is that done?

A. The streets are kept clean by men with brooms or other tools, and the refuse is deposited in various places, including the dumping grounds, none of the material being thrown direct into the river.

Q. Where is the principal dumping ground for the street sweepings?

A. Along the river front in what is known as the levy, has been used as the principal dumping grounds, the larger portion however, being distributed on lots which are lying low, throughout the city.

Q. Where does the seepage from these dumping grounds in cases of storm finally discharge itself?

A. It distributes itself throughout the grounds.

Q. What is done in Peoria with the garbage, the refuse
5825 matter from households, and hotels, saloons and restaurants?

A. I could not state as to that.

Q. Over how much of the corporate limits of the city of Peoria is there a system of public sewers?

A. The corporate limits of the city are 8.40 square miles. Of this 3.41 are sewered, being about forty per cent of the total.

Q. In your judgment, what percent of population discharge their household and other sewage into the public sewers?

A. I would state in my opinion about one-quarter or one-third or about 33 per cent discharge their sewage into the city sewers.

Q. Into what is the household sewage of the other 66 per cent discharged?

A. Into vaults.

Q. Is there a system here to clean these vaults?

A. There are private parties who do that work yes sir; it is not connected with the city, though.

Q. I hand you now a paper on which is printed at the upper left hand corner "City of Peoria; Sewer Map, January, 1898." and ask you to state what the paper is as a matter of fact?

A. The paper represents the sewers of the city of Peoria; the entire sewer system of the city of Peoria at that date. I have further added in it lines which represent what is known as the Persimmon Street and Chestnut Street sewer sys-
5826 tems, which have been constructed within the past year.

Q. What portion of the city of Peoria is represented on that map? In other words, does it represent the entire city of Peoria or only such portion of the city as is sewered?

A. It represents the corporate limits of the city of Peoria before the annexation of what were formerly known as North Peoria and South Peoria. This map represents an area of approximately five square miles.

Q. If it is drawn to a scale, what is the scale?

A. The scale is marked on the map, this being a photograph reproduction, it is not drawn to any scale of inches,—and any measurements can be made by using the scale in the upper left hand corner.

Q. What are the different characters, of physical construction of the sewers in the city of Peoria?

A. All the sewers of Peoria are constructed on what is known as the combined system, taking in household and surface water, being constructed of vitrified tile—the larger sewers of brick.

Q. Are these sewers represented upon that map and if so how are they designated, and in answer you may explain the map fully.

5827 A. The map represents the entire sewerage system of the city of Peoria, the various systems being shown thereon; the sewers themselves are indicated by red lines; the size of the same being marked immediately above or below each red line.

Q. In inches or feet?

A. In inches. There is an omission of what—of a plat of ground known as the Uplands Addition located above Main Street between University Street and Cooper Street, produced. This is an area of about 85 acres, sewered and paved.

Q. How are the brick sewers designated on the map?

A. The brick sewers are designated by the fact that the lines are crossed; there is a note in the upper right hand corner, which is explanatory of the markings of the map.

Q. How are the tiled sewers designated?

A. By straight red lines.

Q. What is the entire length of the brick sewers of Peoria as they are now in existence?

A. The brick sewers of Peoria are about 21 miles in length; the pipe sewers about 58 miles in length.

JUDGE JOHNS: I now hand the Commissioner map described by the witness and ask him to mark it defendants Exhibit No. 1.

Received and so marked. Map not reproduced.

MR. JEFFRIES: I object to the introduction of the ex-
5828 hibit for the reason that it is incompetent and immaterial and does not prove or disprove any issue in the case, and

for the reason that any and all evidence with reference to the condition of the sewers of Peoria and the discharges of the sewage or other matter into the Illinois river does not justify Chicago in the discharge of its sewage into the river by means of the drainage canal.

I renew the objection heretofore made with reference to all testimony of witnesses at various towns and cities on the Illinois river with reference to the discharge of sewage and other matters into said river, for the reasons stated in said objection.

It is hereby agreed that every possible objection pertinent to any question to any witness may be considered as having been made by complainant to defendants testimony, with respect to the character of the deposits or discharges into the Illinois river from its mouth to Lockport dam, and this objection shall go either as to the form of the question or substance of the question.

F. S. B., COMMISSIONER.

Q. JUDGE JOHNS: Is this map Exhibit 1, a correct representation of the location of the sewers in the city of Peoria?

A. Correct as to the streets in which they are located?

Q. (Question read).

A. Yes sir.

5829 In so far as is stated in the former explanation of the map.

CROSS-EXAMINATION,

By Mr. Jeffries.

Q. How long have you lived in Peoria?

A. Since 1872.

Q. And you have been city engineer of Peoria since 1900?

A. Yes sir.

Q. What month?

A. October 15th, 1900.

Q. How old are you?

A. I will be 31 my next birthday.

Q. You say all of the people living in Peoria do not obtain their water from the waterworks company?

A. No sir, for the reason that the mains of the Peoria Waterworks do not extend all over the city of Peoria.

Q. Will you state what portions of the city are without water mains?

A. What was formerly the village of North Peoria. Also a portion of what was formerly known as South Peoria.

Q. The people living in Peoria who don't obtain their water for domestic and drinking purposes from the water supply of the Peoria Water Company, have independent wells of their own have they not?

A. In some cases; other cases they have cisterns.

5830 Q. They have either wells or cisterns?

A. Yes sir.

Q. When the people of Peoria—Do any of the people of Peoria use the water of the Illinois river for domestic purposes?

A. Not unless it is those that live in shacks or house-boats on the banks of the river.

Q. And they are of a transient character, are they not?

A. Well, they are a class who do not amount to anything, being that of the rougher, lower element.

Q. The character of the earth in which these wells are dug, is gravel and sand, or what is the character?

A. The gravel from which they receive the water is gravel or sand, being below the clay and loam of the surface.

Q. Do you know how thick this strata of sand and gravel is?

A. Why it is varying depth; I could not say how thick it is.

Q. Do you know whether any of these wells are sunk to a sufficient depth to go through the entire strata of gravel?

A. No sir, they are not.

Q. I understood you to say that in your opinion this water coming in through this gravel into the wells, came from a direction opposite the river?

A. That was with direct reference to the water of the Peoria Water Company.

5831 Q. In other words it comes from the bluff?

A. It comes from the bluff.

Q. The river being on the south and the bluff on the north?

A. The river being on the south-easterly side.

Q. What in your opinion is the difference between the source of the supply in the well of the water company and that of the private wells?

A. The well of the water company—or the water from the well of the water company is taken from the lower side of an impervious strata of clay or shale; the private wells throughout the city are from above this point.

Q. What is the average depth of a private well?

A. That would be hard to state.

Q. Well, in your judgment?

A. From fifteen to thirty feet.

Q. Now they are sunk in gravel also, are they not?

A. The private wells?

Q. Yes?

A. They reach into the gravel, yes sir.

Q. You say none of the solid matter in the way of refuse is discharged or emptied into the sewers?

A. Not to my knowledge.

Q. It is carted away?

A. Yes sir.

5832 Q. But you don't know where it is dumped?

A. No sir.

Q. Haven't you in the course of your work observed the places where they have been dumping this refuse?

A. No sir.

Q. It is not dumped into the river, however?

A. Not to my knowledge.

Q. Describe the character of the surface of the river in and around Peoria, that is, the character and nature of the soil?

A. The soil—the top soil being loam; in some places fine sand, underneath that is gravel; beneath that comes the shale or clay; underneath that we find in most cases a gravel which bears considerable water.

Q. You don't know the amount or extent and character of the matter that is discharged from the distilleries, glucose and other factories of Peoria, do you?

A. No sir. I am not able to state that: that being discharged through their own private drains.

H. E. BEASLEY.

5833 Peoria, Illinois, August 11, 1903.

PETER CASEY,

called as a witness in behalf of the defendants, being first duly sworn by the Commissioner, was examined in chief by Mr. Todd and testified as follows:

Q. What is your name?

A. Peter Casey.

Q. Where do you live?

A. Peoria, Illinois.

Q. What is your business?

A. I am manager of the Corning Distilling Company.

Q. How long have you been manager of the Corning Distilling Company?

A. Since June, 1901.

Q. What was your business before that?

A. From August 1895 until June, 1901, I was manager of the Whiskey Trust, known as the American Spirits Company, commonly called the Whiskey Trust.

Q. How many distilleries were included in the so-called whiskey trust in Peoria?

A. At the time I had the management, there were four active distilleries.

Q. Were these distilleries located in Peoria?

A. Yes sir.

5834 Q. Did you have the management of those four distilleries?

A. Yes sir.

Q. From 1895 up to 1900, about how many cattle were fed by the distilleries over which you exercised supervision?

A. Well, it ranged from 20,000 to 12,000; the most we ever fed was in 1896, I think; we fed 20,000 then.

Q. About how many were fed each year after that, from 1896?

A. Well I think in 1897, to the best of my recollection, somewhere in the neighborhood of 15,000; in 1898 I think it was probably 12,000 or 14,000; in 1899 I think probably we fed 12,000; in 1900 I think we probably fed 8,000—may be 10,000, I don't know just exactly; I haven't got the data; in 1901 it was about 10,000; in 1902 I think we fed at that time 8,000.

Q. What was the capacity for these years of the distilleries known as the trust distilleries, in bushels?

A. Well in 1896, we run a capacity of between 17,000 and 18,000 bushels a day.

Q. Will you describe in a general way how the corn was treated and how the cattle were fed in these distilleries, and what became of the excreta of the cattle?

A. Well the corn is first ground into meal; then it is put into large cookers and cooked up to about 65 or 70 pounds pressure, the cookers are closed; that is supposed to break up all the starch in that corn, and destroys all the bacteria 5835 in the grain that would contaminate fermentation. After this meal is thoroughly cooked up at that pressure, the heat is drawn out by a vacum and malt is added then to convert the starch into sugar. After the conversion is complete it is fermented, yeast is added to it and at the expiration of the fermenting period which is 72 hours, it is separated over what is known as a beer still; that separates the whiskey from the slop, and the slop is then pumped to the cattle and fed to them; sometimes we feed them three times a day and sometimes twice.

Q. What is this slop composed of?

A. Well it is principally composed of protein and fat; it has a certain amount of moisture and with other minerals in there such as ashes, etc.

Q. What percentage is protein and what percentage is fat as disclosed by analysis?

A. Well that varies some according to the quality of the corn we use; the minimum average, about the average protein is 33 per cent, and fat about 11 per cent.

Q. And the other 64 per cent are the other minerals that you speak of?

A. Yes sir.

5836 Q. Describe the cattle sheds in which the cattle are fed? And the manner of feeding them?

A. Well, the sheds are built where there are troughs, racks; the cattle stand with their tails together in the one section—they are built in sections. The slop is supplied to them—a large tub is pumped into from the distillery. The offals from the cattle are pushed out not less than twice a day into a sewer which is directly behind each steer, one headed this way and one headed this way, and they are behind each steer; that is pushed out into the main sewer that runs through the middle of the cattle barn, and water is used to flush that into the river.

Q. What else is fed to the cattle besides slop?

A. Hay and cotton-seed hulls and sometimes cotton-seed meal.

Q. What is the purpose of feeding hay, cotton-seed meal and cotton-seed hulls?

A. The object of feeding hay and cotton-seed hulls is to retain the slop; otherwise it would run through and they wouldn't get any benefit of it. Cottonseed meal is used to advance the cattle when they haven't sufficient slop to feed them with.

Q. How many cattle are fed from the slop of one bushel of corn?

A. The rule is to feed a bushel of slop to every steer, 5837 but lately that has been modified considerably; they don't feed them that now; about three-quarters of a bushel and finish up with cottonseed meal or something of that kind to tide them over.

Q. How many gallons in a bushel of slop?

A. There is about 31 gallons, that goes to the cattle; ordinarily there is forty, but about nine or ten gallons of that it taken back to mash back again several times which leaves net from 30 to 31 gallons.

Q. About how much hay is fed to a steer daily?

A. That varies considerably. I should judge somewhere in the neighborhood of seven to ten pounds; sometimes as high as fifteen.

Q. When hay is fed, are the cottonseed hulls fed also?

A. Yes sir.

Q. About how many pounds of hulls are fed on an average?

A. Well, from a pound and a half to two pounds.

Q. Are the cattle salted?

A. Yes sir, salted frequently.

Q. What is the manner of salting the cattle?

A. The salt is just thrown along on what is called the hay board there, for them.

5838 Q. Does any of the salt become wasted and go into the sewer before taken by the cattle?

A. Yes, I suppose some of it does go through, probably a little.

Q. Is there any way of measuring the amount of salt that is fed to 10,000 cattle?

A. Well I think there is, but I don't know what it is.

Q. How much salt is consumed a week in the feeding of these cattle?

A. Of 10,000 head?

Q. Yes.

A. Well I should judge about ten or fifteen barrels.

Q. About how much is given to each steer daily?

A. How much salt?

Q. Yes sir.

A. Why, really I don't know; I never gave that much attention.

Q. When the excreta of the cattle fed is scraped into the sewer running between the two rows of cattle in the pens as you have described, where does that urine and manure from the cattle go?

A. It goes into the river.

Q. How far are these cattle sheds at Peoria located from the banks of the river?

5839 A. Some of them are directly on the bank of the river and the furthest I think is about 700 feet.

Q. When this offal or excreta of the cattle is carried to the river, what becomes of it?

A. Well the current takes it down I suppose, and in running where you have quite a distance to run that out, there is a large trough that runs from the cattle barns to the river; sometimes the hay is thrown off on the ground on both sides, and it doesn't run through the trough into the river.

Q. Are there times when this manure accumulates on the banks of the river?

A. Yes sir.

Q. How extensive are these accumulations?

A. Well, they have been pretty extensive; this last high water took them all away again, about two years, most of them were removed.

Q. In the absence of high water how are they removed?

A. They just lay there and disintegrate; sometimes they are fired by spontaneous combustion in the summer, if it gets very dry.

Q. Have they at any time been dislodged by steamboats and floated down the river in large islands?

A. Oh yes.

5840 Q. When that condition obtained, what became of the islands?

A. Well, the islands several times lodged against Pekin bridge down there. I was notified by the Board of Health to come down there and take it away, and we did so; after that we never heard anything from it.

Q. Were these islands of manure so large that they couldn't pass between the piers of the Pekin bridge?

A. Yes sir.

Q. Have you observed the condition of the water of the Illinois river before the opening of the drainage canal, at Peoria and since the opening of the drainage canal?

A. Yes sir.

Q. Will you describe the condition of the river at Peoria before the opening of the drainage canal?

A. Well the condition of the river at Peoria before the opening of the drainage canal, below Peoria was very bad; it smelled so bad sometimes we could hardly stand it along there. The water seemed to be perfectly stagnant, and there was no life to it at all.

Q. Did you observe any gas bubbles in the water?

A. Well I have noticed a foam on it.

Q. What caused that condition of the river at Peoria?

A. I think it was the offal from the cattle barns in my opinion.

5841 Q. What was the condition of the water above where it received the offal of the cattle barns?

A. It was a great deal better, but nothing like it is now.

Q. Since the opening of the canal and the turning of lake Michigan water into the Illinois river, what has been its effect upon the condition at Peoria both where the water of the Illinois river receives the sewage discharged from the distilleries and cattle barns, as well as above the point where such sewage is received into the Illinois river?

A. Well I consider that it is very much improved in every way, especially for mechanical purposes.

Q. How about the stench in the river from the place of contact with the sewage of the distilleries, meaning by that the out-falls from the cattle-sheds for four or five miles down stream?

A. Well I think the river on an average is more polluted than it was before; a constant pollution, I will say.

Q. (Question read).

A. Oh since; I haven't noticed any stench since the opening of the canal, to amount to anything. I didn't exactly understand Mr. Todd's question previously.

Q. Have you noticed any improvements in the water ot the Illinois river from the railroad bridge down stream for a distance of three or four miles since the opening of the 5842 drainage canal, and the conditions previous to that time?

A. Oh yes, there is a great improvement in the river.

Q. What is the condition of the water today as compared with before the opening of the drainage canal as to purity?

MR. JEFFRIES: I object to the question for the reason that the witness has not properly qualified himself to express an opinion as to the purity of the water.

Q. (Question read). In your opinion?

A. In my opinion, it is purer than it was before.

Q. Please state what facts and reasons you have for entertaining that opinion?

MR. JEFFRIES: Objected to for the same reason.

A. Well, I only know those facts in a mechanical way; that is, the water in our boilers, we don't have that foaming now as we used to have; and we don't have that slimy formation on the coolers or condensors that we formerly had.

Q. Will you state at length how the water of the Illinois river before the opening of the drainage canal, acted in the generation of steam and other manufacturing purposes for which it was used, and what changes, if any have taken place since the opening of the drainage canal?

A. When I was with the American Spirits Manufacturing

Company we operated four distilleries at one time; the
5843 Great Western Distillery, the Manhattan Distillery, the
Grove Distillery and the Monarch Distillery. The Great Western Distillery was located above any of the cattle barns. We had less trouble there than most anywhere else, with slime both in the boilers and in the coolers. The Manhattan Distillery was located below the great Western Cattle barns on the river; we had considerable trouble there.

Q. In what way?

A. From water foaming in the boilers and the slime on the condensors and coolers. The Grove Distillery was located below the Manhattan Cattle barns and the Great Western cattle barns, and we had about the same amount of trouble there that we did at the Manhattan. The Monarch Distillery was located below all of the cattle barns except the Monarch cattle barns, and we had a great deal of trouble there. We had our river pipes out farther than any other pipes, and we were constantly pulling it up to get out the accumulation of slime and manure, and so forth. We have at times pumped nothing, but which looked like excrement from the cattle barns, up through that pipe.

Q. This trouble that you speak of, manifests itself in what way with the machinery?

A. Well, it causes the boilers to foam; an accumulation of
slime on the coolers and condensors, and gave us trouble
5844 in various ways.

Q. Did these four distilleries of which you speak, take their water from the Illinois river for steaming and condensation purposes?

A. Well, they did for steaming purposes; part of the water for condensation purposes was taken from wells.

Q. Take the distillery that took its water from the Illinois river before the Illinois river had received the discharge from the cattle-sheds, prior to the opening of the drainage canal—how did the water—how does the water used in that distillery before the opening of the canal, compare with the water that is used since the opening of the canal, for mechanical purposes?

A. Oh, the water is very much better now. In fact, I haven't heard of any trouble at all lately.

Q. You had trouble in all of the distilleries with the water before the opening of the drainage canal, did you?

A. At times we did, yes, sir; some more than others; those that were lower down.

Q. Since the opening of the drainage canal, how has the water from the Illinois river, which is used for mechanical purposes in these distilleries, compared with the water of the Illinois river used for mechanical purposes, in these distilleries?

A. Well, I have only had experience with one distillery
5845 recently; that is the Corning Distilling Company; that is
below all the houses that I have named.

Q. Further down the river?

A. Farther down, yes, sir; we haven't had any trouble at all.

Q. Did you have any trouble with the water of the Illinois river from 1900 to June, 1901, in the distilleries that you have mentioned, after the opening of the drainage canal?

A. In those years we only operated two of these distilleries, the Great Western and the Monarch, and they gave us very little if any trouble.

Q. Where do you get the water for steaming and mechanical purposes for the Corning Distillery, of which you are now manager?

A. Part of it from the river and part from driven wells.

Q. What are the uses to which the river water is put?

A. Well, it is used for mashing purposes and for feeding purposes, and cooling purposes, in the first stage of the cooling; they wind up the cooling with well water,—and for boiler purposes entirely—entirely for boiler purposes if possible.

Q. How does its usage today compare with its usage for the same purposes before the opening of the drainage canal?

MR. JEFFRIES: Objected to as a repetition.

5846 A. We consider it very much better.

Q. How is the water taken out of the river?

A. By pumps.

Q. Have you a supply pipe that runs out?

A. Yes, sir; we have got a twenty inch pipe running out.

Q. How far out in the river do you take the water?

A. Well, we are 250 feet out from the bank.

Q. How many pounds of excreta does a steer discharge in 24 hours?

A. Well, I really don't know, but considerable. I never tried to ascertain that; I couldn't positively say.

Q. How many pounds of salt in a barrel such as you speak of?

A. 280 pounds.

Q. And how many barrels of salt is fed to 10,000 cattle?

A. I should judge about ten to fifteen barrels a week.

Q. How long is a steer kept for fattening purposes before he is ready for market?

A. Well, that varies considerably, Mr. Todd; we formerly kept them nine months; now they endeavor to get them out in six or seven months.

Adjourned until 1:30 p. m., same day.

5847 Met pursuant to adjournment at one-thirty p. m.

Peoria, Ill., August 11, 1903.

LEWIS A. McFADDEN, called as a witness in behalf of the defendants, being first duly sworn by the Commissioner, was examined in chief by Judge Johns and testified as follows:

Q. Doctor, state your name, residence and occupation?

A. Lewis A. McFadden; residence, 305 North Madison avenue, Peoria, Illinois; occupation, physician and surgeon.

Q. How long have you lived in Peoria?

A. Since July, 1887. Fifth of July.

Q. Have you practiced your profession here during that time?

A. I have, continuously.

Q. Did you ever occupy any official position here?

A. I have.

Q. What was it?

A. I was county physician of Peoria county for five years. I was one of the United States pension examiners under President Cleveland's administration; was alderman from the First ward for four years, and also commissioner of health from October, 1901, until June, 1903.

5848 Q. During what period were you county physician?

A. I think it was from 1890 to about 1895 or 1896. That is my recollection of the years.

Q. As county physician, what were your duties?

A. To look after the poor of the city who were not able to employ a physician; to treat the prisoners in the jail and work-house who were sick, and also look after the inmates of the county almshouse.

Q. Did that position bring you in contact and acquaintance with a class of people who lived and existed upon the banks of the Illinois river at Peoria?

A. Yes, sir.

Q. In your judgment how many people in or near the city of Peoria live either immediately upon the banks of the river or upon the water of the Illinois river?

A. Well, I think when I was county physician, there must have been as many as 500 living in cabin boats on the river and along the river.

Q. How many in your judgment lived along the banks of the river in house-boats while you were the commissioner of public health?

A. Well, I should think about 400. I don't think there was quite so many as there were a few years ago.

Q. Do you know how many people, or have you an opinion as to how many people in the city of Peoria use the water
5849 of the Illinois river for domestic purposes?

A. You mean from the wells?

Q. No, directly from the river?

A. I couldn't say exactly as to the number. A great many of the people living on the cabin boats get their water from the springs along the river bank. Some of them from the dug wells on top of the bank, and others use the city water by carrying it from hydrants, I suppose.

Q. What was the condition of health of the people living along the banks of the Illinois river in this vicinity prior to the opening of the drainage canal in January, 1900?

A. I found a great deal of sickness among them, more than in any other part of the city.

Q. Of what character of diseases?

A. Malaria, malarial diseases, dysentery and typhoid fever.

Q. To what did you attribute those diseases at that time?

A. Principally to their mode of living and to the use of the river water.

Q. Since the opening of the drainage canal in 1900, what in a general way has been the health of that same class of people?

A. The health of those people is certainly as good now as it was before.

Q. Do you know of any typhoid fever among them since the opening of the canal?

5850 A. There may have been some cases; but none to my knowledge.

Q. Were you familiar with the condition of the water of the Illinois river above Peoria prior to the opening of the drainage canal, and if so, you may describe it?

A. I was only familiar in a general way, like any other citizen. The water has never been considered very good, there is so much stagnant water in the vicinity of Peoria, and in the summer time the waters have never been considered very good here; not fit for drinking purposes or domestic use. Across the river it was always covered with a green scum, and in many places there was quite a stench arising from decayed vegetation.

Q. Prior to the opening of the drainage canal, what was the condition of the Illinois river on the river front of Peoria and below, after having received the sewage of the city of Peoria?

A. The water never was so good, or so pure and wholesome in front or below, on account of the Peoria sewage that in various ways found its way into the river, and the slops from the distilleries that flowed into it.

Q. Since the opening of the drainage canal, as compared with the water before the drainage canal was opened, what has been the condition of the water above Peoria?

5851 A. So far as anyone could observe, the water is about the same, only there is more current; otherwise the water is about the same as it was before.

Q. Does this green scum form upon it now?

A. Yes, sir.

Q. Do you know whether that is the same as the fishermen and hunters call duck-weed?

A. Some of it is, yes, sir; some of it is kind of like a moss, such as you find in stagnant waters in some localities when the weather is warm.

Q. In the government of the city of Peoria, is there a department known as the health department?

A. There is.

Q. You may state whether the statistics of the causes of death in the city of Peoria are kept in that office, that record?

A. They are.

Q. Have you examined those records with reference to deaths from typhoid fever in Peoria for seven or eight years past?

A. I have since 1895.

Q. You may state the number of deaths from typhoid fever shown by these records in your examination, from 1895 up to the present time, giving it by years?

5852 A. Well, I haven't got the number of deaths for 1895. In August and September, in 1895, there were 45 cases of typhoid fever reported to the health department. This is a greater number than has ever been reported during the same time—same length of time since. But in 1897—1896 I haven't got—in 1897 there were fifteen deaths in the city of Peoria; in 1898 there were 18 deaths; 1899, ten deaths; 1900 there were 17; 1901 there were twelve; 1902 eighteen, and so far during the present year there have been three deaths.

Q. While you were Commissioner of Health and an officer of the city here, what was the practice in regard to the dejecta of typhoid patients?

A. The—in the families where typhoid fever existed, they were instructed by a sanitary officer to disinfect the stools and also to destroy them by boiling or burying.

MR. JEFFRIES: I move to strike out the answer as not responsive to the question.

Q. By the term "stools" do you include the discharges of urine as well as the fecal matter?

A. Yes, sir.

Q. While you were health officer, state whether or not these directions of the health department were observed?

A. To the best of my knowledge they were.

5853 Q. You have spoken here of wells from which people obtain water along the river, as a general rule, in this vicinity where are those wells and how deep are they?

A. We have some public wells in the city, perhaps a half a dozen; some of them close to the river and others further back, below the bluff. The depth of these wells is about 60 or 70 feet. Then there are about 60 private wells in the city; and also wells along the river bank that are used for—I don't know what they use them for, but the distilleries and factories, I suppose, use them for their engines and boilers; and some of the employes drink the water.

Q. Are these wells along the river supplied by water from the Illinois river or from an underlying strata of gravel in which the water flows?

A. A certain amount of this water must come from the river, as I understand the wells rise and fall with the height of the river.

Q. That is to say, the depth of the water in the wells corresponds to the height of the water in the river?

A. Yes, sir.

Q. Do you know whether there are cess-pools and privy vaults in the city of Peoria, and if so, how many?

A. Great many cess-pools in Peoria, but the number I
5854 am not able to state—cess-pools and privies. There is a
great portion of our city that is not sewered, and a great many persons living adjacent to sewers have not yet got connected with them.

Q. What per cent. of the population of the city of Peoria discharges its household sewage into the public sewer system?

A. I think it would approximate about one-third of the population.

Q. What is the practice of the department of public health in reference to the privy vaults and cess-pools?

A. The sanitary officers of the city during the spring and summer season, make a house to house canvass and when they find the privy vault filled within four feet of the top and the cess-pools nearly full, they give them notice—to the owner of the property, to have them cleaned out within a reasonable time, say about five days.

Q. By whom then are the vaults and cess-pools cleaned, public authority or private enterprise?

A. They are cleaned by sanitary engineers, who pay a license to the city for the privilege.

Q. Into what place are the contents of the privies dumped?

A. They get a permit from the city health department.

Q. After they are cleaned do the officers or persons having the permits report back to the department of public health as to the cleaning of vaults or cess-pools? 5855

A. No, sir; this is not usually done. After the permit is given to them, it is taken for granted that the work is done, and unless some complaint comes in or a report comes to the health department that the work is not done, they don't often go back and inspect. Sometimes we find people arbitrary; then those cases are looked after carefully.

Q. Into what place are the contents of the vaults and cess-pools deposited?

A. In the current of the Kickapoo Creek, near where it empties into the Illinois river.

Q. Do these materials then pass naturally into the Illinois river?

A. They do.

Q. You may state how many permits were issued during your administration of the health department, for the cleaning of such vaults and cess-pools?

A. About 750 a year.

CROSS-EXAMINATION, by Mr. Jeffries.

Q. Do you know, doctor, how often these cess-pools and privy vaults are cleaned?

A. No, sir; there is no stated time for cleaning them; 5856 some are much deeper than others, consequently do not need to be cleaned so often.

Q. None of them are cleaned as often as two or three times a year, are they?

A. Yes, sir; some of them are cleaned as often as five or six times a year, and some as often as twenty times a year.

Q. That's comparatively few of them, however?

A. Very few. I think the Home for the Friendless clean their every week or two weeks.

Q. There is no record of the amount of deposits taken from these cess-pools and privy vaults, is there?

A. No, sir; no record kept.

Q. And some of them are never cleaned, because of their depth and the small amount of matter that is deposited in them?

A. Possibly some of the old cess-pools that are scarcely used,—people connected with sewers—it may be for years and years they are not cleaned.

Q. Doctor, to what school of medicine do you belong?

A. The regular school.

Q. How long have you been practicing?

A. Since 1881.

Q. What school did you take your course of medicine in?

5857 A. Two years in the Miami Medical College at Cincinnati, Ohio, and graduated from the Kentucky School of Medicine at Louisville, Ky., in 1881.

Q. There were no records kept of the deaths from typhoid fever in Peoria prior to 1897, is that correct?

A. I can't answer that question. They were very careless about keeping the records, however, prior to that time.

Q. And they are not reliable, if they did keep them?

A. I don't think that prior to that time they would be very reliable for the simple reason it was not necessary to have a burial permit.

Q. Now, doctor, prior to the opening of the canal, from 1890 to 1895, I understood you to say that there were abot 500 people living along the river in cabin boats, at Peoria?

A. In cabin boats and shacks along the river banks; some of them lived right on top of the bank; but they were practically the same kind of people we found living in the cabin-boats.

Q. Their principal business was fishing, then, wasn't it, or did they have any business?

A. Some of them had no business; some of them worked in shops or factories; others fished; just drifted in and stayed a little while and went away to where they came, so the population along the river bank was constantly changing.

Q. A kind of floating population?

5858 A. Yes. I think about two-thirds of the people living there remained there permanently.

Q. Now from 1901 to May, 1903, or during the time that you occupied the position of health officer, there were about 400 of those people living along the river?

A. I would estimate the population at about 400, to the best of my knowledge.

Q. You stated, doctor, that prior to the opening of the drainage canal the character of the diseases which affected the people along the river, were malaria, malarial fever, dysentery and typhoid fever?

A. Yes, sir.

Q. How many cases of typhoid fever were there among that class of the people here at Peoria for three years prior to the opening of the canal?

A. I have no idea.

Q. They are subject to the same disease, to-wit, typhoid fever, now as during the period previously mentioned?

A. Yes, sir.

Q. How is that disease contracted by that class of people?

A. Typhoid fever?

Q. Yes. I understood you to say in regard to them, that it came from drinking the water of the river?

A. No, sir, I didn't say that.

Q. What did you say?

5859 A. Well I didn't say that. It might come from that. If there are typhoid germs in water and a person drinks that water, he is liable to contract typhoid fever. If those germs are in milk, in food that he drinks or eats, he is also liable to contract it. It is supposed that flies carry this disease, or the disease germs.

Q. The water in the Illinois river is not used by the people of Peoria to any great extent for domestic and drinking purposes, is it?

A. No sir.

Q. Do you know the extent to which it is used? By the people living along the river?

A. Well, a few of them use it; but as I said before most of the families get drinking water and water for domestic purposes from springs along the bank or from dug wells or from the hydrants or cisterns.

Q. The water that is used by the people here in Peoria for domestic and drinking purposes, comes from wells that are driven into the ground and is filtered through the sand, is it not?

A. Yes sir.

Q. So that it makes no difference whether it comes from the river—river water, or from some other source, it goes through a process of filtration?

A. Yes sir.

5860 Q. What do you say, doctor, of the process of filtration by which the water which is used by the people of Peoria is subjected so far as the sanitary condition of the water is concerned, and its effect upon the sanitary condition of the water?

A. Well, I think that the filtration helps to purify it.

Q. You don't recommend the water from the river as being suitable for domestic and drinking purposes since the opening of the canal?

A. I don't think it is any more suitable now than it ever was.

Q. Then you wouldn't recommend it?

A. No sir.

Q. I understood you to say, doctor, that since the canal was opened, a green scum forms on the river at times the same as it did prior to the opening of the canal?

A. Yes sir.

Q. Describe the character of this green scum?

A. There is a scum in the bogs in the low-lands where the water remains stagnant. In high water the water flows back on these low-lands and bogs and part of the water doesn't find its way back into the river, only by seepage I suppose; it gets out by evaporation.

5861 Q. That produced by decaying vegetation and the stagnant condition of the water?

A. Yes sir.

Q. That causes the stagnation of the water?

A. No, that don't cause the stagnation of the water. That causes this scum.

Q. The water in the river is not stagnant now because at all times of the year there is a good current, isn't that true?

A. It is not stagnant in the river proper.

Q. That's what I mean. In the channel?

A. No sir.

Q. This green scum and the stagnated condition is removed by reason of the current in the channel?

A. I think so to a greater extent than formerly.

Q. Then the fact, doctor, that the water in the river is not stagnated and that there is no green scum in the main channel of the river, because of the current and flow of the river, does not mean that the water contains nothing injurious, or that it contains less impurities than it did when there was practically no current before the opening of the canal?

A. I don't take the ground that there are more impurities or less impurities. I think a chemical analysis shows it always to be more or less impureness in the waters of the Illinois
5862 river, at least since the banks have been inhabited.

Q. What I mean doctor, is that the absence of the green scum and the stagnant condition does not necessarily imply that the water is good?

A. No, I understand you perfectly. I don't think that that cuts any figure. There is only one way of contaminating the water; it makes it impure and unfit for domestic use whilst these other things do the same thing.

Q. Then it may contain more impurities and yet be free from the stagnated condition and green scum?

A. Yes sir; the appearance of the water has nothing to do with the impurities that it contains.

RE-DIRECT-EXAMINATION.

By Judge Springer.

Q. I presume you have reference to those impurities that come from the presence of pathogenic germs?

A. Yes sir, I have.

Q. Is there any other explanation that you desire to make to the testimony you have given?

MR. JEFFRIES: Objected to as not being proper in redirect examination.

A. Well one thing I might explain, that our water is perhaps not as impure as we imagine.

MR. JEFFRIES: I object to the question and answer.

5863 MR. JEFFRIES: I move to strike out the answer for the reason that the witness has not qualified himself to testify in that respect having made no chemical or bacteriological examination of the water; and has not qualified as an epidemiologist, and for the reason that the question is improper on re-direct examination, and merely suggests to the witness that he is at liberty to inject by way of explanation what counsel for defendants might believe will be argumentative and not based upon material facts shown in evidence, or within the knowledge of the witness.

Q. Now you can go on and explain doctor, your reasons for that conclusion.

A. While we don't use the river water to any extent for drinking or domestic purposes, yet nearly all our ice is harvested from the Illinois river; that is used in and around the city. This ice is used by hundreds of families for drinking purposes, by putting the ice right into the water, and we don't find any bad results arising from that source.

MR. JEFFRIES: I move to strike out the last answer for the same reasons just above given.

RE-CROSS-EXAMINATION,

By Mr. Jeffries.

Q. Doctor, don't you know that a great many physicians
5864 in the towns and cities on the Illinois river in passing
an opinion upon sanitary condition, of the ice cut from the river, have recommended that it should not be put in the water, but should be deposited around the receptacle containing the water?

MR. TODD: I object to the question on the ground that the statement made is not the fact.

A. I understand that there are a few physicians who do recommend that the ice should be packed around the receptacle in which the water is contained.

Q. Don't you know that the ice which is consumed in the towns and cities along the Illinois river, is as a general thing cut from the bays and back-water from the river and from lakes that are supplied by springs and small streams with outlets into the Illinois river, and from estuaries where the water goes through a process of sedimentation?

A. I will have to answer "Yes" to some parts of your question and "No" to some other parts. As to the first part of the question, I don't know about the ice being cut from the lakes and bayous and creeks; all I know is that they cut the ice here from the river; but what they do in other places—

Q. They cut it from what is known as Peoria Lake?

A. Yes sir, Peoria Lake, it is a widening of the Illinois river at this point.

5865 Q. You don't know about the other places?

A. No sir, but so far as sedimentation taking place, at the time the ice is taken, is true to some extent.

Q. The fact that the ice is consumed in that way does not necessarily mean that it contains no pathogenic germs?

A. Oh no, no sir. If there are germs in the water there are bound to be some in the ice.

Q. Do you know the extent of the ice consumption in Peoria?

A. The amount used?

Q. Yes.

A. Thousands and thousands of tons every year.

Q. There is less used in proportion to the population than in many other places by reason of the fact that the people obtain a cool supply of water from these driven wells?

A. I think not.

Q. That has nothing to with it?

A. No sir; I don't think so.

Q. Do you recommend the ice as being good ice?

A. Well I can't say that I have ever objected to the use of the ice on account of these impurities that it contains.

Q. And yet you don't recommend the water?

A. No, as I said a while ago; while we didn't use the water, we do use the ice.

5866 Q. Yes, but how do you reconcile the two recommendations; you recommend the ice and don't recommend the water?

A. Well, yo[illegible]now a good many of our apprehensions are groundless.

L. A. McFADDEN, M. D.

5867 Peoria, Illinois, August 11, 1903.

W. A. McMILLAN,

called as a witness in behalf of the defendants, being first duly sworn by the Commissioner, was examined in chief by Mr. Springer and testified as follows:

Q. Will you state your name, residence and occupation?

A. F. A. McMillan, Peoria, Illinois, at present sanitary officer, health inspector.

Q. How long have you resided in the city of Peoria?

A. It will be twenty years the first day of January now coming.

Q. How long have you held the position which you now hold?

A. I served two years under a former administration. I was off two years and I have been at work about a month this last time.

Q. State the nature of your duties?

A. Well it is to inspect the premises where vaults are above the city ordinance limit;to condemn them and have them cleaned; have anything that is offensive in the way of garbage, have the premises cleaned up and put in a sanitary condition.

5868 Q. In what way is the sewage of the city of Peoria disposed of?

A. Well, through the sewers, where they are connected with the premises—do you mean the garbage?

Q. I mean the garbage and sewage of all kinds?

A. The water goes through the sewers where they are connected, and in some instances they are stored in the yard, and the garbage is hauled away. They generally have a box or can; they have a can that is about the size of a half barrel, and men that haul that stuff away, they come around once or twice or three times a week and haul it away.

Q. Where is this sewage from private vaults, and garbage deposited?

A. Well, it is on this Kickapoo Creek, the lower part of the city.

Q. What becomes of it finally?

A. It is dumped into the deep water of the creek there and finally reaches the river I suppose.

Q. By means of the sewers and the system which you have just described, state whether all the sewage of the inhabitants of Peoria is deposited into the Illinois river?

A. So far as they are on the line of sewers and they have a connection, it reaches the river; but where there is a wash woman, and she throws it on the ground, it simply sinks
5869 in the ground. Peoria being built on sandy ground, it
simply sinks away. Probably in an hour or two you wouldn't see any signs that the woman washed there.

Q. Do you know how many vaults of that kind were cleaned in the city of Peoria for the year 1899?

A. I don't know just the exact number, but I think it was above 600, possibly it would reach over 700.

Q. You may state from any information you have which is reliable, the number of vaults cleaned for the years 1899, 1900, 1901, 1902 and 1903?

A. You want the total amount?

Q. Yes.

A. Well I saw this paper copied from the register from the annual report.

Q. State what those figures are?

A. (referring to paper). They are privy vaults that have been cleaned. In 1899 there were 639;

1900,	725
1901,	700
1902,	735

and so far this year there have been 500 cleaned.

Q. Where were the contents of these vaults deposited, so far as you know?

MR. JEFFRIES: Objected to as a repetition.

5870 A. Part of them were dumped across the river and the
rest were dumped down here on the Dorse dump into the Kickapoo creek.

Q. They went finally into the Illinois river?

A. Yes sir.

CROSS-EXAMINATION,

By Mr. Jeffries.

Q. These vaults and cess-pools that were cleaned from 1899 to 1903 were private vaults, were they?

A. Yes sir.

Q. Do these figures represent the number of vaults cleaned or the number of cleanings, the times cleaned?

A. Those represent the number of vaults cleaned.

Q. For instance, in 1899, you said the number of privy vaults cleaned was 639; do you mean that there were 639 separate and distinct vaults or cess-pool in Peoria that were cleaned that year?

A. Yes sir.

Q. Where a vault was cleaned two or three times a year, was any record kept of the second cleaning?

A. I never knew of but one vault to be cleaned more than once, and it was on top of the bluff up here and it struck a vein
of water and filled up just like a well, and it was con-
5871 demned the second time about a week or ten days after-
wards, and didn't have nothing to haul away but the
water, and there was never any more condemned to my knowledge.

Q. Do you know how many privy vaults and cess-pools there are in Peoria?

A. No sir.

Q. Have you any way of obtaining that information?

A. I don't know unless I could make a distinct canvass for that purpose.

Q. Do you know whether that has been done?

A. I do not.

Q. How many ice plants are there in Peoria, where ice is manufactured?

A. I don't know as there is but one.

Q. Is that a small plant or a large plant?

A. It is the only one I ever saw in my life. I think it is a pretty good sized plant.

Q. Do you know its capacity?

A. No sir.

Q. Does it dispose of its ice here in Peoria?

A. Yes sir.

Q. To the people at their dwellings?

A. Yes sir.

5872 Q. The saloons, hotels, restaurants and other places of that character, obtain their ice from this plant do they?

A. I don't know who they sell it to. Our family took it from them one year, and the rest of the time we have been taking it from this other company.

Q. They sell their ice, do they?

A. Yes sir, they sell their ice.

RE-DIRECT-EXAMINATION,

By Mr. Todd.

Q. Do you know how often the vaults at the Home for the Friendless are cleaned?

A. I do not know.

W. A. McMILLAN.

5873 Peoria, Illinois, Aug. 11, 1903.

EDWARD N. WOODRUFF,

called as a witness in behalf of the defendants, being first duly sworn by the Commissioner, was examined in chief by Mr. Todd and testified as follows:

Q. What is your name?

A. Edward N. Woodruff.

Q. What is your business?

A. I am mayor of the city of Peoria.

Q. How long have you been Mayor of Peoria?

A. Ever since the 5th of May.

Q. What other buisness are you engaged in except looking after the municipal business of Peoria?

A. I am a dealer in natural ice.

Q. By natural ice what do you mean?

A. Well ice that is cut from the river is natural ice.

Q. As distinct from artificial ice?

A. Yes.

Q. How many ice houses do you operate here?

A. Well, we have a capacity of 26,000 tons, divided into three locations along the river.

Q. Where are the three locations?

5874 A. Why above Spring Street, Peoria, here; they are within six blocks, that is from one to the other.

Q. Where do you get the ice which you put up in your ice-houses?

A. Peoria Lake, a widening of the Illinois river is all I suppose.

Q. Is Peoria Lake immediately above Peoria on the Illinois river?

A. Yes.

Q. Lake Peoria is but a widening of the Illinois river, is it not?

A. Yes sir.

Q. How long have you been gathering ice from Lake Peoria?

A. Well I have been in the ice business about 22 years myself; my father started in in 1865.

Q. Your business takes you upon the Illinois river a great deal, does it not?

A. Yes sir.

Q. Are you familiar with the condition of the water of the Illinois river before the opening of the canal and since?

A. Yes sir.

Q. Above and below Peoria?

A. Yes.

5875 Q. What was the condition of the Illinois river water and the Illinois river before the opening of the drainage canal in January, 1900?

A. Well, I—

Q. —as compared with the conditions that exist since the opening of the canal?

A. The water is better than it was. Particularly since the opening of the canal it is better than it was before.

Q. In what respect is it better?

A. Well the water is clearer—well that practically is all—clearer and better condition in every way. I can possibly answer that question better by saying that before the canal was turned in, we were simply figuring on hunting other locations for ice cutting purposes, and I made investigations all through this part of the country where railroad rate was within reason, and wasn't able to find such location and concluded that it would possibly be better to manufacture ice because we felt the time was coming when we would be shut out.

Q. What were the conditions of the water in the Illinois river at that time which led you to look for other places for collecting ice?

A. Well the natural prejudice of the people to begin with; the fact that the river at low water was more or less stagnated in a way; slow current. In winter when the river is 5876 covered with heavy ice there was always more or less odor to the water; particularly at the breaking up of the ice. And from analysis too.

Q. Prior to the opening of the drainage canal, when the ice covered the river and was cut through to the water did any odor emanate from beneath the ice?

A. No, I can't say that it did. It was after the river was covered a long while with ice that this was apparent, and we usually would be through ice cutting you know, in the course of a couple of weeks, so that I don't know as I ever noticed that.

Q. When the river was covered with ice for a considerable period, did you ever observe any effect it had upon the fish in the river, whether they lived or not?

A. No, I don't know; we have had times when there have been a lot of dead fish along the rivers. I have had that matter under discussion but I don't believe the quantity of dead fish that I have observed would warrant attributing it entirely to that.

Q. Since the opening of the drainage canal have you observed that odor under the ice of which you spoke in your previous answer?

A. No sir.

5877 Q. How does the quality of ice since the opening of the drainage canal compare with the quality before the opening of the drainage canal?

A. Well I won't be certain about that, having had an analysis made since the canal has been turned in.

MR. JEFFRIES: I move to strike out the statement of the witness as to the conditions of the water or the ice under an analysis for the reason that he has not testified that he is competent to make an analysis and if such was made, it is not the best of evidence; it is merely hearsay and secondary.

A. (Continuing). What I meant was this, that I meant I had no right to make a comparison by analysis for the reason that I can't recollect having had an analysis made since.

MR. JEFFRIES: I renew my motion to strike out.

Q. I am calling for your opinion as an ice man?

A. The ice is better beyond a question.

Q. Have you had any complaints from those who use the ice since the opening of the canal?

MR. JEFFRIES: Objected to as not competent evidence.

A. The only objection that we have had to the ice is from the soot that grows on the top and in soft weather gets into the ice and feezes there.

Q. How many tons of ice taken from the Illinois river is sold to the consumers in Peoria by you?

5878 A. Last year as near as I can recollect, 19,000 or 20,000 tons.

Q. What class of consumers use your ice?

A. Families and butchers, restaurants and in fact all the people who use ice.

Q. Do you know whether this ice is used for cooling water for drinking purposes?

A. Yes sir, it is. And beer too.

Q. Do you know whether the ice is put into the water that is used for drinking purposes, or kept separate from the water?

A. Well there is no general usage of the ice separate from the water that I know of.

Q. Before the opening of the canal how did the river below the Peoria bridge compare with the river above the Peoria bridge?

A. Well I don't know that I am competent. I have paid very little attention to it below the bridge except that I believe it is good; in fact I know it is good.

Q. Below the bridge the river receives the discharge from the distilleries and the glucose factory and the sewers of Peoria. does it not?

A. Yes sir.

Q. Did you gather ice above the sewers of Peoria?

5879 A. Yes sir.

Q. What in your opinion, is the condition of the river today as compared with the river before the opening of the drainage canal as to the purity of the water?

A. The water is very much better in my opinion.

CROSS-EXAMINATION,

By Mr. Jeffries.

MR. JEFFRIES: I move to strike out all the testimony of this witness for the reason that it is incompetent and immaterial. Incompetent because the witness has not shown proper qualications to render judgment upon the condition of the water from a sanitary standpoint which may be relied upon.

Q. MR. JEFFRIES: How many other ice plants are there that take ice from the Illinois river besides your own, not the artificial; I mean natural ice companies?

A. There are three dealers who sell ice in the city and two St. Louis parties who cut or harvest ice above us.

Q. What I mean is, how many dispose of ice here in Peoria, besides yourself?

A. Two others.

Q. Is there an artificial ice plant here?

A. One, yes.

5880 Q. Do you know the capacity of that plant?

A. No.

Q. Have you a general idea?

A. They claim seventy tons.

Q. Seventy tons a day?

A. Yes. From the information I have, fifty tons is the limit.

Q. Do they dispose of their ice here in Peoria?

A. Certainly.

Q. To the retail trade?

A. Yes.

Q. You are not a chemist nor a bacteriologist?

A. Thank God, no.

Q. And therefore never made an examination of the water?

A. I never did, no.

Q. And when you say the water is better now than it was before the drainage canal was opened, you judge from the appearance of the water?

A. Certainly; I thought that was understood, when I was asked to come here.

Q. Quite a number of people of Peoria don't put this ice that you cut, in the water, do they? They put it in the receptacle, or around the receptacle containing the water?

5881 A. I don't know of a single case where they do it.

Q. You don't deliver ice yourself?

A. No sir.

Q. You don't know then of your own knowledge whether they do or don't put the ice around the recptacle containing the water?

A. Well, I feel that I am in very close touch with the ice business, and I feel I know what is happening in the business, and I don't believe that anyone uses it, and there is no one using it that I know of.

Q. I understood you to say that the water was in very bad condition before the canal was opened?

A. Well it had a murky look, and in comparison with it after the canal was turned in, it was muddy; it was clearer after the canal was turned on.

Q. It made good ice though, before the canal was opened?

A. Oh, yes.

Q. You don't know whether the impurities that were in the water before the canal was opened, are in there now or not do you?

A. No, I couldn't tell by looking at the water, no.

Q. You can't tell whether or not the impurities contained in the water have been increased by the addition of Chicago sewage, can you, except by its appearance?

5882 A. The water is clearer, for the reason that tools dropped in the water at a depth of four and five feet can be discerned and picked up, which could not have been done before the drainage canal was turned in.

Q. That is the only reason that you say the water is better is because of its appearance?

A. Well, seeing is believing.

Q. For certain purposes?

A. Yes.

Q. Do you believe in the theory that disease germs frozen in the ice will die or that the freezing will kill them?

A. Yes sir.

Q. That is the theory upon which you work, and from which you testify in regard to the ice being better than it was before the canal was opened?

MR. TODD: I object to the question on the ground that it is not proper cross-examination, as this witness is not put on the stand as a bacteriologist, or a man learned in germs, and has not qualified as such, and I move to strike out the questions and answers in regard to the subject matter of germs for the reason above stated, unless the witness has qualified as a bacteriologist.

MR. JEFFRIES: In reply to the objection I beg to state that the question is competent of this witness for the 5883 reason that the witness stated in his direct-examination that the water is better since the opening of the drainage canal than it was prior; and this question is competent for the purpose of showing the extent of the information that the witness may have upon the subject, and the reason for stating his belief.

MR. TODD: I move to strike out the statement made by counsel as not proper.

Q. (Question read).

A. Well, vegetation is all dead in the winter, possibly from cold weather; it might seem a reasonable surmise to come at in believing that ice destroys germs.

Q. In other words the fact that the water is clearer than it was before the canal was opened, and the fact that you believe that freezing destroys germs, you pronounce it better ice than it was before the opening of the canal?

A. Yes.

RE-DIRECT-EXAMINATION,

By Mr. Todd.

Q. You have never made any experiments in bacteriology, have you?

A. No.

Q. Do you know as a matter of fact whether it has ever been demonstrated scientifically that germs live or do not
5884 in ice?

MR. JEFFRIES: I object to the question for the reason that the witness has disqualified himself from being able to testify on that proposition on behalf of defendants, who are responsible for his testimony.

A. No, I do not know that fact. In as much as I am able to learn, bacteriologists apparently differ on the question.

Q. JUDGE SPRINGER: Mr. Mayor, I believe you stated that three St. Louis firms have been engaged in taking ice from Peoria lake. Can you name those firms and when they were engaged in taking ice from the Peoria Lake?

A. I said two.

Q. Two then; can you name them?

A. The Muckerman Ice & Coal Company I think is the style of one firm and G. H. Donewald & Company I think are the others.

Q. When was that?

A. Last winter and I don't know how many winters before; a number of winters,—eight or ten or twelve.

Q. To what extent was their cutting and taking of ice from this place, if you know?

A. Combine, 12,000 to 14,000 tons.

Q. Each season—each winter?

A. Well probably every winter they didn't take the ice out; but they held it for reserve.

5885 Q. What would they do with this ice?

A. Ship it away.

Q. Do you know what points it was shipped?

A. I have no knowledge of their billing, except I presume it would all go to St. Louis.

MR. JEFFRIES: We move to strike out all the testimony of this witness on re-direct examination by Judge Springer for the reason that it is incompetent and immaterial, and no proof that the ice so cut by the two parties mentioned therein, having been used by the people of Missouri, St. Louis in particular, or anywhere else, for drinking purposes, or any means by which it could be taken into the human system, and we move to strike out what the witness supposes, assumes or presumes, for the reason that it is no testimony.

Q. JUDGE SPRINGER: Did you learn from either of these firms, or the members of the firms, what they were doing with the ice that they cut from this lake?

MR. JEFFRIES: We object to that question for the reason that the members of the firm are the best witnesses, and their testimony the best evidence, and whatever the members of the firm might have told the witness, would be purely hearsay and not proper.

A. I have had no conversation with either one of the concerns for possibly a year; but I have been told by both of
5886 them that they were making shipments into St. Louis.

E. N. WOODRUFF.

5887 PETER CASEY,

re-called for cross-examination by Mr. Jeffries, testified as follows:

Q. Mr. Casey, in your direct examination this morning you stated the number of cattle fed under your superivision, or that the company had supervision over?

A. Well the cattle were fed by Nelson, Morris & Company, and had no connection with the company; the company merely furnished the slop and the barns to them.

Q. How many cattle did you say were fed from 1895 to 1900?

A. In 1895, I don't know how many; in 1896, I think there was somewhere in the neighborhood of 20,000 head.

Q. That was by the four concerns of which you were manager?

A. Yes, the four distilleries, yes sir.

Q. Was the Corning Distilling Company in business at that time?

A. No sir; the Corning Distilling company commenced operations on the 28th of December, 1901. The Atlas Distillery was in operation at that time.

Q. Do you know how many cattle were fed by these four companies, after you had retired from their supervision?

A. Not exactly; I just know from hearsay, I don't know the exact number; only what they told me.

5888 Q. Then the number of cattle that you testified to as having been fed in 1901, were those that were fed by the Corning Company?

A. No sir, they were fed by the American Spirits Company.

Q. And also in 1902?

A. Yes sir; the Corning Company doesn't feed any cattle. With the exception of within the last month or two, we furnished a little slop to Dodd & Kiefer, just after the Atlas closed down, in order to feed the cattle out for them,—about 1300 or 1400 bushels a day.

Q. At the times that you were superintendent of these four companies—or of these four houses, what other companies were in existence here at Peoria?

A. The Atlas Distillery and Stark Brothers & Company.

Q. Do the Atlas people now, and have they for the last six or eight years, fed cattle?

A. Yes sir.

Q. All the time?

A. Ever since I remember, yes sir.

Q. Do you know how many they fed this year?

A. 2500 head; there may be a few more, but that was the amount of slop they furnished,—2500 bushels.

5889 Q. Do you know how many they fed last year and the year before?

A. I think they fed the same amount; I think they had a contract for five years.

Q. There were more cattle fed here in 1896, than are being fed here now?

A. Yes sir, there haven't been as many cattle fed since 1896 as there was in 1896.

Q. And there were more fed in 1897 than there has been since?

A. Yes, I think it has been decreased right along.

Q. A continual decrease right along every year?

A. Yes.

Q. Now what is the cause of the decrease in the number of cattle fed in the distilleries at Peoria?

A. Well the cause of the decrease in our company was this; when they took in cattle at that time, they had to feed those cattle clear through the season of nine months, whether they had a demand for their goods or not; they had to feed the cattle and store the goods, and for that reason they decreased the number of cattle to keep from storing the goods. They found it was a loss in storing high proof spirits in order to take care of the cattle.

5890 Q. How much corn and grain have been consumed by the distilleries here in Peoria in the last seven or eight years if you know?

A. Well, I haven't got that data; if I had known it would be necessary, I should have gotten it.

Q. Has it increased or decreased?

A. I think there is a slight decrease recently.

Q. In the last year?

A. In the last year or two, yes.

Q. That has been kept by the various companies I presume, the amount consumed?

A. Oh yes, that has been kept—the various companies have an account of each year's mashing. I haven't got it at hand, but the records all show that.

Q. You will get a statement of the amount of grain consumed by the distilling companies of Peoria during the last seven years, and hand it to us?

A. Yes sir.

It is agreed that after the statement is rendered that either side may offer it as evidence if they so desire.

Q. What bcomes of the slop which is not fed to the cattle?

A. It is dried.

5891 Q. Do you utilize it in any way?

A. Oh yes; it demands a very good price for export; it is being used a great deal now for domestic purposes.

Q. What is this slop composed of?

A. It is composed of corn, malt and a very little rye.

Q. When you are not feeding cattle, what is the nature of the material or substance that goes into the sewers and thence into the Illinois river?

A. When we are drying it up; the residue from the presses, when we dry?

Q. At all times from any source outside of the cattle?

A. Well, it is a water that it is hardly perceptible that there is anything in it at all; especially when such fine mash, all the solid is retained—is saved.

Q. What is the character of cattle that you feed and that is fed by the different companies?

A. They are a very good quality of cattle.

Q. You don't feed any diseased cattle?

A. No sir, not if we know it. The only cattle that we ever had here that were quarantined were cattle that came from the Texas district; we had to keep them separate until frost; we never lost a one of them.

Q. They were really not diseased?

A. No sir, they were not diseased at all; they had been
5892 down across that line.

Q. What are the cattle fed upon besides this slop?

A. Hay, cotton-seed hulls and some cotton-seed meal, and I believe lately, they have been feeding them some oil-cake.

Q. Now this offal that runs from the cattle to the river, through the trough, do you know what that is composed of?

A. I don't know exactly the chemical analysis of it; it is ammonia—

Q. In other words it is not treated in any way?

A. It is regular cow manure and urine.

Q. You spoke this morning of a condition of the water in the river being purer since the opening of the canal and in doing so you spoke from your observation of the river and not from any analysis—not from any examination that you made of the water, except from its effects mechanically?

A. From my observation and from its mechanical effects, that's all.

Q. The foaming of the water and the formation of the scale in the boilers was very bad you say at times?

A. The formation of scales?

Q. Yes?

A. No, that had a tendency to loosen up the scale, the deposit we had then.

Q. Before the canal was opened?

5893 A. Yes sir, the water would foam and come clear over the engine; couldn't hold it in the boilers; couldn't find the water line.

Q. You got the water direct from the river?

A. Yes sir, from the river all the time.

Q. It was not bad enough to use a drive well?

A. Well, we couldn't use this well water; there is too much alkali in it.

Q. Do you know whether or not the foaming of the water in the boilers before the canal was opened was caused by the decaying of vegetable matter or animal?

A. Well I think it was both; the water became very stagnant here in the summer—very.

Q. You don't know from any examination that you made that those same impurities are not in the water now, that were then?

A. No sir, we do not. The action is entirely different, is all we go by.

Q. Do you know whether the water in the river is as much polluted now as it was before the canal was opened?

A. I don't think it is; in fact I know it isn't.

Q. But you know only from an observation and for mechanical purposes?

A. That its all, yes sir; otherwise I never made any test.

5894 Q. The current now carries away these impurities that were in the stagnant places?

A. Yes sir, the rapidity of the current.

Q. And it didn't carry it way before?

A . No sir, not in low water.

PETER CASEY.

Whereupon at 5:45 P. M. an adjournment was taken until the following morning, Wednesday, August 12, 1903, at 9 A. M. National Hotel, Peoria, Illinois.

5895 9:00 A. M., Wednesday, August 12, 1903.

Continuation pursuant to adjournment.

Present, the Commissioner and same counsel representing the respective parties.

ROBERT R. MARTIN,

called as a witness in behalf of the defendants being first duly sworn by the Commissioner, was examined in chief by Mr. Todd and testified as follows:

Q. What is your name?

A. Robert R. Martin.

Q. What is your business?

A. Chief Engineer, Peoria Waterworks Company.

Q. Mr. Martin, did you ever take samples of water for the Sanitary District?

A. I did; I had them taken along with myself.

Q. Who took the samples?

A. E. J. Cain and myself.

Q. And where was the water taken from?

A. From the Illinois river, in the channel.

Q. At what point?

A. At the Upper Free Bridge, close to the Upper Free
5896 Bridge.

Q. With reference to Peoria, where is that point that you took the water?

A. Well now, lets, see. It is sort of north—no its southeast of the pumping station of the Peoria Waterworks Company.

Q. Is that at Averyville?

A. Yes sir.

Q. Is Averyville an upper suburb of Peoria?

A. It is an independent corporation of its own.

Q. Above Peoria?

A. Yes sir.

Q. How far from Shady Beach?

A. Adjoining it.

Q. Above or below measuring by the river?

A. It is in Averyville. I can answer that a little better, adjoining the upper free bridge.

Q. Now at what point in the Illinois river at Averyville near the pumping works at the free bridge, was this water taken?

A. In the channel.

Q. How often was it taken?

A. Every day.

Q. In how many places was it taken every day?

A. One place.

Q. When did you first begin to take the water?

A. October 9th, 1901.

5897 At 8:00 a. m.

Q. And continued to take it daily up until when?

A. I think the 29th of December. I have a record of it in the book here; I think it is the 29th.

Q. Did you take any water in 1899?

A. We did.

Q. Will you look at your book and give the exact date that you began taking the water and when you ceased for the different periods that you took water for the Sanitary District?

A. I don't know whether I can refer back to 1899 in the book I have got, and my memory won't allow me to answer that question. I would have to look that up. (Witness refers to book.) I haven't got any record in this book in regard to 1899. I took a good many samples, and some of them I delivered to Mr. Maury.

Q. All the samples that you took, or that were taken under your supervision for the Sanitary District were treated the same way?

A. Yes sir.

Q. And the samples which you took in 1899 were handled by you in the same manner that the samples for 1900 and 1901 were handled?

A. Yes sir.

5898 Q. Will you describe briefly the method pursued by you in the collection of the samples out of the river; the kind of bottles used, where you got the bottles from and how you filled them?

A. When I received a letter from Mr. Maury, instructing me to do what I could if time would permit, for Mr. F. W. Schule. This is my instructions from Mr. Maury, superintendent of the Peoria Waterworks Company (handing counsel paper). The instructions were that the bottles, large one, and two small ones, were to be taken and rinsed out not less than twice with the water that we were to send away for a sample, then the bottles were to be submerged for the purpose of taking

samples. This was done and the samples were taken according to instructions at a certain hour each morning; then delivered, after packing the two small bottles in ice, they were delivered immediately by messenger to Mr. Schule in the Y. M. C. A. building, so that they could be shipped immediately. We had a certain time to get down there so as to make connection with the train. This was all lived up to and I have a record in a book here with all this matter written in. Mr. Cain at that time was working under me for the waterworks company in the capacity of oiler. Him and I have always worked together on these samples. He took most all these samples. Those that he didn't take, I took; but every now and then, very often
5899 I would go down with him to see that he was still living
up to the instructions. He done it; it was not necessary, but in order to see that Mr. Maury's request was lived up to, I done that.

Q. Where did you get the bottles from that you shipped the sample in?

A. From Mr. Schule; then taking the filled bottles down, I brought three back each day. Mr. Schule said they had to be thoroughly sterilized and that is the reason he wanted me to take them back each day.

Q. Where was Mr. Schule's office?

A. In the Y. M. C. A. building, Peoria, Illinois.

Q. You would get the bottles from Mr. Schule and after filling them with water from the Illinois river in the manner heretofore indicated by you, you delivered these bottles back to Mr. Schule and got other bottles to fill and that kept on daily until this work was completed?

A. Yes sir, omitting Sundays.

Q. You took no waters on Sunday?

A. No sir.

Q. After you had filled and packed the bottles in ice, what marks of identification did you place on the bottles?

A. Their size; the size of the bottles were marked.

5900 Q. Did you number the samples?

A. Mr. Schule tended to that.

Q. Did you give him the date and hour of taking?

A. I did, on a slip of paper.

Q. From where taken?

A. Yes sir.

Q. By whom collected?

A. Yes sir, and by whom delivered.

Q. And the height of the water?

A. Yes sir.

Q. Temperature of the water?

A. Yes sir.

Q. Direction of the wind?

A. No sir.

Q. Temperature of the air?

A. Yes sir, and conditions of weather, and the coloration of the water.

Q. This data was handed to him on a paper was it?

A. Yes sir.

Q. With each sample?

A. Yes sir; this coloration of water was taken by a turbidity gauge as he called it.

5901 Q. After this water was packed in ice, who delivered it to him?

A. Myself and Frank Heckenberger, but a day now and then I might have sent someone else along.

Q. But you saw that it was delivered to him in person?

A. I did.

Q. What was his full name?

A. F. W. Schule.

Q. By whom was he introduced to you?

A. By a letter from Mr. D. H. Maury, consulting engineer and superintendent of the Peoria Water Company.

Q. Do you know where he is?

A. I do not.

Q. He was acting for the Sanitary District was he not?

A. As much as I know.

CROSS-EXAMINATION, by Mr. Jeffries.

Q. When did you say you commenced taking these samples?

A. October 9, 1901.

Q. Who was this man that assisted you?

A. E. J. Cain.

5902 Q. Who took the first sample?

A. I did, and showed him how to take them; I took the first three samples in his presence.

Q. This place where you took samples, is that above or below Peoria?

A. Above Peoria.

Q. Did you take any samples below Peoria?

A. I did not.

Q. What kind of an instrument did you use to gather these samples?

A. A regular device for that purpose; I don't know what they call it.

Q. It was a regular machine, was it?

A. Yes, it submerges and pulls the stopper out.

Q. How deep under the surface of the water did you go to get the samples?

A. Oh I should judge a foot and a half to two foot and a half, somewhere near. Sometimes we let her go down deeper.

Q. Did you do that purposely?

A. There was no specified depth given, so we had it well submerged.

Q. How many samples would you take at each place?

A. Took two small bottles and one gallon bottle.

5903 Q. How large was the small bottle?

A. Well, it must have been mighty nigh a quart, I should judge; I never measured them; between a pint and a quart I should judge.

Q. What was the size of the large bottle?

A. About a gallon.

Q. Did you rinse the bottles out before you collected the samples of water?

A. Yes sir, with the water that I took the sample of.

Q. You did that with both the large and the small bottles?

A. Yes sir.

Q. Do you know how long it was after the samples were gathered, before they were shipped?

A. I do not; we were instructed to be on time every morning; if we wasn't there was no use in bringing them down.

Q. Did you wrap the bottles with anything after you gathered the sample?

A. We wrapped a thick duck cloth around the bottle and put a string around it.

Q. Both the large and the small?

A. Yes sir.

Q. Did you pack any ice around them?

A. The small bottles were packed in considerable ice.

5904 Q. You don't know whether the bottles were sterilized or not?

A. No sir, only what I was informed.

Q. You don't know that of your own personal knowledge?

A. No sir, he cautioned me not to take the corks out until we drawed the samples, and he seemed to be very particular in giving me certain bottles back.

MR. TODD: Is this gentleman here (indicating) Mr. Cain?

A. Yes sir, E. J. Cain.

ROBERT R. MARTIN.

5905 E. J. CAIN,

called as a witness in behalf of the defendants, being first duly sworn by the Commissioner, was examined in chief by Mr. Todd and testified as follows:

Q. What is your name?

A. E. J. Cain.

Q. You are the Mr. Cain that it was testified about as assisting Mr. Martin in the collection of the water samples?

A. I am.

Q. You collected these samples of water under his supervision and direction did you not?

A. Yes sir, I did.

Q. You heard him testify here this morning?

A. Yes sir.

Q. Did you comply with the instructions such as he testified about, in the collection of these samples?

A. I did.

Q. And in the handling of these samples after collection?

A. Yes sir.

CROSS-EXAMINATION, by Mr. Jeffries.

Q. What were his instructions to you?

A. To take these bottles to the river and rinse them out 5906 not less than twice and then submerge them and fill them and pack them in ice.

Q. Is that all you did?

A. I a few times delivered them to Mr. Schule at the Y. M. C. A.; that was a very few times though, when Mr. Martin couldn't go I would go. Before they were packed, the stopper was wrapped with a piece of cloth and tied.

Q. You stood on the bank of the river and got the samples?

A. No sir; we didn't stand on the bank; we took a boat and collected them when the weather would permit.

Q. How often did you gather samples?

A. Every day except Sundays.

Q. For how long?

A. From the 9th of October until about the 29th or 30th of December.

E. J. CAIN.

5907

ROBERT R. MARTIN,

re-called for further examination by Mr. Todd, testified as follows:

Q. Mr. Martin, were you acquainted with the Illinois river before and since the opening of the drainage canal?

A. I am for the last fifteen or sixteen years; I have worked along side of it.

Q. Were you acquainted with the water below and above Peoria before the opening of the drainage canal?

A. I am.

Q. What experience and opportunity did you have for observing the water of the Illinois river above Peoria and below Peoria?

A. By pumping it in the city mains.

Q. Were you out on the river a great deal of the time?

A. Well as a fisherman; I am quite a fisherman.

Q. Will you describe the condition of the Illinois river before the opening of the canal and the condition of the Illinois river since the opening of the canal?

A. As I said, I like to go out fishing and I like to eat fish. In the winter time when the river would be froze over here, these fish caught above Peoria, would have a tarrish, gassy taste; so much so that they weren't fit to eat in the 5908 winter after the ice was frozen over for a small time. We have had no time that I could mention this winter but what we have had fish once or twice a week at our house, and they haven't that taste now, where they used to have it before the canal came in; that is my judgment and opinion, we relish the fish as much in winter now as we do in the summer.

Q. What about the condition of the water now as compared with what it was before the opening of the canal?

A. It is clearer.

Q. Before the opening of the canal did the water have any odor in it?

A. It did.

Q. What is the condition now?

A. It is a great deal better.

Q. Do you observe any odor in the water now?

A. I have not.

Q. What in your opinion has been the effect of the drainage canal upon the water of the Illinois river?

A. I think it has given us a better river.

Q. In what way better?

A. Better water; I don't know whether it has any effect on the mosquitoes; in the last few years we have had less mosquitoes up here; I believe that is due to covering over the swamp land, with water; the mosquito part.

CROSS-EXAMINATION, by Mr. Jeffries.

Q. When you say that the water is better now than it was before the canal was opened, do you mean to say that feces and urine and sewage from 1,700,000 people of Chicago, discharged into the Illinois river has improved its condition?

MR. TODD: I object to the question as assuming a fact not proven; there is not 1,700,000 people in Chicago today emptying their sewage into the Chicago river, and for the further reason that the question is misleading, and for another reason, that the question does not assume that there is 250,000 cubic feet of pure Lake Michigan water that dilutes the sewage that is discharged into the Illinois river.

A. I don't know anything about your figures.

Q. You don't know anything about the effect of the sewage discharged from Chicago into the Illinois river, do you, upon the sanitary condition of that water; not its appearance, but on its sanitary condition?

A. I will only say this, that if there is that much corruption coming down there they must give us good corruption for water and fish, for it has made it better. Fish are good to eat now winter and summer. We have fish at our house now positive once every week and almost always twice a week.
5910 We didn't before. We couldn't eat them. They were rotten with this tarrish and gassy taste. In going out fishing, I have taken a drink of this water now when real thirsty; of course I didn't do that because I love any river water, but thirst; but I wouldn't do it before because I knew what it was. I pumped it at the old pumping station and I saw enough. I only mean in winter time now when I am speaking about the condition of the fish, when the ice was froze over, before, I meant.

Q. The fish didn't taste bad in the summer time?

A. They were all right in the summer when they have plenty of air.

Q. When you say the water is better you judge simply from its appearance?

A. Well I drank it.

Q. Without any reference to the properties it might contain?

A. Only the properties and use of it, and sight.

Q. Are you engaged in the fish business?

A. No sir, I am not.

Q. Are you out on the river every day?

A. Well, I am around the river all the time. I have charge of about 450 feet altogether, river frontage; part of it is used for park purposes which is under my supervision. If I
5911 said 450 feet, I should have said 4,500 feet.

Q. You don't drink the water very often?

A. I drink it altogether—that is, what water do you mean now?

Q. I mean the water from the river?

A. Oh no. I didn't know what you did mean, but I drink water altogether.

Q. You are working at the water supply pump works of the city?

A. Chief engineer, yes sir; fifteen years' experience.

Q. How deep is the well from which they get their water?

A. One part is 51 feet from the surface, and the other—four caissons that goes beyond that; I think they run down about 26 feet further; to what is called hardpan.

Q. How far are those pumps or wells located from the river?

A. Well, that depends upon the elevation.

Q. I mean how far are they located from the river, on the bank?

A. You mean at high water mark or low water mark?

Q. At ordinary stage?

A. Without measuring it I should say anyway from an average of 350 feet to 450 feet.

Q. What is the character of the soil?

5912 A. It is what we call a loam and then a gumbo; water will not penetrate it. It is better than clay for a bank; I am talking from experience now.

Q. What is there below the gumbo?

A. Then comes the gravel and the clay.

Q. Do you know the direction from which the water comes that runs into those wells?

A. It seems to come from the north; I saw the stream; the effects of the stream comes from the north.

Q. Opposite from the river?

A. More east than north, yes sir.

Q. Then it seems to be running under the surface of the earth towards the river?

A. Yes sir.

Q. And not from the river?

A. No sir.

Q. To what extent is that water in those wells used by the people in Peoria?

A. For general use.

Q. What is your average daily pumping the year around?

A. I couldn't answer that without figuring it out. In real cold winter, when they let the faucets run, there is an increase, real wet time when there is no sprinkling, no freezing, the consumption decreases; in the middle of the summer 5913 when there is heavy sprinkling it increases; it varies; I will have to refer you to the books for that question.

Q. Well, can't you approximate it?

A. I don't want to answer that question without referring to the books. I make my daily reports to the office; you can get that from them.

Q. You make a report daily of the number of gallons pumped that day?

A. Everything; coal consumption; elevation of river, elevation of well, and all those you will find in the water company's office.

Q. How long have you been making that report?

A. All the time during my service.

Q. Now from those reports, what would you consider an average day's pumping?

A. Well, I wouldn't want to answer that.

Q. Well, I want your opinion?

A. Well, an average of from four to six million gallons a day for the last two years.

Q. You don't know how many private wells there are in Peoria do you?

A. No, I don't.

Q. I understood you to say that before the opening of the 5914 canal there was nothing wrong with the fish in the summer time. That was right, wasn't it?

A. Yes sir.

Q. And that the only time that they were in bad condition was when the river was frozen over?

A. Yes sir.

ROBERT R. MARTIN.

5915 CHARLES F. HIXSON,

called as a witness in behalf of the defendants, being first duly sworn by the Commissioner, was examined in chief by Judge Johns, and testified as follows:

Q. State your name, residence and occupation?

A. Charles F. Hixson; 605 Pennsylvania Avenue, Peoria, Illinois; my occupation is I run a summer resort and boat yard near the upper free bridge.

Q. Is that at or near a place called Shady Beach?

A. That's what we call it, Shady Beach.

Q. How long have you been engaged in that occupation at that place?

A. Eight years.

Q. Where is Shady Beach with reference to the city of Peoria, above or below?

A. It is about three miles and a half above Main Street.

Q. Do you know a place on the Illinois river called the Narrows?

A. Yes sir, we are right at the Narrows.

Q. Is there a part of the Illinois river above the Narrows called Peoria Lake?

5916 A. It is below the Narrows.

Q. What is the fact above the Narrows, is there an enlargement of the river there called a lake?

A. Yes sir, there is quite an enlargement above the Narrows.

Q. What is that enlargement called?

A. Well, it runs into Hooshaw's Slough. I never heard any particular name for the lake; simply the widening of the river where it goes into Hooshaw's Slough.

Q. What is the extent of that upper enlargement? How wide is it and how long?

A. Oh, it is probably three-quarters of a mile wide at an ordinary stage of the water and probably a mile and a half long; then we go into what we call Buffalo Bend, another widening place.

Q. How far above the place called Hooshaw's Slough, is Buffalo Bend?

A. About a mile and a half I should judge; possibly not more than a mile.

Q. What is the extent of that enlargement?

A. Well, it would probably be three-quarters of a mile each way.

Q. Are these two bodies sometimes designated as the Upper Lakes?

A. I presume so.

5917 Q. What was the condition of the Illinois river above the place called the Narrows prior to the opening of the drainage canal?

A. Well, before the opening of the canal in the summer time, when the water was very low, the water became very foul and had a very bad odor to it, and there would come a very heavy green scum through the months of July and August particularly; a man get up in the morning there at four o'clock or daylight, the odor that came from the river was something fearful.

Q. Do you know anything of its effect upon the fish?

A. Well, in the winter time, the fish when the river was froze over wasn't fit to eat; they had a peculiar tarrish, gassy taste; we couldn't eat them; lots of them would die. In the spring when the ice would break up you would see thousands and millions of dead fish floating in the river.

Q. Since the opening of the drainage canal, what has been the condition of the river above the Narrows?

A. It has been very much better; we have had a higher stage of water. The water has been purer to the naked eye, and clearer; and we haven't had that odor coming from the river that we had prior.

Q. And as to the fish?

A. We have had no trouble in regard to the fish since.

5918 Q. Were you engaged at any time in taking samples of water here at Peoria?

A. I was engaged in taking samples of water at my place, Shady Beach, along the Narrows.

Q. Who engaged you?

A. Mr. Jacob Harman.

Q. Under whose directions were you acting?

A. Under Mr. Long's, I don't know what capacity he has exactly; he is something under the state department.

Q. Were you acquainted with Prof. Long?

A. I don't remember that I ever met him.

Q. If you were instructed by any person as to the manner of taking these samples, you may state by whom?

A. By Mr. Long by letter, and Mr. Harman, I think; but I think I got my instructions direct from Mr. Long, printed instructions.

Q. Did you take the samples the same way each time?

A. Yes sir, as near as we could.

Q. Describe the manner of taking the samples and the preparation of them for shipping and the shipping?

A. Well, as near as I can remember now, they furnished us with a thermometer and we took the temperature of the air and of the water before we took the samples. Then we took a boat to the center of the river and there we sunk the bottles as 5919 far as we could underneath, and until they were full.

There was a large bottle which would hold a gallon or better, and a small bottle that probably wouldn't hold more than any place from a half a pint to a pint. The small bottle we packed in ice. We first put it into a small tin can and then packed ice around that. In the first place we sealed each one of those bottles, by tying a canvas cloth over them and tying a string over that, and then we sealed with a wax seal; sealed them and put our stamp on it which we were furnished by them, and my recollection is that we packed both—packed the ice in the big bottle; I ain't sure about that, but we packed I know, the small can in ice and put it in the big box, then we packed excelsior around the big bottle; but we didn't use any ice only around the tin can that contained the small bottle; it took quite a little of cracked ice to fill that can. We filled that can full of cracked ice after the bottle was put in, and the express left here in the afternoon some four or five o'clock, and we had arrangements made that the express company picked it up at a little confectionary opposite the Avery Planter Company. In case we missed that, we took it to the express office ourselves.

Q. How long a time would elapse from the time of the taking of the sample until it was delivered to the express company?

5920 A. Not to exceed an hour.

Q. What did you do with reference to putting a tag or label on these bottles?

A. We had printed labels that we put on; we put on the date and the temperature and the condition of the weather and the condition of the storms just prior to, and so forth. It was put in an envelope and tied onto the bottle.

Q. Was this card for which you made this memoranda signed by you?

A. Yes sir.

Q. And then put in an envelope?

A. And then put in an envelope.

Q. Tied to the bottle?

A. Tied to the bottle.

Q. During how many seasons or parts of seasons in different years, did you take these samples?

A. I ain't sure whether it was two or three.

Q. Did you take any before the opening of the drainage canal in January, 1900?

A. Well, in my mind I did, but I ain't positive about it.

Q. How frequently did you take samples?

A. Well there was a part of the time that we took twice and part of the time three times a week and part of the time only once a week.

5921 Q. Were the samples each season taken in the same way?

A. Just exactly, as near as I can remember.

Q. At what points were they taken, as nearly as you can tell?

A. Well, right opposite the beach, or probably we would go from the beach out to the center of the river and by the time we had taken the samples we would almost be under the bridge, or close to the bridge; the current would carry us down.

Q. Where is this bridge with reference to the sewers of Peoria, above or below?

A. Well, I don't think there is any sewers that empty into the river closer possibly than a mile or a mile and a half below the bridge, of the city sewers.

Q. With reference to that part of the river called the Narrows, where were these samples taken?

A. Right at the Narrows; the narrows formed in the Illinois river.

CROSS-EXAMINATION, by Mr. Jeffries.

Q. How long have you lived here in Peoria?

A. I have lived in Peoria most of the time for twenty-odd years.

Q. How long have you been engaged in your present business?

5922 A. About eight years.

Q. Before the canal was opened the water in the river at this point was stagnant at this time of the year, was it not?

A. Yes sir, very low.

Q. How is it now?

A. It is much better.

Q. There is a good current?

A. There is a good current and there isn't the odor that there was before.

Q. There is some odor?

A. Very little that you can detect.

Q. You never had any water analyzed?

A. That is, I suppose the water that I sent to Chicago was analyzed.

Q. But on your own account?

A. No sir.

Q. You don't know whether it contains injurious materials or not?

A. Not anything more than just as you see it going down.

Q. These samples that you took; did you take them yourself?

A. Not always; I had two men working for me, and sometimes they would go out in the river and get them and sometimes I would go out with them and get them. I was there when they were taken, I think, all of them, or possibly once may be or twice that I may have been absent when they were taken.

5923 Q. How many times did you personally take the samples?

A. Oh, I couldn't tell you. I generally went with them and either rowed the boat, but generally they rowed the boat and I took the water.

CHAS. F. HIXSON.

5924 **WILLIAM BAKER,**

called as a witness in behalf of the defendants, being first duly sworn by the Commissioner, was examined in chief by Judge Johns and testified as follows:

Q. State your name, residence and occupation?

A. William Baker; Peoria, Illinois, is my present residence. I am agent for the State Board Live Stock, or inspector, at the Union Stock Yards, Peoria, Illinois.

Q. How long have you occupied that position?

A. A year the first of September.

Q. What are your duties as inspector under the State Board of Health?

A. I have general supervision of the stock on foot that passes through the yards.

Q. Do you inspect some of the stock that is fed here by the distilleries?

A. Well, I can't say officially; that stock does not go through the stock yards as a rule.

Q. Where are the Peoria stock yards?

A. They are located at the foot of South Street, and the river.

5925 Q. How near the river?

A. Probably two or three blocks.

Q. What is the extent or area of the yards?

A. Well, they cover probably six blocks or thereabouts.

Q. Stated in acres how much?

A. I couldn't say as to the acreage.

Q. Can you state its approximate length and width, the dimensions in feet?

A. I would say that it would probably cover over an acre, the yards proper and their belongings, you know.

Q. That's what I mean.

A. Before I was speaking of the yards and pens.

Q. What is the length of the entire stock yards say east and west, in feet?

A. Probably—I would say they were two blocks wide and about four long; that is as near as I can get at it.

Q. We know nothing about the size of blocks here. Are they 1,000 feet wide and 3,000 feet long?

A. I would say they were, to the best of my ability.

Q. How are the yards proper constructed, with reference to pens, etc.?

A. Well, they have their divisions for cattle and others for hogs and sheep, laid out for convenience.

5926 Q. Are the pens floored, or right on the ground?

A. Well, the hog division is floored with wooden floors.

Q. What kind of animals are received in this yard?

A. Well, hogs, cattle and sheep.

Q. How many hogs are received there in the course of a year?

A. Well, that would be hard for me to state; not even close, I couldn't. I coudn't even give you anything that would be of benefit to you as a rough estimation.

Q. Well, that's what I want?

A. Hogs and cattle?

Q. Yes. A rough estimation.

A. I would say 6,000 hogs a week and from 300 to 600 cattle, and probably 100 sheep.

Q. What is done with the manure and urine from these animals while they are confined in the stock yards?

A. Well, each pen has a sewerage, or catch basin, and of course what is carried off in them and what is not is hauled out of the pens; the pens are cleaned of offals of different kinds.

Q. The materials which the catch basins receive, where does it go?

A. It passes into the sewers.

Q. Does it go from the sewers into the Illinois river?

A. Yes sir, to the best of my ability; they have a sewerage system in the yards that connects this with the city sewers. 5927

Q. Does this sewage eventually, through the sewers, get into the Illinois river?

A. Yes sir.

Q. What becomes of the material that is hauled away from these pens?

A. The greater part of it is hauled below, or near around the river bank.

Q. Is it washed off afterwards by high water, into the Illinois river?

A. To a certain extent, some of it.

Q. What becomes of the balance of it?

A. Well, it fills in a low portion of the ground that is located there.

Q. If rains or floods come into this low portion, does the water go from that into the Illinois river?

A. Well, part of it is dumped—on this side of the C. R. I. & P. Railroad track a part of it is dumped in the river and a part of it is dumped on the river bank.

Q. What becomes of the water flood that gets into this material which is dumped; does that finally go into the Illinois river?

A. I am not positive of there being any outlet to the embankment of the railroad, so that the seepage could get 5928 into the river; but the seepage of that would naturally have to pass into the Illinois river.

CROSS-EXAMINATION, by Mr. Jeffries.

Q. What seepage do you have reference to?

A. Well the general dumping of the offals, which are hauled from the pens.

Q. How far did you say that is from the river?

A. The yards proper?

Q. No, the dumping ground?

A. Well, the C. R. I. & P. Railroad runs on the immediate bank of the river, and they dump some on the river side and some on the land side of the railroad embankment.

Q. Do you know the amount of offal that is carted away and dumped as you have stated?

A. Well, there is one team, I would say, hauling all the time.

Q. What is the character of the cattle, sheep and hogs that pass through the stock yards here?

A. You mean what quality?

Q. Yes.

A. Well, it is mostly cow-stuff and a great deal of through cattle that are unloaded here for resting and watering purposes.

5929 Q. What do you feed them?

A. Corn and hay. That is, speaking of the yards.

Q. Are the yards located above or below the city?

A. Below; that is in the 2100 block.

Q. And how far from the bank of the river?

A. Probably a thousand feet.

Q. About a quarter of a mile?

A. No.

Q. How many cattle did you say you run through the pens here a week?

A. From three to six hundred.

Q. And hogs?

A. About six thousand.

Q. And sheep?

A. About a hundred.

Q. They are not slaughtered here?

A. We have slaughtering houses here; they slaughter quite a good deal; principally cow-stuff, that are received. A great many cattle fed here at the distilleries.

Q. Is the number of cattle handled at the stock yards increasing or decreasing?

A. Well, I think it holds its average.

Q. How is it with reference to hogs and sheep?

A. About the same.

WM. BAKER.

930 PERCY M. SWAIN,

called as a witness in behalf of the defendants, being first duly sworn by the Commissioner, was examined in chief by Mr. Todd and testified as follows:

Q. What is your name?

A. Percy M. Swain.

Q. What is your business?

A. Captain of the Steamer Fred Swain, plying between here and LaSalle.

Q. How long have been captain of the Fred Swain?

A. Since 1900.

Q. Prior to that time what was your business?

A. I was captain of the steamer Borealis West, on the same run.

Q. How long were you captain of that boat?

A. Since 1892.

Q. What business is the Fred Swain engaged in?

A. General freight and passenger business.

Q. It runs between Peoria and Peru?

A. Yes sir.

5931 Q. How often does it make the trip?

A. Why we make a trip every day to Hennepin now and every other day to Peru, but prior to this season we made the round trip from here to Peru every day, Sundays included.

Q. For how many years have you been a captain of a boat making the trip between here and Hennepin?

A. Since 1892.

Q. How far is it from here to LaSalle or Peru?

A. Why the Government survey gives LaSalle 72 miles and Peru 71.

Q. How far is it from Peru to Chillicothe?

A. About fifty miles.

Q. How far from Peru to Lacon? I mean from Peoria to Lacon?

A. Thirty-two and a fraction, I think.

Q. How far to Averyville from Peoria?

A. I should judge about two miles.

Q. How far from Peoria to Chillicothe?

A. 21 miles.

Q. How far from Peoria to Henry?

A. Between 40 and 41—forty and a fraction I think; I don't know just exactly; it is almost forty-one.

Q. Will you describe the condition of the river before the opening of the drainage canal in 1900?

5932 A. Well, prior to the turning in of the drainage there was very little current and there was a green scum formed on the river, and the water was not clear; the water had the appearance more of a kind of—in the lake here, a kind of a white appearance, more like sewage color you know; and in places, for instance the locks there, it had this greenness, it would also form on the gates and also formed on the boat and this kind of a white stuff, and a considerable odor came from the water. For instance Lacon, where there wasn't much of a current, there would be an odor there, and also at the locks.

Q. Did you observe how fish were affected?

A. Well, in the winter time when the river was frozen over there was more or less dead fish, and where they took up the nets in fishing, there was more or less odor, more than there is since the turning in of the drainage. The river is altogether different now than it was prior to the turning in of the drainage.

Q. In what way does it differ, Captain?

A. Well, it is clearer, and this green scum doesn't form any more, only in places like for instance, Lake Depew, or for instance the Illinois river where there is no current; that would be in eddies, you know.

Q. What is the condition of the water since the opening

5933 of the canal?

A. Why, heretofore it was necessary to clean the boilers once a week, every week, but of late once in two weeks is sufficient. We didn't have such accumulations in the boilers of—I don't know what substance you call it. One time we laid at Peru and started in the morning to clean out the boilers, and we had so much of that stuff accumulated in the pipes, we had to take it apart, and by the time we got the boilers cleaned out and washed up, it was so late we lost a trip.

Q. Before the opening of the canal did you fill any buckets on the boat with water from the river?

A. Yes sir, for fire purposes. We found a difference of late. Of course it evaporates as much at a time, but there isn't so much of this greasy appearance around the edge of the buckets as there was heretofore.

Q. How about the clearness of the water?

A. Oh, the water is clear; lots of time you can see right down to the bottom; prior to the drainage canal you couldn't see to the bottom of the river at any place at all. At times when there is no raise or extra current, you can see down three or four feet. At Peru the boys lost a wrench overboard and there must have been four feet of water or more—and got it
out, and heretofore it never was clear enough to see the
5934 bottom any place.

Q. What in your opinion has been the effect upon the condition of the water in the Illinois river by the opening of the drainage canal?

A. Well, the condition of the water is better. There is more or less current and this green slime doesn't form any more on the river; it is a good deal clearer and better in every way.

Q. Are you acquainted with the Illinois river immediately below the landing at Peoria?

A. Yes sir, about down to—well as far down as the stock yards. We don't go down below Pekin or Copperas Creek more than once or twice a season, but we go down to the stock yards every week and sometimes two or three times a week.

Q. Have you been down to the stock yards recently?

A. I was down yesterday.

Q. Do you observe any difference in the water above the Peoria Bridge from the condition below the Peoria bridge?

A. Why, above the bridge, the water is considerably different from the water below the bridge. Below the bridge where it gets the sewage from the stock yards and packing houses, it is a thick, heavy, mushy appearance. Two or three hundred feet from land you can see this stuff bubble up before
you are within two or three hundred feet of the shore.
5935 You see the bubbling up, this stuff raises up in the bot-
tom that way, a black appearance, an awful appearance; but we always stop the pumps before getting in there, to keep from pumping this stuff into the boiler and causing a stoppage

of the pipes, and it has a kind of a rotten smell coming off of it, or odor, a kind of a rotten smell like.

Q. What causes this, Captain?

A. Why, I suppose the turning in of those distilleries and cattle pens and packing houses; that stuff accumulates there, that thick refuse.

MR. JEFFRIES: We object to what the witness supposes is the cause and move to strike out that part of the answer.

Q. Can you see this sewage entering into the river as you pass up?

A. Why, you can at times, yes, coming out of those runs along there.

Q. Is this a matter of supposition with you or a matter of knowledge?

A. Why, it is a matter of knowledge, I have been there and seen it.

Q. How many distilleries along the river there?

A. Why I don't know as to that; I never counted and I don't know how many are in operation, I am sure. Some seem to be idle and others in operation. I couldn't say.

5936 Q. About how many have you observed along the river?

A. Well, there is a sugar refinery there. Only this one distillery that I am positive is in operation.

Q. Is there a glucose factory along the river there, or sugar refinery?

A. Well, I think—

MR. JEFFRIES: I object to what the witness thinks; unless he knows, I object to it.

A. I don't know whether there is or not.

Q. Are there any slaughter houses along the river?

A. There is two packing houses there.

Q. What are their names?

A. Peoria Packing and Provision Company and E. Goden & Sons.

Q. Do you carry freight from those places?

A. Why, yes; they bring it to us; we carry their produce up the river.

Q. How does the river above Peoria bridge compare with the river below, at this time?

A. Why, the river above the bridge is clearer. Below these stock yards and still houses, it is very sluggish and as I said before it has this odor coming from it; it is filled up.

5937 CROSS-EXAMINATION, by Mr. Jeffries.

Q. Are you an engineer, Captain?

A. Yes sir. I haven't done anything else except work around a machine shop and on a steamboat.

Q. The volume of water and the current of the Illinois river is much greater now than it was prior to the opening of the Chicago drainage canal is it not?

A. Yes sir.

Q. From Peoria to LaSalle there was very little current before the canal was opened?

A. Yes sir, very little current.

Q. How is it now?

A. Well, there is considerable more current. Of course we haven't been able just exactly to tell how much current, but we notice in the landing. Heretofore when the wind was blowing up stream we generally always had to take out a line to keep in the wind. Now we don't have to practice that as the current has an effect on the boat and has a tendency to hold her. At Peru, the current is stronger there than anywhere; we notice it more there than anywhere.

Q. Well, there is some green scum forms on the river yet, doesn't there?

A. Well, where the water is dead, where there is no cur-
5938 rent; and in the eddies and up in the sloughs. I notice
when the wind blows off from the direction of those sloughs, it comes out into the river.

Q. You don't know but what the same impurities or the same character of impurities which formed the green scum prior to the opening of the canal is yet in the water, do you?

A. Well, this scum, I suppose forms only where there was no current, or where there was very little current. We haven't seen any on the river only where it came out of these sloughs or bayous.

Q. So that since the opening of the canal it either doesn't form or else it is carried down the river by the current?

A. Well, I always believed that it formed when there wasn't any current, when it was stagnant. I know that before the turning in of this drainage, if we had a very hard wind blowing from the south up-stream, it would raise the water. For instance at Henry or Lacon, but it hasn't in the last few years since the drainage has been in. No wind blows hard enough up-stream to raise the water.

Q. You don't know anything about the sanitary condition of the water?

A. Well, the water is considerably clearer and that odor doesn't come from the water as it did before, and we don't get this slime.

5939 Q. You don't know anything about the particular elements or ingredients that are in the water, do you?

A. No sir.

Q. You don't know what effect the discharge of the Chicago sewage into the Illinois river through the canal, has had upon the sanitary condition of the water?

A. Well, only that the water has been more or less purer than it was heretofore.

Q. What do you mean by "more or less"?

A. Why, where there is a considerable current, the water will naturally purify itself in going a certain distance, would it not? Where there was no current heretofore, the water would be stagnant and it wouldn't purify itself so much.

Q. Well then at times since the opening of the canal there would be less impurities and at other times more impurities; do I understand you to mean that?

A. Well, there would be less impurities now than there was heretofore.

Q. And at times more?

A. No, I wouldn't think there would be any more. Well, there would be, yes, when the water was 21 feet on this Peoria gauge here, and there was a current of five or six miles an hour at Peru, the water would be more pure than it is now when there isn't so much current, and the water is down within
5940 the banks.

Q. The reason you say the water is better now than it was before the canal was opened, is based upon the fact that there is more current, a larger volume of water, and its appearance clearer, and more volume of water, than there was before the opening of the canal as I understand you?

A. Yes sir.

Q. And your idea of pure water is clear water?

A. Well, yes.

Q. That is clear to the eye?

A. Yes sir, I think this water when it is so clear you could see down through it would be purer than when it was so sluggish that you could just see that it was water.

Q. You have seen the water coming from the sewers, perfectly clear, have you not?

A. Well, I don't know as I have.

Q. Don't you know that you have?

A. I don't know that I have; the water that comes in from the sewers down there where we are is not clear; it has a whitish appearance. Of course there are sewers where waterworks —the water possibly, just where there is a closet or something like that, might be clear, but I never paid any attention; but the sewers that we come in contact with are city sewers
5941 here around the landing.

Q. Don't you know that water might be perfectly clear to the eye and yet contain disease germs and poison that would get into the human system?

A. Yes sir.

Q. Then not having made an examination of the water of the Illinois river, you don't know what effect the Chicago sewage has had upon that water from a sanitary standpoint?

A. No, I don't know what effect; only as I said before.

Q. Do you own any interest in that steamboat that you are captain of?

A. Yes sir.

Q. Boating is much better now than it was before the canal was opened?

A. Oh, you mean the stage of water?

Q. Stage of water?

A. Yes sir. PERCY M. SWAIN.

5942 Whereupon an adjournment was taken until 2:00 p. m. same day, Wednesday, August 12, 1903, at same place.

5943 National Hotel, Peoria, Illinois. 2:00 p. m., Wednesday, August 12, 1903. Continuation pursuant to adjournment.

Present, the Commissioner and same counsel representing the respective parties.

ALEXANDER RICHARDSON, called as a witness in behalf of the defendants, being first duly sworn by the Commissioner, was examined in chief by Judge Johns and testified as follows:

Q. State your name, residence and occupation?

A. Alexander Richardson; residence, Peoria, Illinois; house number 512 Fifth avenue.

Q. Are you now retired from business?

A. Well, no; I never expect to be retired; I shall always do something.

Q. What was your occupation?

A. I have been in the jewelry business for a number of years, and my trade was an engraver.

Q. How long have you lived in Peoria?

A. I have lived in Peoria for over thirty years.

5944 Q. If you have fished and hunted on the Illinois river you may state for what period of time and within what limits?

A. Well, I have fished for thirty years, annually, and hunted for fifteen to twenty.

Q. Have you fished with nets or hook and line?

A. Hook and line.

Q. How far from Peoria in each direction up and down the river, have you fished and hunted?

A. Oh, I have fished up and down the river for fifteen to eighteen miles.

Q. Do you own a launch or boat upon the river?

A. No, sir.

Q. How has your fishing and hunting been conducted, by boat?

A. By boat, skiff, small skiff, and then I have had them taken down on these steam tugs, or else tied on the tugs and taken down by the tugs or steam launch.

Q. What was the condition of the water in the Illinois river above Peoria before the opening of the drainage canal in January, 1900?

A. The condition of the water was very bad, extremely bad, in my opinion.

Q. In what respect?

A. Well, the water was very low at certain seasons of the
year,—summer, for instance, in the first place, and at
5945 some points it was covered with a green scum clear across,
and at some places near the city, up above the city, you
could smell it here, a very bad odor.

Q. Are you familiar with a plant that grows in the water here ordinarily termed duck-weed or water-clover?

A. Well, I have understood what it was; I have seen it and they called it duck-weed or water-clover.

Q. Was this scum upon the river which you noticed duck-weed or was it some other substance?

A. Well, at times I would notice it, apparently it would be a very small green seed floating on the water; at other times, most of the times, it was apparently a green scum on the water. I couldn't say positively what that was.

Q. Describe the odor as you noticed it?

A. Well, I don't presume I could describe it any better than to say it was very obnoxious, disagreeable, bad smell.

Q. Did you notice the quality of the fish at any time prior to the opening of the canal?

A. Yes, sir, I have.

Q. What was their condition?

A. Well, the fish that I caught and that others caught,
unless they were caught back in the sloughs where those numerous springs come down from the bluffs there; unless we caught
the fish around them springs, we couldn't eat them at all;
5946 they were very soft; but those that we caught near the
springs, were all right.

Q. What was the condition of the water of the Illinois river below Peoria, before the opening of the drainage canal?

A. Well, there is no doubt but that the water was always very bad below Peoria, that is below the stills at Peoria, for a number of miles.

Q. As compared with the water above Peoria, how was it below?

A. Well, it was bad above and a good deal worse below.

Q. Was there an odor to the water below the city?

A. Yes, sir.

Q. Did the scum form upon the river below the city?

A. Yes, sir.

Q. Since the opening of the drainage canal, in January, 1900, what has been the condition of the water in the Illinois river above Peoria?

A. Well, it is virtually a new stream you may say; it is so much improved. There has been so much larger volume of water and so much greater current, that we find that the water is purer, colder and better in every way.

Q. Has it now an odor above Peoria?

A. Not that I can detect, any more than the smell that any river has.

5947 Q. Does this green scum form on the river above Peoria now?

A. I haven't seen any as yet since the opening of the canal and the lake water coming down here.

Q. What is the condition of the water in the Illinois river below Peoria since the opening of the canal?

A. Well, it is like it was above; it is wonderfully improved. I might add that it is not what it ought to be, on account of the refuse from the distilleries.

Q. Is there still an odor in the water below Peoria?

A. Why, I think on real hot days I have noticed it, yes, sir. Oh, yes.

Q. How much have you hunted and fished on the river since the opening of the drainage canal?

A. Why, I have gone more or less every year during the hunting season and the fishing season; I go probably every two weeks, two or three days. Sometimes I go every week fishing, for one or two days.

BY JUDGE SPRINGER: Q. Have you noticed any difference in the quality of the fish since the opening of the canal as compared with those that you caught before that?

A. Yes, sir, I have.

5948 Q. What was that difference?

A. Well, the fish are harder and firmer and of a better flavor, and since the opening of the canal and the coming in of the water we catch larger fish, such as bass and pike, which we didn't catch before.

CROSS-EXAMINATION, by Mr. Jeffries.

Q. What is the principal fish caught in the Illinois river by the fishermen?

A. Carp.

Q. Carp is the most abundant fish in the river?

A. It is just now.

Q. And has been?

A. Well, since the government planted them here three or four years ago; previous to that time carp was unknown.

Q. Carp is a scavenger fish, is it not?

A. Well, that is a matter that none of us fellows here know, whether they are or not. I find that they won't bite on any fresh bait, such as minnows and worms, or liver or meat.

Q. That they won't bite on worms?

A. Oh, occasionally, if one was real ravenous, we catch one occasionally.

5949 Q. You say there is a greater volume of water since the canal was opened?

A. Oh, yes, sir.

Q. And the channel or current of the river is very much faster since?

A. Oh, yes; yes, sir.

Q. You say you have examined the river here at this point in years past?

A. No, sir; I never examined it.

Q. You don't know anything about the sanitary condition of the river?

A. Not from analyzing it, I don't, but I know otherwise.

Q. Well, you know from its appearance?

A. Well, I know from its appearance and its smell, both.

Q. Well, the reason that there is no smell in there now is that there is a larger volume of water and more current?

A. That is right.

Q. Those same impurities are doubtless there?

A. Well, that may be.

Q. And carried away?

A. That may be.

Q. Or there may be more impurities there?

A. There may be.

5950 Q. The fishing industry is quite extensive here, is it not?

A. Yes, sir.

Q. And has been for a number of years past?

A. Yes, sir.

Q. Do you know whether the discharges from these distilleries here is decreasing or increasing?

A. I really don't know anything about that.

ALEXANDER RICHARDSON.

5951 MICHAEL D. HURLEY, called as a witness in behalf of the defendants, being first duly sworn by the Commissioner, was examined in chief by Mr. Todd and testified as follows:

Q. What is your name?

A. Michael D. Hurley.

Q. Where do you live?

A. Peoria, Illinois.

Q. What is your business?

A. Just now I am doing special work for the fish commission.

Q. How long have you been engaged by the fish commission?

A. About a month or two.

Q. What was your business before that?

A. Captain of police for two years.

Q. In Peoria?

A. Yes, Peoria.

Q. What was your business before becoming captain of police?

A. Wholesale fish dealer.

Q. How long were you in the fish business?

A. About seven years; close to that.

Q. Are you acquainted with the Illinois river?

A. I am.

5952 Q. What points on the Illinois river are you acquainted with?

A. Pretty generally the whole river, but particularly from Havana to Henry, during the time I was in the fish business.

Q. When you were in the fish business did you catch any fish yourself for sale?

A. I assisted on several occasions.

Q. Did you have men hired to do the fishing for you?

A. Yes, sir.

Q. How many men did you have?

A. On the fishing crew and market between fifteen and seventeen usually.

Q. How did they catch the fish?

A. With what is known as fyke nets and seines.

Q. How much time would you spend on the river?

A. All my time during the day. There was occasional off days, perhaps I wasn't off the river more than once or twice.

Q. Have you been up and down the river from Grafton to LaSalle?

A. I have, but not while I was in the fish business.

Q. What was the condition of the Illinois river prior to the opening of the drainage canal, from Peoria to Havana and from Peoria to Henry?

5953 A. Below Peoria, at a low stage of the water it was muddy, mixed with manure and what we used to call slop, when we were fishing in it, supposed to be from the sugar works, and the slop refuse from distilleries. It was generally pretty strong smelling when it was stirred up and even when it wasn't stirred up it would smell pretty strong; that is below Peoria; it would smell there some what different than it was above.

Q. What was its condition above Peoria before the opening of the drainage canal?

A. Well, in Peoria Lake and the lakes above here, it was covered with a green scum during the warm season. The water itself looked green. It smelled badly with a different smell than below, but I couldn't tell exactly what the difference was, except it was noticeable.

Q. What effect, if any, did the water have upon fish and the life of fish before the opening of the canal?

A. Well, there were times, both winter and summer, that the fish used to die in numbers; in the winter more particularly above Peoria; in the summer, just from the distilleries on down.

Q. Did you ever see any dead fish in the river at the Copperas Creek Locks?

A. I have seen them but not at the locks; above here,
5954 Peoria, and down about four or five miles below Peoria.

Q. Did you ever do any ice fishing, that is fish through the ice?

A. Not to any extent. In fact, we didn't do any ice fishing.

Q. What has been the condition of the river since the opening of the drainage canal?

A. From Peoria on up, there is an absence of that green slime—

(Question and answer withdrawn.)

Q. Before the opening of the canal, what was the extent of the scum on the water from Pekin to Peoria?

A. It was pretty general there all through, but not so much as at Peoria and above.

Q. What effect would passing boats have on this scum, before the opening of the canal?

A. Oh, they would leave a wake or trail like, behind, through the green scum, a very clear trail.

Q. How long would that trail be observed?

A. Well, about as far as the eye could reach generally, unless the river was choppy.

Q. What has been the condpition of the river above and below Peoria since the opening of the drainage canal?

A. There has been an absence of the scum, and the smell has disappeared, almost altogether, except a little below
5955 the city proper here. The water was clearer apparently, and better.

Q. How is the water immediately below the Peoria bridge?

A. Good at present.

Q. Below the Peoria bridge?

A. Well, there is two bridges; the first one it is quite good and a little below that it is bad.

Q. In what way bad?

A. Riley and muddy and discolored somewhat.

Q. How far does that condition obtain?

A. It is noticeable pretty well all the way down the river to the Havana territoy. Below that I can't say.

Q. Well, immediately at Peoria, opposite the distilleries, what is the condition of the river there?

A. Bad.

Q. Just describe it captain, how it looks?

A. Well, it just simply looks filthy; I can't describe that much clearer—in comparison to the rest of the river.

Q. Any oily scum on it?

A. Sort of a scum, or filthy appearance to the surface.

Q. Any bubbles on it?

A. Lots of bubbles; plenty of those little patches of bubbles floating down all over.

5956 Q. Now, how far down the river does the condition immediately opposite the distilleries continue?

A. It continues pretty well to Pekin; then it clears up somewhat, and then it begins again and extends below Pekin for six or seven miles.

Q. How does the condition of the water above Peoria compare with that at and below Peoria?

A. It seems clearer and better in every way; better looking river.

Q. Have you ever drank the water of the Illinois river?

A. Yes, sir; both before and after the drainage was turned in.

Q. How does the water compare now with what it was before the canal was opened, for drinking purposes?

A. I have never heard of much, if any, sickness caused since the drainage was turned in from drinking the water, while I know that it was making them sick before it was turned in; any way I judged it was making them sick after seeing them drink it.

Q. Knowing the river as you do, before the opening of the drainage canal and since the opening of the canal, what is your opinion as to the effect of the drainage canal upon the waters of the Illinois river?

A. I would say it purifies it.

5957 Q. Is that true below Peoria as well as above?

A. I think it is to a considerable extent.

CROSS-EXAMINATION, by Mr. Jeffries.

Q. Can you name anybody that was sick from drinking the water before the canal was opened?

A. I can name one that I accused of getting sick from drinking the water.

Q. It was simply your judgment based upon a coincidence of their drinking the water of the Illinois river?

A. Well, it was because they were drinking it generally and were getting sick day after day; one after another of the crew.

Q. You haven't fished much since the drainage canal was opened, have you?

A. Not with anything except hook and line.

Q. What did you use in fishing before the canal was opened?

A. We used nets and seines—fyke nets.

Q. And during that time you were on the river pretty generally all the time?

A. I want to qualify that question there. I fished for one year after the drainage canal was opened.

Q. What year was that?

A. 1901, I believe.

5958 Q. 1900 or 1901?

A. Both. It was 1901, May about the 20th, that I quit the fishing business.

Q. How does the volume of water in the river now compare since the opening of the canal to what it was prior to the opening of the Chicago drainage canal?

A. In the spring time, in flood tide about the same stage. At this season of the year, or low water season, it is somewhat higher now, since the opening of the canal.

Q. How does the current in the river since the opening of the canal compare to what it was prior to the opening?

A. More current, apparently; I think there is.

Q. Well, don't you know there is.

A. Well, I will say I know there is.

Q. Before the canal was opened, during the greater part of the year, the water was kind of stagnant or still, was it not?

A. Yes, it was, in the summer months, above Peoria; there was quite a current below the bridge at Peoria always.

Q. And wherever that current was prior to the opening of the canal, for instance, below the bridge at Peoria there was no green scum formed or found, except that which floated down from the river above?

5959 A. Not that I know of; I don't know exactly where it came from, but it was all over the river generally.

Q. What was the character of that green scum?

A. Well, I couldn't say anything more than it was green scum; not being capable or able to analyze it, I don't know what it did come from.

Q. When you say the water is better since the canal was opened you do so upon the hypothesis or fact that there is a larger volume of water and more rapid current and the absence of the green formation upon the surface, and without reference to any examination made as to the ingredients of that water, do you not?

A. Well, I don't know why the water is better, but it seems to be better. Possibly the greater volume might háve something to do with it. But I base my knowledge of its purity from the experience, as I stated. It made several sick and I have known it made them sick before and not any since.

Q. Will you testify positively that you know that that was the cause of the sickness?

A. I know that they were drinking it and I told them that they would get sick from it and they did get sick from it; that is as near as I can come to knowing it; apparently got sick from it. Of course I don't know what makes anybody sick.

5960 Q. You think then the fact that the water of the Illinois river prior to the opening of the canal was so polluted with germs of disease, as to cause persons drinking it to become affected with the disease; that the discharge of the Chicago sewage, from a million people more or less, into the river, purifies the water or renders it more wholesome than it was before the canal was opened?

MR. TODD: I object to the question on the ground that the witness has not testified to anything wherein the germs of disease were spoken of, or that any germ was the cause of the sickness of the people whom he stated were made sick by drinking the water, and for the additional fact that the sewage from Chicago and the number of people whose sewage empties into the canal is not correctly stated in the question, for it eliminates the question of dilution of 250,000 cubic feet per minute of pure Lake Michigan water, which is mixed with this sewage before it enters the Illinois river.

JUDGE JOHNS: I object for the further reason that the hypothetical question does not inform the witness that substantially the same amount of sewage is now discharged into the Illinois river as there was for sixteen years prior to the opening of the drainage canal, and that the amount of dilution with Lake Michigan water is now eight times greater than it was prior to the opening of the canal.

5961 MR. JEFFRIES: In reply to the objection, it is suggested by counsel for complainant that the question is proper in order to test the ability of the witness to testify in regard to the subject matter, and in order to ascertain the premises upon which his opinions as a layman are based, and in order to show prejudice, the question of dilution of an exact amount of sewage discharged into the Illinois river being unnecessary for the reason that the witness is not an expert on the subject of dilution from a sanitary standpoint.

Q. (Last question read.)

A. Well, I can't say anything except the facts were as I stated, from whatever cause, in my personal experience.

Q. The fact that the sewage is discharged into the Illinois river at Chicago has no effect upon your mind as to the sanitary condition of the water in the river below and at Peoria, and above Peoria?

A. It hasn't because I never had any ill effects come under my observation.

Q. The fact that Chicago has for years been discharging its sewage into Lake Michigan until the water in the lake at, around and for a considerable distance out into the lake has become polluted so as to be unfit for domestic and household
5962 use, and the fact that Chicago is now discharging its sewage, or a great part of it, into the Illinois river, and diluting it with the polluted lake water, has no bearing and no weight upon your mind in passing upon the condition of the water in the Illinois river at Peoria and the points above and below, while the water of the Illinois river prior to the opening of the canal was so badly polluted as in your judgment, as was testified to by you a few moments ago, that it could and did cause sickness from drinking it; is that true?

A. As I answered before, I only know of the ill-effects before and know of none since. That is the particular reason why I paid no attention to the Chicago so-called sewage.

Q. You say you know of no particular ill-effects before the canal was opened, from drinking the water?

A. Since the canal was opened.

Q. Well, didn't I understand you to say in that last answer that you knew of no ill-effects either before or since?

A. My answer was, the reason I paid no particular attention to what they were saying of the Chicago sewage, and its effect, was that I knew of ill-effects before the drainage was in and none since; hence I gave no weight or thought to anything in reference to the water being worse now. I think it is better.

MICHAEL D. HURLEY.

5963 CHARLES F. BARTSON,

called as a witness in behalf of the defendants, being first duly sworn by the Commissioner, was examined in chief by Judge Johns and testified as follows:

Q. State your name, residence and occupation?

A. Charles F. Bartson; I live at 200 Green Street; I am in the saloon business.

Q. What was formerly your business?

A. Wholesale fish business.

Q. Where and for how long were you engaged in that business?

A. In 1892 I started and sold out in 1900.

Q. At what place were you in business?

A. Foot of Fulton Street, Peoria, Illinois.

Q. Were you engaged during that time in personally taking fish from the Illinois river with nets?

A. I was.

Q. Over what part of the river did your fishing operations extend?

A. Well, from I should judge about five miles below the Copperas Creek Lock, as far up as Chillicothe.

Q. Before the opening of the drainage canal, what was the condition of the Illinois river below Peoria, and down the river from Copperas Creek dam?

5964 A. Well, the water was a great deal lower then than it is now; the conditions that exist down there now are as they did then in regard to fishing.

Q. What are the conditions below here as to fishing, as to the matter upon the nets and the condition of the fish and the water?

A. The matter upon the nets is a sort of a slime; I can t say exactly what it is, but it accumulates on your nets so you have to wash the nets every day or two in order to fish successfully with nets.

Q. Was there any substance formed upon the surface of the water below Peoria before the opening of the drainage canal in 1900?

A. Well the water was green, a green scum formed upon it.

Q. Was there any odor to the water?

A. Yes there was some odor.

Q. What was the condition of the fish below Peoria before the opening of the canal?

A. Well, whenever we got a bad winter, it killed a great many of them. In summer I have seen fish come to the top by hundreds, the gas killed them.

Q. Did they have a taste?

A. Why at certain times of the year when there was ice on the river they got so bad we couldn't use them.

5965 Q. During what season of the year below Peoria was this scum upon the water ?

A. During the summer months.

Q. Was it a common thing below Peoria to have the fish die in summer?

A. Why yes, there was quite a few of them died.

Q. Above Peoria and before the opening of the drainage canal, what was the condition of the water?

A. The water was low and it had that green scum on top; it was virtually green.

Q. Did it have an odor?

A. No, not as bad as down below.

Q. Did it have any odor above Peoria prior to the opening of the drainage canal?

A. No, I don't think it did, none that I ever noticed.

Q. When fish were caught, how did they exist in live-boxes?

A. You couldn't keep them very long; they died very soon.

Q. Now since the opening of the drainage canal, what has been the condition of the Illinois river below Peoria?

A. Well the water is a great deal higher, and I have never seen any of the green scum on the river like it was heretofore.

Q. How about the slime upon the nets?

A. The slime is still there.

5966 Q. Above Peoria, what has been the condition of the Illinois river since the opening of the drainage canal?

A. Well there is more water and I have never seen it green or with a scum on it since the canal was opened.

Q. Have you fished any in the winter either above or below Peoria prior to the opening of the canal?

A. Yes sir.

Q. What was the condition of the water in the river below Peoria when it was frozen over?

A. The water was generally bad, especially so during a bad winter, a heavy winter.

Q. What effect did it have upon the fish in the winter under the ice?

A. It killed a great many.

Q. Was there an odor in the water under the ice in the river below Peoria?

A. There was.

Q. As to the strength of the odor was it a strong smell or was it scarcely perceptible?

A. Well at times it was stronger than others. Sometimes you could smell it real plain and others you wouldn't notice it so much.

5967 Q. Since the opening of the drainage canal, what has been the character of the water in the river above Peoria in the winter under the ice?

A. It has been good.

Q. Have the fish died under the ice since the opening of the canal?

A. Not that I know of.

Q. Prior to the opening of the canal above Peoria, what was the condition of the water in the winter?

A. Once in a while you could smell a slight odor above Peoria through the ice.

Q. Since the opening of the drainage canal, what has been the condition of the fish above Peoria as to their living in live-boxes?

A. It has been good.

Q. Do they now live longer than before the opening of the canal?

A. Yes, they live three or four times longer now than they did before.

Q. As to the condition, the strength and health of the fish, which time or period it seemed better, before or since the opening of the canal?

A. Since the opening of the canal.

5968 Q. Before the opening of the canal, were you personally engaged in fishing operations on the river?

A. Yes sir.

Q. Did you drink the river water sometimes?

A. Occasionally.

Q. What was its effect upon you?

A. Why, it caused me a spell of sickness.

Q. Since the opening of the drainage canal as compared with the time before the opening and above Peoria, how is the water for drinking purposes, better or worse?

A. Better.

Q. Are you acquainted with the fishermen along the Illinois river from Chillicothe to Copperas Creek?

A. Most of them.

Q. What has been the condition of the health of people living upon the river since the opening of the drainage canal as compared with their condition before the opening of the drainage canal?

A. It has been better.

Q. Since the opening of the drainage canal, have you known of any typhoid fever among the fishermen?

A. I have not.

Q. Prior to the opening of the drainage canal, did you know of typhoid fever among the fishermen?

5969 A. I knew of one case sure, and a few others that they said was typhoid. I couldn't swear as to that.

MR. JEFFRIES: I move to strike out what the witness was told by others, from the record, for the reason that it is hearsay.

Q. Take the fishermen as a class and compare them as a class with people engaged in other pursuits, in the same vicinity, how does the health of the fishermen compare with the health of the people engaged in other pursuits, is it better or worse?

A. It is better.

CROSS-EXAMINATION,

By Mr. Jeffries.

Q. How long have you been fishing?

A. I started in 1892 and sold out in 1900, eight years.

Q. Have you ever fished any since 1900?

A. No sir; not since the spring of 1900.

Q. What month in 1900?

A. We sold out our business I think, in June; I am not positive about that.

Q. And you quit fishing immediately after you sold out?

A. Yes sir.

Q. And haven't fished any since?

A. Only with a hook and line.

Q. Then you have fished in the Illinois river as a fisherman only from January 17th, 1900 to June, 1900, since the canal has been opened?

5970 A. Yes sir.

Q. There has been a very large increase in the volume of water since the canal was opened?

A. Yes sir.

Q. And a very great increase in the flow of the current?

A. Yes sir.

Q. Prior to opening the canal, there was scarcely any current?

A. Very little current.

Q. How long before the canal was opened that these two cases of typhoid fever among the fishermen occurred?

A. Only one that I knew; that was my own; that was I think in 1896, when I got sick myself.

Q. 1896?

A. I think that was the year, yes sir.

Q. Did your physician tell you that you were immune from typhoid fever after that; that you wouldn't have it any more?

A. No sir, he did not.

Q. That's the only case that you know of?

A. I have heard of others, but that's only hearsay; I can't tell for certain that they had it.

Q. Well name some of them?

A. Some of the men that worked for me.

Q. Who were they?

A. A fellow by the name of Hughes.

5971 Q. You don't know that he had typhoid fever?

A. I don't know that I had it, only from what the doctor said.

Q. Not having been fishing since June, 1900, you of course haven't kept account of the sickness which occurred among the fishermen?

A. No, I never kept account of them; only those that I would meet.

Q. You are not on the river now and have not been since 1900, any considerably, only as you fished with a hook and line?

A. Oh I go out occasionally; I go out with the fishermen.

Q. Are you a retired fisherman?

A. I don't know what you mean by that.

Q. What business are you in now?

A. The saloon business.

Q. And have been ever since you sold out?

A. Yes sir.

CHAS. F. BARTSON.

5972 I. N. FEGER,

called as a witness in behalf of the defendants, being first duly sworn by the Commissioner, was examined in chief by Judge Johns and testified as follows:

Q. You may state your name, residence and occupation?

A. I. N. Feger; Peoria, Illinois; electric business.

Q. How long have you resided in Peoria?

A. Thirty years.

Q. Have you fished upon the Illniois river during your residence here and if so in what manner and during what time?

A. Well I have fished here all my life; just hook and line fisherman.

Q. Between what points on the Illinois river have you fished with a hook and line?

A. From Havana to Henry.

Q. Prior to the opening of the drainage canal in January, 1900, what was the condition of the water in the Illinois river above Peoria?

A. I considered it bad.

Q. In what respect?

A. Oh, it was scummy and green and sluggish.

Q. Did it have an odor?

A. Yes sir.

5973 Q. What was the condition of the fish above Peoria?

A. Well, very bad.

Q. In what respect?

A. Well they were soft, and I have known them to bury lots of them. I know down here at Pekin the city had to hire people to go and bury them; down at Pekin, Illinois.

Q. What was the condition of the water in the Illinois river below Peoria before the opening of the drainage canal?

A. Well I considered that bad too.

Q. Describe it as to its color, scum if any found upon it, and odor?

A. Well it was yellow scum; I can't tell what the odor was, but there was an odor, a bad odor.

Q. Since the opening of the drainage canal, what has been the condition of the river below Peoria?

A. It has been much better.

Q. What has been the condition of the fish?

A. They are better too.

Q. Since the opening of the drainage canal, what has been the condition of the water and the fish above Peoria?

A. Been good.

Q. Which is and has been the better water, that above

Peoria or that below Peoria, both before and since the opening of the canal?

5974 A. Above Peoria.

CROSS-EXAMINATION,
By Mr. Jeffries.

Q. When you say the water is better now than it was before the canal was opened, you are expressing your opinion from the fact that there is a better current, a larger volume of water and the water is clearer?

A. Yes sir.

Q. As to the chemical or bacteriological properties of the water, you know nothing?

A. No sir.

Q. You don't know whether the filth from Chicago has polluted the water with disease germs or not?

A. No sir. I. N. FEGER.

5975 R. R. BOURLAND,

called as a witness in behalf of the defendants, being first duly sworn by the Commissioner, was examined in chief by Judge Springer and testified as follows:

Q. Please state your name, residence and occupation?

A. R. R. Bourland, residence is Peoria, Illinois; my occupation is real estate and loan business.

Q. Have you held and do you now hold any position upon the Illinois River Valley Association?

A. Yes sir, I am the secretary of that association.

Q. Will you please state what the objects of that association are and how long it has been organized?

A. The object of the Association is to look after the interests of the residents in the Illinois Valley in relation to the use of the river itself.

Q. How long has that association been in existence?

A. About—the present association, since 1897, the present association being the successor of one or two like associations which came before it.

Q. How long have you been connected with the association?

A. Since 1897, since its organization.

Q. How long have you lived in Peoria?

5976 A. All my life.

Q. As a citizen of Peoria and as the secretary of this association, have you had occasion from time to time to observe the condition of the Illinois river?

A. Yes sir.

Q. You may state what the condition of that river was prior to the opening of the Chicago drainage canal in 1900?

A. It was an ordinary, sluggish stream that was disagreeable in low water.

Q. You may state if you can, the difference if any in the condition prior to the opening of the canal—above Peoria and below Peoria?

A. The river above Peoria was as I said an ordinary, prairie stream; below Peoria it was very much affected by the drainage of Peoria, and was a much more disagreeable stream below.

Q. Did you notice any odor coming from the water during this period, from above and below Peoria?

A. There was certainly an odor from below; I am not so positive as to the fact of the odor coming from above.

Q. Have you traversed the river above Peoria on steamboats and other crafts?

A. Frequently.

Q. Both before 1900 and after?

A. Yes sir.

5977 Q. You may state the condition of the water in the Illinois river since 1900 above Peoria first, and afterwards below Peoria.

A. Above Peoria, it is certainly a great deal better now than it was before 1900.

Q. In what respect?

A. The water is clearer in color and does not get so low at low water, and therefore does not have disagreeable features of the former low stage of water.

Q. Now state the conditions below Peoria, since 1900 so far as you have observed them?

A. Below Peoria, the waters still show the effect of the offal from the factories, but not to the same extent as before, because of the greater volume of water and I find the odor not nearly so apparent as it formerly was.

Q. State what is the difference between the conditions of the river and of the banks of the river next to the water since the opening of the canal with reference to its use for excursion parties, etc.?

A. Before 1900, the use of the river for pleasure craft was almost entirely given up during low stage of water. Since that time there is continual use of the river by a great many people for pleasure purposes. I don't think that there were any houseboats as they are called, on the river before 1900, and 5978 there are now quite a number which are used as summer residences by a number of people.

Q. For commercial purposes or mere pleasure?

A. Mere pleasure.

Q. Are there any pleasure boats used now as compared with what were used before the drainage canal was opened?

A. There are many more now.

Q. State whether there is any difference in the manner of rowing for pleasure on the river above Peoria compared to what it was before?

A. There is a difference in the amount; I don't know of any difference in the manner.

Q. A great many more row for pleasure?

A. For pleasure.

Q. A great many more?

A. A great many more.

CROSS-EXAMINATION,

By Mr. Jeffries.

Q. When did you say this society was organized?

A. My recollection is in 1897, or about that time.

Q. And is it a mutual association of individuals or is it a corporation?

A. It is a mutual association of individuals, yes.

5979 Q. What is the membership?

A. The membership is by appointment of the mayors of the cities and presidents of the villages and from the county officials sometimes, of the villages and cities situated along the river valley from Joliet to Alton. There were about forty members appointed in that way. I haven't the number exact in my mind. Our convention has been attended however, by from two to four hundred delegates.

Q. What did you say the object of the association was?

A. Simply to look after the interests of the residents of the Illinois river valley in relation to the use of the river itself.

Q. And no other object.

A. No other object.

Q. Do you mean the use of the river or the use of the land along the river?

A. The use of the river.

Q. You are not looking after the interests of the residents who have overflowed land caused by the increased flow of water in the Illinois river?

A. No sir.

Q. You are looking after deep water navigation?

A. I would like to amend that answer perhaps by saying that any question of that sort would be and has been sub-
5980 ject of discussion at the meetings.

Q. But no action has ever been taken on anything of that kind?

A. Yes sir, there was a committee appointed last fall which was authorized to take steps to secure the removal of the dams if possible; for that purpose. That however, was not one of the stated objects of the organization of the association.

Q. Now then, that other question that you didn't answer; to look after deep water navigation?

A. That is one of the objects, yes sir.

Q. That is the principal object?

A. At the present time it is the principal object.

Q. That has always been the principal object has it not?

A. Well, that has always been an object.

Q. Well, if that has not always been the principal object, what has been the principal object?

A. The general best use to be made of the river.

Q. Well, that is just a little bit too general; we want to get at the minutae upon which or for which this association was organized?

A. The organization originally grew out of the turning in or of the drainage law of 1889, which gave the prospect of an increased flow through the river, and the main object at 5981 the time of the first society of this kind which I refer to was to secure in the law of 1889, such provision as would protect the residents of the Illinois valley from any deleterious pollution of the river by Chicago drainage and at the same time to secure such advantages for navigation as might be secured by the increased flow through the canal if ever constructed.

Q. You knew at the time that there was no city or town on the Illinois river that obtained its water directly from the river, did you not?

A. The supply for Peoria was at that time drawn from the river. I know nothing about the supply for other cities.

Q. And since that time Peoria has abandoned the river?

A. Yes sir.

Q. You knew at the time that this canal was not being constructed for navigation purposes, did you not?

A. I certainly did not know that.

Q. You had read the drainage law had you not?

A. I certainly had.

Q. You knew that at the time that it was being constructed for the purpose of discharging the sewage from Chicago this way?

A. Yes sir, under the restrictions of the law of 1889.

Q. Now what has been, in your judgment, the extent of 5982 the increased volume of water in the Illinois river since the canal has been turned?

A. I think it has raised the water in the river about two and a half feet, in low water, and in high water it is absolutely impossible to estimate it.

Q. With reference to the current, what has been the effect?

A. That—from my observation I should say that the current in the narrow part of the river was materially increased.

Q. Now as a matter of fact before the canal was opened, during a great portion of the year, there was practically no current in the river?

A. There was no current at low water apparent between the dams.

Q. You have never examined the water chemically or scientifically?

A. Never.

Q. What is your business?

A. Real estate and loan business.

Q. As to whether or not it is better for domestic use, and as to whether it contains less or more deleterious substances, since the opening of the canal, you know nothing about it?

A. Nothing.

5983 Q. When you say it is better you simply judge from its appearance and also make that statement that it is better for the uses to which the river might be employed?

A. That is all to my knowledge.

RE-DIRECT EXAMINATION, By Judge Springer.

Q. When did Peoria abandon the Illinois river as a water supply?

A. I think that was about twelve years ago; but the best evidence would be the record.

Q. That is accurate enough. What was the cause, if you know, for abandoning the river at that time, as a water supply?

A. The river furnished water which was very offensive, especially during the time when it was covered with ice and also during the low water of the summer; two seasons of the year that the water was very bad.

R. R. BOURLAND.

5984 JOHN D. McCLURE,

called as a witness in behalf of the defendants, being first duly sworn by the Commissioner, was examined in chief by Mr. Todd, and testified as follows:

Q. What is your name?

A. John D. McClure.

Q. What is your business?

A. I am in the real estate and loan business.

Q. In Peoria?

A. Yes sir.

Q. How long have you lived in Peoria?

A. For fifty-three years.

Q. Have you been acquainted with the Illinois river before and since the opening of the drainage canal?

A. I have.

Q. During what years?

A. Well for fifty-three years I have been on the river every year a great many times; every summer fishing and hunting.

Q. Will you describe the condition of the Illinois river before and since the opening of the canal, and state what in your opinion has been the effect of the opening of the canal upon the waters of the Illinois river?

5985 A. Well, previous to the opening it was at times very offensive, a green scum would form on it and a sticky, gassy smell to it, especially in low water, and when the ice was on the river whenever we attempted to use the water, and my observation is that since the opening of the canal it has been very much improved; the water has been better; at least there is not so much of a smell and not so much scum forms as there did before.

Q. How about the purity of the water?

A. Why, the water apparently seems purer. I never have analyzed it or know what the action is on it, but it appears purer than it did before.

CROSS-EXAMINATION, by Mr. Jeffries.

Q. How long did you say you have lived in Peoria?

A. Fifty-three years last May.

Q. Are you out upon the river much now?

A. Fishing and so forth; I was out four or five times last spring.

Q. You don't know anything about the sanitary condition of the water other than what you observed?

A. No.

Q. You don't know what effect the sewage of Chicago has had upon the water as far as its sanitary condition is concerned?

5986 A. No, as to its sanitary condition I do not.

Q. You do know however, that there has been a better current and an increase in volume?

A. Yes sir.

Q. And a better current?

A. Better flow of water than there was before.

JOHN D. McCLURE.

5987 JUDGE JOHNS: I now hand the Commissioner an envelope containing twenty-six tickets, which it is admitted were made by the witness Charles F. Hixson, and which would have been identified by him in his testimony today if the tickets had been present.

I will ask the Commissioner to mark them State of Illinois Exhibit No. 11 for identification, to the testimony of the witness C. F. Hixson.

To all of which counsel for complainant assents.

Envelope marked as requested.

ADJOURNED until 9:00 a. m., following day, Thursday August 13, 1903.

5988 National Hotel, Peoria, Illinois. 9:00 a. m., Thursday, August 13, 1903. Continuation pursuant to adjournment.

Present, the Commissioner and same counsel representing the respective parties.

NAT H. COHEN,

called as a witness in behalf of the defendants, being first duly sworn by the Commissioner, was examined in chief by Judge Johns and testified as follows:

Q. State your name, residence and occupation?

A. Nat H. Cohen, president Illinois Fish Commission, Urbana, Illinois.

Q. In what part of the state is Urbana?

A. Eastern part.

Q. How long have you been connected with the Illinois State Fish Commission?

A. Since 1897.

Q. Prior to that time were you at all familiar with the Illinois river?

A. I was.

Q. How did you become acquainted with it?

5989 A. By fishing in all the lakes from Havana to Meredosia.

Q. Prior to that time had you fished in the Illinois river any?

A. Not any.

Q. Is the Illinois State Fish Commission an organization authorized by the laws of the State of Illinois?

A. It is.

Q. What are its duties?

A. Enforcing of the law and to collect fish for distribution.

Q. That is the enforcement of the laws for the preservation of fish in the waters of Illinois?

A. For the preservation and protection of fish.

Q. Of how many persons is the Fish Commission composed?

A. Three members, the president, superintendent and treasurer; two of which are active, the superintendent and the president.

Q. For how long a time has such commission existed under authority of the laws of Illinois?

A. Organized in 1877.

Q. What is the principal stream in Illinois over which it exercises jurisdiction?

A. The Illinois river and its tributaries.

Q. In the exercise of this supervision has it men in its 5990 employ?

A. It has, wardens, and the crew of the steamer Illinois, consisting of seven or eight men.

Q. How many wardens under the employ of the Fish Commission are on the Illinois river as a usual thing?

A. The new law went into effect July 1st, which provides three wardens. Prior to that they were in every county along the river. There was a warden in almost every county along the river.

Q. To whom do these wardens make reports?

A. To me.

Q. What is the boat called the Illinois?

A. A steamboat employed by the Illinois Fish Commission to patrol the river for the enforcement of the law and to collect fish for distribution from the over-flows of the ponds and lakes adjacent.

Q. How are these fish collected?

A. With a crew, with a seine. They collect them in the seines in the bayous, bring them to the boat by a skiff. They are then put into receptacles on board of the steamer, ready for distribution.

Q. Are these fish afterwards distributed to the various waters of the State?

A. Yes.

5991 Q. How far up the river does the boat travel?

A. Our jurisdiction is from Grafton to LaSalle; that is as far as the Illinois boat can navigate.

Q. How much of a distance is that?

A. About 270 or 280 miles. I don't know exactly the distance, what it is.

Q. Now, in your business as president of the Fish Commission have you traveled the river considerably both since and before the opening of the drainage canal?

A. Yes sir.

Q. What was the condition of the Illinois river above Peoria before the opening of the drainage canal, as to the amount of water, the color, the growth in it, the odors, if any, and in your answer, give a full description—above Peoria?

A. That depends upon what time of year you refer to.

Q. Well you may tell at all times of the year.

A. In the spring during the freshet, I couldn't tell much difference in the water, but as the summer came on and the water receded from the banks, the water became stagnant, little or no current, covered with a green scum and with a bad odor. The lakes adjacent were low, in a very high temperature destroying fish from decayed aquatic matter; destroying what we term plantain. Plantain is the vegetable and animal life in the water that the fry, the small fish, live on. The temperature becomes so high that they are all destroyed. 5992

That I found in several lakes adjacent to the river; Stewart Lake, Spring Lake, Thompson Lake, where they were covered with thousands of dead fish from this cause. Since that time, the same lakes, the temperature is much lower; the water much clearer and we find an absence of dead fish.

Q. I was asking you more particularly in regard to the river above Peoria and confine your description to that, before the opening of the drainage canal?

A. Well I can't give you a great deal of information about above Peoria before the opening of the canal, except that the water is much clearer now than it was prior to that.

Q. Above Peoria and before the opening of the drainage canal did a scum form upon the water?

A. It did.

Q. Do you know an aquatic plant which is sometimes called duck weed?

A. Yes.

Q. And sometimes water-clover?

A. Yes.

Q. And sometimes shamrock?

A. Yes.

Q. Did that form upon the river prior to the opening of the drainage canal?

A. Yes.

5993 Q. If there was any scum upon the water in the river above Peoria prior to the opening of the drainage canal, different from this duck-weed, describe it?

A. Well, it was a scum that is usually on stagnant water; I can't exactly explain it any different; you find this scum all over the country on stagnant water.

Q. Did the water have an odor?

A. It had an odor.

Q. Can you tell the nature of that odor, or describe it?

A. No sir, I cannot, only it smelled very foul.

Q. What was the condition of the fish in the Illinois river above Peoria and before the opening of the drainage canal?

A. Well as a general thing the coloration was much lighter and they didn't have the tenacity of life that they have now.

Q. Do you know anything about the condition of the water of the Illinois river in the winter, above Peoria?

A. I do not.

Q. What has been the condition of the river above Peoria since the opening of the drainage canal?

A. The water seems to be clearer, the temperature lower, and a stronger current.

Q. What is the condition of the fish above Peoria since the opening of the drainage canal?

A. I think they are much better, those that I have seen.

5994 Q. Are they stronger and healthier now than before the opening of the drainage canal above Peoria?

A. Yes, because the temperature is lower.

Q. How is the temperature of the water in the sloughs and ponds which are filled up by the overflow?

A. Lower now at present, because all these sloughs and lakes have an inlet from the river.

Q. As to the quantity of the fish in the Illinois river above Peoria, which is it, greater, before or since the opening of the drainage canal?

A. As far as we are concerned, we have had no opportunity to find out as the water has been so high that we couldn't collect and we haven't taken as many fish since the drainage canal has emptied into the Illinois river than before; but in my opinion there are a great many more fish than before, but is has been impossible to take them with any other device than hook and line.

Q. When the fish spawn in the Illinois river where do they go?

A. To the shallow lakes and bayous, in from one to four feet of water, back in the woods; or shallow places of any description.

Q. Is the higher stage of the water more favorable to the production of fish?

5995 A. Yes, they have more territory to cover and a more favorable supply.

Q. And better protection?

A. Better protection, oh yes.

Q. Before the opening of the drainage canal, what was the condition of the Illinois river from Peoria to Pekin?

A. Very foul.

Q. In what way?

A. Bad odor, green scum and frequently we would find dead fish floating.

Q. What was the condition of the Illinois river during the same period, from Pekin to Copperas Creek dam?

A. It was bad down there too.

Q. Was it as bad seemingly, as from Peoria to Pekin, or did it seem to improve somewhat?

A. Well I never paid a great deal of attention to it, any farther than from Peoria to Pekin in regard to the pollution or bad odor, but we would frequently find these floating islands from the offals from the distillery as far down as Copperas Creek.

Q. What were the floating island composed of?

A. Refuse from the distilleries of Peoria.

Q. How did they get in the river?

A. That I don't know. But you wouldn't find them 5996 above.

Q. Prior to the opening of the drainage canal what was the condition of the Illinois river between Copperas Creek dam and La Grange dam

A. Well it was slow current, green scum as a general thing, at low water, and it had a bad odor certain months in the year.

Q. Take the stretch of river between Copperas Creek and La Grange before the opening of the drainage canal and the stretch of river from Copperas Creek to Pekin, which was the better water?

A. Below; from Copperas Creek to La Grange was better water than from Peoria to Pekin.

Q. Prior to the opening of the drainage canal, what was the condition of the Illinois river between La Grange dam and Kampsville dam?

A. Well I think it improved as it went down.

Q. Was there at that time some odor in the river and some scum upon it?

A. There was; almost as far down as Grafton.

Q. Take the stretch of river between LaGrange dam and Kampsville dam, prior to the opening of the drainage canal, how did it compare with the water between Peoria and Copperas Creek?

5997 A. I think the water was better as you went down further.

Q. How did the water between La Grange and Kampsville dam compare with the water in quality and appearance, between Copperas Creek and La Grange?

A. Well to tell the truth I couldn't tell much difference, only that I have the opinion that the farther you went down we found less green scum.

Q. What was the condition of the water before the opening of the drainage canal between Kampsville and Grafton?

A. I didn't find a great deal of difference between Kampsville and Grafton, than I did above, that is, Kampsville and La Grange, although we didn't go down there frequently; only occasionally.

Q. Was it a better water than the water between Copperas Creek and La Grange?

A. I think there was less green scum.

Q. And less evidence of impurities?

A. Yes, it looked as though there were.

Q. What was the condition of the fish between Peoria and Copperas Creek before the opening of the drainage canal?

A. Well the game fish were of a light color and they wasn't as healthful as they seem at present; they wouldn't live as long out of water. When the temperature gets up to
5998 90 to 100, it is hard for fish to exist, and the temperature was sometimes as high as 90 to 110 in some of those lakes adjacent to the river prior to the opening of the drainage canal.

Q. By 90 to 110, do you mean degrees of temperature Fahrenheit or Centigrade?

A. Fahrenheit.

Q. Since the opening of the drainage canal, what has been the condition of the water between Peoria and Copperas Creek?

A. Much better than it was prior to that.

Q. In what respect?

A. Clearer, less green scum, and a lower temperature.

Q. Is Pekin below Peoria and above Copperas Creek dam?

A. Yes.

Q. Is there a large amount of stuff cast into the river at Pekin?

A. There is.

Q. From what source?

A. From distilleries and city sewage.

Q. Do you know of a glucose factory at Pekin?

A. I have heard of one; I don't know of it.

Q. Since the opening of the drainage canal, what has been the condition of the water of the Illinois river between Copperas Creek and La Grange dam?

5999 A. Much better; the water looks better.

Q. How does it compare with the water above Copperas Creek?

A. It is better.

Q. What has been the condition of the fish between Copperas Creek and La Grange since the opening of the canal?

A. Much better, finer color, have more tenacity of life and I regard them healthier and better than ever before.

Q. Since the opening of the drainage canal, what has been the condition of the water between La Grange and Kampsville dam?

A. Much better than it was.

Q. How does it compare as to purity with the water between Peoria and Copperas Creek?

A. Well I can't say exactly as to that, only that it is much better than it was before the drainage canal entered the river. I couldn't tell exactly whether it is better than above because I have never tested it only by appearance, temperature and the quality of fish taken.

Q. Judged by its appearance and such superficial examination as you have made, which would you say was the better water now, that between Peoria and Copperas Creek or that between La Grange and Kampsville?

A. I think the water between La Grange and Kampsville is the best of the two.

Q. Since the opening of the drainage canal, what has been the condition of the water in the Illinois river between
6000 Kampsville and Grafton?

A. Well I can't say anything about that, any more than it improved as it went down.

Q. How does it compare now with the water in the same stretch of river before the opening of the drainage canal?

A. Oh, it is much better now.

Q. How does that stretch of water compare with the water between Peoria and Copperas Creek?

A. Well now, I have never tested that water down there; all I know about it is what the people and fishermen said at that part of the river. We have never fished down there so I can't say as to that; only what the fishermen say; but we found that the farther you go down the better the water is.

Q. Since the opening of the drainage canal have you traveled upon the river from Kampsville to Grafton several times?

A. Yes sir.

Q. And in traveling have you observed the water in a general way?

A. Yes sir.

Q. In your observation of the Illinois river, state whether or not, the waters as they travel from sources of impurity, tend to purify themselves? Seem to purify themselves?

A. Yes they do, in my observation.

6001 Q. Have the varieties of fish in the Illinois river increased or decreased since the opening of the drainage canal?

A. Well we occasionally find a herring from Lake Michigan but the conditions of the Illinois river are not suitable for the fish of Lake Michigan. The fish that inhabit Lake Michigan are mostly salmonidea and they require a very low temperature. Should they inhabit the Illinois river for any length of time they would deteriorate so that they would be worthless, as conditions are not right for that family of fish and they are only indigenous in a low temperature and in the Great Lake system. And the drainage canal has not added any new fish to the waters of the Illinois river.

Q. Was there a time in the Illinois river when pike and pickerel were very numerous here?

A. There was.

Q. Did they afterwards disappear?

A. Well now, they have disappeared for several years; they come one season and the next season they are not there. They are a migratory fish and they come and go. There was a time when they were plentiful in these waters, and they are becoming more plentiful now in the last two years, but I wouldn't like to state the cause why.

Q. What do you know of the fish ordinarily termed the spoon bill cat?

6002 A. Well we only know that as we see them. Scientists know very little of where they propogate and they are a migratory fish and come up the river and tributaries to spawn in high water. Regarding their other habits, there is very little known.

Q. Do they seem to be increasing in the Illinois river?

A. Well, we find them up above on account of the high water above the dams. They go up the river as high as they can go and that is the cause of their being more plentiful than they were before.

Q. Do you know of a fish termed by the fishermen "cushon" or Mississippi river catfish?

A. Yes.

Q. Do you know whether now they are found in the lower stretches of the Illinois river?

A. Yes, they are.

Q. Do they seem to be increasing since the opening of the drainage canal?

A. I can't tell you that.

Q. Along the entire stretch of the Illinois river from La Salle to Grafton, what is the condition as to lands overflowed during high water; is it much or little?

A. There is a great deal of land overflowed all along the river, from LaSalle to Grafton; thousands of acres of crops
6003 were destroyed last year; corn fields and wheat fields inundated and floated down the river.

Q. When the waters subside are there any ponds on these overflowed lands that lose their connection with the Illinois river?

A. Yes, a few. There is where the temperature becomes so high, in those places. It kills the fish.

Q. Is it such places that you seine?

A. Yes, those are the places where we get our fish for distribution. If there is an outlet we don't go in there to get our fish. It is only these sloughs and bayous that evaporate during the summer that we take these fish from. The larger and coarser fish we take from the river and only take such fish as bass, croppie and perch.

Q. In what condition when you seine now, do you find the fish in these ponds as compared with their condition in the same ponds prior to the opening of the canal?

A. They are darker; that is the sign that they are healthier. The water has hardly been low enough for the last three years for us to go into many of these sloughs, and those that we go into now are from two to three feet. Prior to that we used to get them in eighteen inches of water.

Q. Is there a large fishing industry on the Illinois river?

6004 A. Yes sir, from five to ten thousand people employed on on the river from LaSalle to Grafton, and bringing into the state probably $500,000 and shipping out from twelve to fifteen millions pounds of fish per annum.

Q. Where do these people who follow the business of fishing generally live?

A. Along the river, in boats, cabin-boats and in the villages, the larger part of them in cabin boats.

Q. So far as you have observed, what has been the condition of health of the people engaged in fishing, both before and since the opening of the drainage canal?

A. Well from all the information I get along the river, they say there is less malaria and scarcely any typhoid fever among the fishermen in the last three years. They tell me they drink the water now and they couldn't drink it before.

Q. As a general thing what is the condition of health of these people engaged in fishing as compared with a similar number of people engaged in some other occupation away from the river?

A. I can't tell you that.

6005 CROSS-EXAMINATION,

By Mr. Jeffries.

Q. How long did you say you have lived on the Illinois river?

A. I don't live on the river; I have been connected with the river for five years; I have been connected with the fish Commission since 1897.

Q. You are connected with the State Fish Commsision?

A. Yes.

Q. How often were you on the river prior to 1897?

A. About five or six weeks every summer.

Q. What is the difference in the flow of the river now as compared to what it was before the drainage canal was opened?

A. Well, there is a much swifter current than there was before. It used to be about a half mile an hour; that's what they tell me, about a half an inch fall to the mile for two hundred miles and there wasn't over half to three-quarters of a mile current at certain seasons of the year. You could hardly tell which way the current went in the summer months.

Q. Can you tell which way the current runs now?

A. Yes.

Q. There has been a very great increase in the flow of the current?

A. Sometimes eight or ten feet or more. Yes. Whether 6006 that was due this year to the heavy floods or the drainage canal, I am not ready to say.

Q. But there has been a very great increase in the current since the drainage canal was opened, every year?

A. Yes sir.

Q. You spoke of a green scum being formed on the river before the canal was opened; now that forms along the water since the drainage canal was opened?

A. To some extent; there is a green seed that forms along the river and probably there is some green scum yet, but all I have found is that green seed.

Q. When you say the water in the river is better since the opening of the canal than it was before, you think that from the fact that the current is better, the temperature of the water is better, and from its appearance?

A. Yes, and the fish are better; the color of the fish is darker, and the temperature is lower;that is as far as I can judge myself.

Q. That is as far as your investigations have gone?

A. Yes sir.

Q. As to whether or not the sewage from Chicago contaminates the water, you don't know anything about?

A. No.

Q. The condition of the fish is improved because of the decrease in the temperature of the water?

6007 A. Yes.

Q. And the temperature of the water?

A. Yes.

Q. And not with reference to any particular purification or the absence of impurities in the water?

A. Well, you see, game fish will not live in anything but pure water, and they will not get the color they have got unless the water is pure, that is to say bass and light species.

Q. Do you mean chemically pure

A. Well, I won't say that exactly because I have never analyzed it or never had it analyzed, but from every observation that I have made, bass won't thrive only in pure water, and if the water should be foul and there is a spring close by yo will always find the bass in the pure water. Of course the fish, large mouthed bass can live in temperature from 35 to 95, but they deteriorate with a high temperature, and it isn't necessary that these large mouthed black bass will not live in waters that are somewhat foul.

Q. Water with a high temperature is not necessarily foul?

A. No I say that; not altogether; but the heat absorbs the oxygen and the fish cannot live; that is the cause. The heat and high temperature; that is in low water.

Q. The carp is the most prolific fish in the river isn't it?

A. Yes; they can live under any circumstances and under 6008 all conditions.

Q. And they feed on most anything?

A. They feed on most anything; but the quality depends upon the environments.

NAT. H. COHEN.

6009 DR. FRANK C. BOURSCHEIDT,

called as a witness in behalf of the defendants, being first duly sworn by the Commissioner, was examined in chief by Judge Springer and testified as follows:

Q. State your name, residence and occupation?

A. Frank C. Bourscheidt, Peoria, Illinois; I am a physician and surgeon.

Q. How long have you resided in Peoria?

A. Since 1874.

Q. What has been your connection with the city government if any?

A. I have been health commissioner.

Q. During what time?

A. That was in 1898 to 1901.

Q. Have you made any special study of chemistry and bacteriology?

A. I have.

Q. Have you observed during your residence in Peoria, the condition of the water in the Illinois river above Peoria and below Peoria?

A. I have at different times; different occasions.

Q. Will you please state the condition of the water above Peoria prior to the year 1900, the opening of the drainage canal?

(Question withdrawn).

6010 Q. As Health Commissioner of the City of Peoria, have you any knowledge as to the condition of the health of the city before and after the opening of the drainage canal?

A. Yes.

Q. Please state then, what you know in regard to this?

A. I don't think there is much difference, if any, in the death rate, before and after, from enteric diseases.

Q. You may explain what you mean by enteric?

A. Diseases like typhoid and intestinal disorders. Our death rate has always been normal.

Q. Does the period to which you refer relate to the time since the present waterworks system was established?

A. Yes.

Q. You may state what is the present water supply of the city of Peoria?

A. At the present time the supply of water is obtained from wells which intercept the spring water which comes from this high plateau north of the city.

Q. Are these wells supplied with water directly or indirectly from the Illinois river?

A. No sir.

6011 Q. Then your water supply has nothing to do with the conditions in the Illinois river?

A. Nothing at all.

CROSS-EXAMINATION,

By Mr. Jeffries.

Q. You were not Health Commissioner twelve years ago?

A. No sir.

Q. You were not health commissioner, before or at the time the present system of water was established?

A. I wasn't health commissioner at the time.

Q. That's what I mean?

A. No.

RE-DIRECT-EXAMINATION,

By Judge Springer.

Q. Has there been any decrease or increase in the death rate from typhoid fever among those persons who reside on the immedate banks of the river or in house-boats on the river who use the water of the Illinois river?

MR. JEFFRIES: I object to that for the reason that it assumes that the persons referred to in the question use the Illinois river water for drinking and domestic purposes, without any proof of that fact.

6012 A. I don't know of any case of that kind during my incumbency in office, I haven't known of a case.

Q. State whether there has been any increase or decrease of malarial diseases among that class of people?

A. As to that I wouldn't be competent to answer, because I am not familiar with that; I haven't had any experience with those people.

Q. During the time you were health officer, state whether deaths from typhoid fever were reported officially to the Board of Health?

A. Every case. While I was in office there wasn't a body buried without a permit and the cause of death.

Q. Dou you know among what class of people, if there is any distinction, these cases of typhoid fever originated?

A. No I do not know of any distinction. The fact of the matter is gentlemen, I didn't know anything about this hearing.

RE-CROSS-EXAMINATION,

By Mr. Jeffries.

Q. You say there has been no increase in typhoid fever since the opening of the drainage canal, while you were health officer?

A. There hasen't been.

Q. You stated you didn't know of a single case?

6013 A. I stated I didn't know of a single case on the river bank.

Q. Where they used the water?

A. Where they used the river water.

Q. Now does that answer apply both to the conditions that existed prior to the opening of the canal and since the opening of the drainage canal, the three years that you were health commissioner?

A. Yes sir.

FRANK C. BOURSCHEIDT, M. D.

6014 HENRY B. OCKER,

called as a witness in behalf of the defendants, being first duly sworn by the Commissioner, was examined in chief by Judge Johns and testified as follows:

Q. State your name, residence and occupation?

A. Henry B. Ocker; I live in Peoria, in the city, and I am a land agent by occupation.

Q. Were you ever engaged to take samples of water in the Illinois river?

A. Yes sir.

Q. By whom?

A. By Dr. Long of Chicago.

Q. When?

A. Well I can't say as to that; I think it was in 1900 though.

Q. At what point in the river were you engaged to take the samples?

A. Below the city, just opposite Wesley.

Q. Is Wesley above or below Kickapoo Creek on the river?

A. It is below Kickapoo creek.

6015 Q. How far below the city of Peoria is Wesley?

A. Well, I would say a mile and a half.

Q. Do any of the sewers of the city of Peoria enter the river below Wesley?

A. None that I know of.

Q. At what point in the river were you to take the samples?

A. Opposite Wesley.

Q. In the center of the current, or at the side?

A. In the center.

Q. Did you know of the fact of the opening of the drainage canal? Did you know that it was opened?

A. No, I don't think I did.

Q. Do you know whether the samples that you took were taken before or after the drainage canal was said to be opened?

A. I think I have taken some before and some after.

Q. How many different seasons did you take samples?

A. Well I can't state that even; it is so long ago and I didn't pay no attention since, and it has slipped my mind.

Q. Did you take them in two different years or one?

A. I kind of think it was in two different years.

Q. How often did you take samples?

A. I believe once a week.

6016 Q. What were your instructions as to the manner of taking samples?

A. Dr. Long showed me how to take them by taking me out in a boat and I should submerge the bottle at least a foot under the surface and let it fill and the smaller bottle should be submerged under the surface and filtered in. If I remember right, there was a cloth over the mouth of the bottle and we should let the water seep into the small bottle.

Q. At what depth below the surface did you take the sample?

A. About a foot; I reached down about that far (indicating) under the water.

Q. How many samples did you take each?

A. Well there was a double case and there was a large bottle and a small one, one in each case, and the large one and the small one were taken at the same time and shipped to Chicago at the same time.

Q. From whom did you obtain the bottles?

A. They were sent to me by Dr. Long by express from Chicago and I got them from the express office.

Q. When you took the samples, did you have a thermometer?

A. Yes sir.

Q. What did you do with the thermometer?

A. Took the temperature of the air and the temperature of the water.

6017 Q. At the same time you took the samples?

A. Yes sir.

Q. After you had filled the smaller bottle with water, what did you do with it?

A. I placed it in a can; I then sealed that can up and placed it in a larger can, and then packed ice and excelsior around it until the can was filled.

Q. After you had filled the larger bottle with water, what did you do with it?

A. Put it in the other side of the box and packed excelsior around it to keep it from breaking. That was all there was to that.

Q. How did you close the mouth of the bottle?

A. The large bottle?

Q. Both bottles?

A. Why there was a glass stopper if I remember right, and I think a cloth over it and a rubber around that to keep it tight.

Q. Did you cover the stopper after you had placed it in the bottle with a cloth, and fasten it there with a rubber?

A. Yes.

Q. When you took the samples did you make any ticket or do any writing?

A. Yes sir, sometimes.

6018 Q. What did you write upon the ticket?

A. I would put the temperature of the air and the temperature of the water, and I think I put the dates on and the name of the taker and the location where it was taken I believe, and I think who it was consigned to if I remember right. I don't remember about that.

Q. Is Wesley sometimes called Lower Peoria?

A. No sir.

Q. Where is the place called Lower Peoria?

A. In the south end of this city.

Q. On which bank of the river ,east, or west, is Wesley?

A. Well I don't know that it is either; I think it is on the south bank there, from the way the land lays—well it is I guess southeast probably.

Q. Is it on the same or the opposite side from Peoria?

A. It is on the opposite side.

Q. Is that part of the river opposite Wesley sometimes called Lower Peoria?

A. Well I don't know as the part of the river is. The city just above it there is what is called Lower Peoria.

Q. Do you know whether any samples of water were taken at a place called Lower Peoria, by any other person?

A. No, I do not; I was told though by the party that used
6019 to take me out in the boat to take the samples, that someone took them on the opposite side from where I did, but whether this was true or not I couldn't state.

Q. If anyone did take samples on the opposite side, do you know whether he was employed by Dr. Long or by some other person?

A. I do not know; I couldn't state.

Q. After you had placed the rubber over the mouth of the bottle, did you place any seal upon the bottle?

A. No, I think not, but I placed the seal on the can that the bottle was in.

Q. What kind of a seal was that?

A. We used sealing wax and I had a stamp; I think it was either 6 or number 9, that I stamped on the wax; I suppose that was my number as a water-taker.

Q. Have you now defective eye-sight?

A. Yes sir, very defective.

Q. Can you now see to read?

A. No sir.

Q. At the time you took these samples, what was the condition of your eye sight then, could you read and write then?

A. Yes, I could read and write, not like others but yet I could read and write for a certain length of time until my eyes would tire and give out.

6020 A. At the time you took these samples, did you do the writing upon the tickets yourself?

A. I did on some and others I didn't.

Q. Did you have some person assisting you in taking the samples?

A. Yes sir.

Q. Who was that person?

A. That was a young man by the name of Harry O'Reilly, my brother-in-law.

Q. When you did not write the tickets yourself, who wrote them?

A. Harry O'Rielly.

Q. After the writing was done upon the ticket, was it put in an envelope?

A. Yes sir and attached it to the box,—or I think it was attached to the neck of the larger bottle.

Q. In what way?

A. By a cord.

Q. What time in the day did you take the samples?

A. In the afternoon, probably in the neighborhood of three o'clock.

Q. After the samples were taken and packed in the box what did you do with the box?

A. Took it to the express office.

6021 Q. Where?

A. I think it was the American Express office here in this city, and sent it to Dr. Long.

Q. How long from the time the water was put in the bottle until you delivered the bottle at the express office?

A. It might have been an hour at the most.

Q. When you delivered the box at the express office did you take any receipt from the express company?

A. Yes sir.

Q. I have in my hand here forty-two tickets, on which your name appears—can you see to identify them?

A. No sir.

Q. When you delivered the boxes to the express company and took receipts, what did you do with the receipts?

A. I saved them in case any box got lost that I would have something to show that I sent the box, the sample.

Q. I have in my hand here fifteen receipts of the American Express Company which you handed to me this morning; are those the receipts which you received from the company?

A. Those are the ones; but I had more; I should have had more but I lost them or wore them out carrying them in my pockets.

Q. Do you remember whether the person to whom these boxes were shipped was named J. H. Long?

6022 A. The name was Long—Dr. Long.

Q. Do you know whether his name was John H. Long and whether you shipped them to a person of that name?

A. I don't recollect what his initials were, or his first name. I sent them to Dr. Long, and I think to his laboratory is where they were directed.

Q. Are these papers which I have in my hand and which you delivered to me this morning a part of the receipts which you received from the express company?

A. Yes sir.

JUDGE JOHNS: I now hand the Commissioner forty-two tickets bearing the name of the witness and ask that the Commissioner mark them State of Illinois Exhibit No. 12, for identification, to witness Henry Ocker's testimony.

Received and so marked by the Commissioner.

JUDGE JOHNS: I now hand the Commissioner an envelope containing fifteen receipts of the express company, and ask him to mark them State of Illinois, Exhibit No. 13, to the testimony of witness Henry Ocker, for further investigation.

Received and so marked by the Commissioner.

6023 CROSS-EXAMINATION,

By Mr. Jeffries.

Q. Did you say you were assisted in this work by someone?

A. Yes sir.

Q. And that was your brother-in-law?

A. Yes sir.

Q. Where does he live?

A. He is residing on the corner of Webster and Smith Streets in this city.

Q. Who took the temperature of the water and of the air?

A. I did sometimes and he did sometimes.

Q. Was your sight sufficiently strong at that time for you to take the temperature?

A. Yes sir.

HENRY B. OCKER.

6024 S. P. BARTLETT,

caled as a witness in behalf of the defendants, being first duly sworn by the Commissioner, was examined in chief by Judge Johns and testified as follows:

Q. Captain, state your name, residence and occupation?

A. S. P. Bartlett; residence Quincy, Illinois, and my occupation is Field Superintendent United States Fish Commission.

Q. How long have you occupied that position?

A. About thirty-one years. I will state also that I am one of the Board of State Fish Commission, and have served consecutively for 24 years.

Q. When was the State Fish Commission organized?

A. 1877.

Q. Have you been almost continuously since then a member of that commission?

A. I have been almost continuously a member of that commission except during the Altgeld administration, when I was superintendent. I have been acting in that capacity during that time.

Q. What are your duties as an officer of the United States?

A. My duties as the Field Superintendent of the United States Fish Commission, are a Field Superintendent, that 6025 is to say, having oversight under the direction of the U. S. Fish Commissioner of their out-lying stations, but as a matter of fact they have turned my services over to the State of Illinois, the work being very similar so far as the distribution of fish is concerned.

Q. Have you under your charge an institution for the hatching and propogation of fish?

A. No sir, in the State of Illinois there are no artificial places for fish propogation, but we have retaining ponds under the supervision of the government and of the state, in which fish collected from the over-flows and left by the receding waters, are rescued, the gamier fish preserved for distribution, and the residue placed in the deeper waters.

Q. Where are these retaining ponds?

A. At Meredosia.

Q. What are your duties as a member of the State Fish Commission?

A. The collection and distribution of indigenous fishes; the management of their floating property; that is to say their boats.

Q. What have you to do if anything, in regard to the enforcement of the law?

A. Only in an advisory position in connection with my colleagues.

6026 Q. As a member of the State Fish Commission are you active or are you a passive member?

A. Active.

Q. The operation of the Fish Commission in the enforcement of the law is generally under your personal direction?

A. The active work of collecting and distributing the fish is directly under my superivision and the enforecement of the law directly under the superivision of my colleague, Mr. Cohen, but the work of the two are very closely intermingled.

Q. Prior to July, 1903, were there under the Fish Commission fish wardens along the Illinois river?

A. Yes sir.

Q. How many?

A. Prior to 1903, they would average one to each county, and perhaps two or three that had entire jurisdiction of the river. I should think in all perhaps, along the river, 25 or 30.

Q. How many men are in the employ of the Fish Commission of the State of Illinois?

A. In all work?

Q. Yes.

A. Well during the summer season, catching the fish, distributing them the operation of the boats and the wardens, prior to 1903, I should think perhaps 150 people.

6027 Q. How is the operation of catching fish conducted and at what places?

A. Well the whole length of the Illinois river. The smaller fish are taken from these low flat ponds by the use of small mesh seines; the seine is drawn to shore, the better qualities of the fish selected for distribution, that is to say to be carried to the retaining ponds, and the surplus, coarse fish and other fish put into the nearest deep water, be it lake or river.

Q. In the course of your business have you become familiar with the Illinois river from LaSalle to Grafton?

A. Yes sir, I have been intimately associated with it for over thirty years.

Q. Prior to the opening of the drainage canal, what was the character of the current of the Illinois river?

A. Well, that would depend upon the season of the year. In the early spring and after the snow and water had reached the river, the current at times would probably reach a mile or a mile and a half an hour; of course being swifter in places. Later in the season when the water was lower, it has been frequently impossible to tell which way the current was going, by an object on the surface; it was very sluggish, very slow.

Q. How many dams are there on the Illinois river between LaSalle and Grafton?

6028 A. Four.

Q. Commencing at the upper part of the river, name the dams in their order and give as nearly as you can the distance between the respective dams by river?

A. Well the first dam is at Henry; the next is the Copperas Creek; that would be close to seventy miles I should think—I am giving you this now in a general way. I don't know that that is correct. The next dam would be LaGrange Lock; that I should think would be close to 60 miles—fifty-five or sixty. The next will be Kampsville; I can't give you the exact distance but probably about the same, 55 or 60 miles.

Q. How many and which of these dams were erected by the government of the United States?

A. The first two in order that is to say Henry and Copperas Creek were built by the State of Illinois. Those at Kampsville and LaGrange were built by the United States.

Q. What was the effect of these dams upon the current of the Illinois river prior to the opening of the canal?

A. Well, that again would depend upon the stage of the water; in very low water it would have the effect of making the current of the river very slow. At very high water, there would be perceptibly no effect.

Q. During low water periods, have these dams the effect of backing up the water and creating pools above the dams?

6029 A. In very low water always; of course there is always a flow over the dam, but the effect would be to make slack water at a very low stage of water. That is the purpose of the dams.

Q. Prior to the opening of the drainage canal what was the condition of the waters of the Illinois river between LaSalle and Henry dam?

A. Well, the water was about on the average of river water. In high water reasonably clear; in low water there would be the incidental amount of vegetable growth and more or less impurities.

Q. Is LaSalle the head of navigation on the Illinois river?

A. Yes sir, practically the head.

Q. How far from LaSalle by river, to Henry dam?

A. Well it is about 45 miles.

Q. Do you know whether prior to the opening of the drainage canal there was an odor in summer in the water above the Henry dam?

A. Well there was an odor more or less as I remember it. It was given off as all low water does; it was from decayed vegetation and refuse matter dumped into it.

6030 Q. Do you know of the condition of the water above Henry in the winter when the river was frozen over and its effect upon the fish?

A. Well, that varies at different seasons. I have seen the stage of water so low in the Illinois river during the winter season, that the fish would perish under the ice during the winter.

Q. To what did you attribute that?

A. Well, the ice becomes very thick and covered with a heavy blanket of snow it stops the introduction or escape of any air, and the water I think becomes bad, it forms noxious gas under there which is very destructive to fish and other life. The water becomes impure.

Q. What was the condition of the fish between LaSalle and Henry before the opening of the drainage canal, as to their strength and quality.

A. Well that would vary with different seasons. I have seen seasons when they were very sluggish and very soft, and then again in the spring of the year when there was a heavy flow of water the fish would be nearly up to the average.

Q. You may state whether they died in the water; prior to the opening of the drainage canal, above Henry?

A. Oh yes, I have known fish to die there previous to the opening of the canal for many seasons.

6031 Q. Are fish very susceptible to the condition of the water in which they live, and easily and rapidly influenced by it?

A. Yes sir. It is nothing uncommon to find fish taking on a coloration from the character of the water that they are in.

Q. You may state if you know, whether or not fish will vary in their color that is, in their natural color, according to the condition of the water in which they are found?

A. Yes sir, the temperature and condition of the water have a very material effect on the coloration.

Q. Are their colors bright and quite distinct when the physical conditions of the fish are low and bad, or indistinct, or lighter?

A. Well, it is very distinct. There can be no mistake in it.

Q. As compared with fish in a strong, healthy condition, which have the brighter or more distinct color, the strong fish or the weak fish?

A. The strong fish always has a dark, bright color.

Q. Since the opening of the drainage canal, what has been the condition of the Illinois river above Henry dam?

A. Why judging from personal observation of it and going over it frequently, my judgment would be that the water shows a decided improvement in every way.

Q. Since the opening of the canal, have there been odors in the water above Henry?

6032 A. Well I can't state as to that. I can only judge of the water as I see it. I have no particular knowledge of it, as in some of the former seasons; that is to say the complaints of dead fish have not reached me, so I have had no occasion to investigate.

Q. Since the opening of the drainage canal, what has been the condition of the fish in the Illinois river between LaSalle and Henry?

A. Well, I know of no complaint; they are way up to the average.

Q. Before the opening of the drainage canal, what was the condition of the Illinois river between Henry dam and Peoria Narrows?

A. Why it depended entirely upon the season of the year. I have seen very good water in the spring and very bad water at low stages.

Q. Is the place called the Narrows on the Illinois river above Peoria?

A. Yes sir.

Q. So far as you know, is that place above the sewage discharge of Peoria?

A. Yes sir, I should think it was.

Q. In the stretch of river between Henry and Peoria, state what you know with reference to the vegetable growth

6033 before the opening of the drainage canal?

A. It would be probaly better to say that these vegetable growths are due as a rule to the outgrowth of low water and the high temperature, and I have almost every season, when we have had a low stage of water, found a large amount of vegetable growth on the surface, and moving backwards and forwards with the change of the wind.

Q. As the season advances to the winter what becomes of the vegetable growth in the Illinois river?

A. Well if there is in any way a large amount of it and the water is very low, decomposition takes up a great deal of it, and a great deal of it is consumed by vegetable consuming fishes and aquatic birds. In very low water a great deal of it is left upon the shore and decomposes which is frequently the cause of a great deal of bad odor.

Q. Does the vegetable growth in the Illinois river pursue the usual course of aquatic plants, come to fruition, form seeds, deposit them, and then die and decay?

A. Well I don't think I can answer that question scientifically.

Q. Does the vegetable growth in the river decay each year?

A. Yes sir.

Q. And is it renewed the next year?

A. Yes sir.

6034 Q. After the opening of the drainage canal, what was the condition of the Illinois river between Henry and Peoria Narrows?

A. My observation has been that the water was very much better, clearer.

Q. How about the vegetable growth in the river?

A. Well there has not been nearly as much of it, for one reason I think, on account of the greater volume of water.

Q. What about the temperature of the water?

A. The temperature has been lower.

Q. The water has been cooler?

A. The water has been cooler.

Q. What has been the condition of the fish between Henry and Peoria?

A. I have heard of no complaints; they seem to be in good merchantable condition.

Q. At Peoria, are there foreign substances deposited in the river and if so from what sources?

A. Yes, from all sources. The sewage is very large, and the refuse from the gas houses and distilleries and glucose factories, is immense.

Q. Is the amount of this deposit of foreign matter large or small at Peoria?

A. Very large.

6035 Q. Below Peoria have you noticed this foreign matter in the water?

A. Yes sir, in great quantities.

Q. In what form?

A. Well, in various forms. Principally the large deposit of offal from the distilleries and from the cattle pens breaking off and falling into the river in large masses; in the immense amount of sewage that collects at the river front during an east wind, driving it all onto the shore, or rather keeping it all on the shore, and particularly in the operation of the seine in collecting the fish. We find a very heavy, offensive deposit on all the shores along the river and the flat lakes adjoining.

Q. What was the character of that deposit?

A. Well, it looks like a greasy substance, a slime, I might call it, a very heavy slime; it is very offensive when brought to the surface. I am talking now about below Peoria.

Q. Yes and before the drainage canal was opened?

A. Yes.

Q. How far down the river below Peoria, did this condition of pollution exist?

A. Oh, I have met it frequently as far down as Havana, in limited quantities of course.

Q. How far is Havana from Peoria by river?

A. It is pretty close to seventy miles. I am talking
6036 of this floating substance on the water now, these islands.

Q. Did the water below Peoria, before the opening of the canal, have a scum upon it?

A. Yes, I have seen a very heavy scum on the water below Peoria and at Peoria.

Q. To what did you attribute that?

A. Well, I believed it to be the sewage and refuse from these places at Peoria.

Q. How far down the river did that extend?

A. Well, that didn't go down very far. I have met with that at Pekin, and below perhaps. It was a kind of a broth; it looks like grease on top of the water.

Q. Since the opening of the drainage canal, what has been the condition of the water below Peoria, and as far as Pekin?

A. Why I have seen some floating stuff in the river, but nothing like as bad as it was in previous years, previous to the opening of the canal. I probably, with your permission could give reasons for that, in my opinion.

Q. Yes?

A. This particular refuse from the gas works and distilleries and glucose works is run off in spouts at the edge of the water and it is allowed to accumulate there and when the very low water comes, it breaks off and floats off with the current. 6037 That would be an impossibility if the stage of the water was of sufficient height to keep the shores clean. Previous to the introduction of the canal, we had almost uniformly a much lower stage of water than after the introduction of the water from the canal, and I attribute the absence of it now some to the better condition of the water, and the swifter current, than in previous years where it was allowed to accumulate there during very low water and break off and float away.

Whereupon an adjournment was taken until 1:45 P. M., same day, Thursday, August 13th, 1903.

6038 National Hotel, Peoria, Illinois, August 13, 1:45 P. M., Thursday, August 13, 1903. Parties met pursuant to adjournment.

Present, the Commissioner and same counsel representing the respective parties.

S. P. BARTLETT,

resumed the stand for further direct examination by Judge Johns and testified as follows:

Q. How far below Peoria prior to the opening of the drainage canal have you seen the substance cast into the river at Peoria, floating?

A. Well the best of my recollection is that I have met it coming up the river in a boat, just above Havana. If my recollection serves me right, it was just above Havana; but it was not in great quantities nor in large pieces.

Q. What was the condition of the fish in the Illinois river before the opening of the canal below Peoria as far as Copperas Creek dam?

A. Well, there were a good many seasons when the fish have been considered bad. When I say bad, I mean they would die in the water without apparent cause; you would see them floating.

6039 Q. Are there many lakes below Peoria and above Copperas Creek dam which have natural connection with the river?

A. Yes sir, there are a number of them. The lake containing the greatest area is Spring Lake, that has an opening into the river large enough to carry steamboats in and out. This is a canal cut from the river into the lake at the expense of the state to enable the farmers living along the bank of Spring Lake, that is the bluff side of the lake, to load their wheat and corn out into the river and bring it out into the river to Peoria or above or below as the case may be. This lake covers an area of, I should think, without computing it seven miles long to about three miles wide, and it is fed almost entirely by springs.

Q. In periods of low water, you may state whether the water from Spring Lake runs out through this canal into the river?

A. It has two ways of escaping from Spring Lake; when the river is rising, the water runs in; when the river is falling the water runs out ordinarily; but at its lower end the water has been raised a number of inches perhaps feet, by an abutment that has been thrown out from Copperas Creek dam to the bluffs and that is used as a road to and from the lock. The water flows over this road in places, varying in depth of course with the height of the river.

6040 Q. Prior to the opening of the drainage canal, how was it affected by this cast off matter from Peoria and Pekin?

A. Very materially. If the river was raising, and at such times this stuff woud break off from the shores very easily, it is taken in great quantities into this lake; in fact I have seen it in bulk sufficient in the canal to absolutely prohibit the going in with our boats, we had to break it up before we could get by. That floats off into the lake and that with other impurities makes the lake very foul at times.

Q. Since the opening of the drainage canal, what has been the condition of Spring Lake?

A. Well, I can only tell by comparison. I probably had best explain the conditions that existed and then the conditions as I understand them today. If it is permissible I will do that.

Q. Yes.

A. A number of years ago we had occasion to take some small fish out of the lake which lay immediately below this abutment, and going to and from the lake we used this road. The foreman of the fishing gang called my attention to the fact that there was a great many small bass on the upper side of this road, which would be in Spring Lake, and also to the fact that they seemed to be suffering; that is, the heads of the
6041 fish were out of the water trying to get oxygen. I ordered the men to go in and make a haul and see what they could find. In the meantime I went over to the steamboat to look after the collections already made, and on going back I found the men on the road, two of them absolutely sick. The accumulation next to this road which forms a kind of a dam was anywhere from 18 inches to two feet and a half deep, perfectly black and the stench so fearful and nauseating that the men couldn't stand it at all. From that I made a personal examination of a great deal of the lower end of Spring Lake, particularly the little pockets that had been filled up with water from the higher water, and cut off by the receding water. And I had them investigate the conditions in all of these pockets, or a great many of them; not all of them. I found the bottoms of those ponds frequently eight inches deep with this black slime, where there was only six or eight inches of water. This is at the lower end of that lake. I took occasion to go over the ground several times in later seasons and have always found a very bad state of affairs there.

Q. Where is the artificial canal leading into Spring Lake, with reference to Copperas Creek dam?

A. It is about four miles above on the east side of the river.
6042 It runs east about two miles through the—what we call the island itself, and then it takes a reflex across what is

known as Mud Lake which has been dredged to make a channel, and then out into the deep water of Spring Lake.

Q. Where in the state of nature was the natural outlet with reference to Copperas Creek dam, of Spring Lake?

A. The natural outlet would be some two miles below; the outlet is now cut off by this dam.

Q. If it were not for this abutment from Copperas Creek dam where would the natural outlet of Spring Lake be?

A. About a fraction over two miles on the east side of the river below Copperas Creek dam.

Q. This material which you found in Spring Lake above this abutment, how did it reach the lake and get into it?

A. Why it must have gone naturally through that canal or in seasons of higher water, through some of the sloughs which led into there.

Q. The material which you found below the abutment, could it have gone over the abutment, or gone through the woods to the channel of Spring Lake?

A. Why it must have gone over the revetment of course; but of course there was not so much found below as above.

Q. How long was this investigation before the opening
6043 of the canal?

A. Well, I think the last work of collection that we did from those lakes was in 1897 or 1898, I won't be positive of the year; the last year we ran the Lotus.

Q. Now since the opening of the drainage canal have you made inquiry into the condition of Spring Lake both above and below the revetment?

A. Yes sir, I have made a good many investigations of Spring Lake. We have made no collections there, but I have spent a good deal of time on the lake looking after the condition of the fish.

Q. Well, what has been the condition since the opening of the canal?

A. Well, again I will have to go back a little bit and make an explanation so you can understand the conditions. At that season of the year the weather was warm, and the boat lay at Copperas Creek dam, and I took occasion to make a critical examination of a number of the black bass brought in by those

who had been fishing on the lower end of Spring Lake, to satisfy myself as to the fish themselves. I found in a great many instances the fish very soft and I took occasion to open them up and found that the whole of the interior of the fish absolutely
dissolved—from what cause I am not prepared to state
6044 further than a few days later, a great quantity of black
bass were floating upon the water in the lower end of the lake and a postmortem disclosed the same state of facts, that all of the digestive organs of the fish had been absolutely dissolved; the fish died of course. I had no means of making an analytical examination of the liquid, but I was satisfied as far as I could be from observation that the cause of death was the very impure state of the water at that time.

Q. When was this, Captain?

A. That was about ten years ago; I can't remember dates; it was during one of the years that we collected there. It was previous to 1897, I think.

Q. On this occasion where you found the men sickened from making a haul of fish in 1897, above the revetment of Spring Lake, in what condition did you find the fish?

A. Well, my attention was called to it first by the very large quantity of fish evidently sick and suffering. The condition was bad right there.

Q. Since the opening of the drainage canal?

A. Since the opening of the drainage canal I do not believe that there has been a season when any dead fish have been found upon the lake. My own particular observation of that locality is that the water is very much clearer, and a personal examination of the bottom, while it shows quite a deposit, is
very slight as compared to the season of which I speak.

6045 Q. Before the opening of the drainage canal, what was
the condition of the water in the Illinois river between Copperas Creek and La Grange?

A. Well, it was just about as the river would naturally average at low water. At low water there would be a great deal of vegetable growth and in places a good many fish would die from the high temperature the water attained, and the decaying vegetable matter; this is along in Stewart Lake. I have noticed that where the plant life and vegetable life was thrown down the water became hot and it commenced to decay and a great many fish died in consequence. Stewart Lake is between those points named.

Q. Since the opening of the drainage canal?

A. Well, the condition has been that since the opening of the drainage canal of course there has been a very much greater volume of water; the water has been very much better; I have noticed a very great decrease in vegetation of various kinds. The best evidence that we have—if you will permit me to express it—of the increased betterment of the water at points below Copperas Creek, is the fact that there are more black bass in the river this year than I have ever known.

Q. Before the opening of the drainage canal, what was the condition of the water in the Illinois river between La Grange and Kampsville dam?

A. Well, I think the water as a rule, except in very low
6046 water classed as fairly good. In very low water of course
the same objections exist.

Q. Are there lakes and ponds in the bottoms of the Illinois river between La Grange and Kampsville?

A. Yes sir, a great many lakes and bayous and sloughs and bays. It is simply interwoven with water.

Q. Now have you dragged those lakes and bayous with seines for the purpose of getting fish before the opening of the canal?

A. Oh yes, the men have worked practically the whole length of the river.

Q. In what condition before the opening of the drainage canal were these lakes and bayous between La Grange and Kampsville, as to foreign substances, etc.?

A. Well, everything depended upon the season and conditions. Some seasons of course the water became very bad from decaying vegetation and very foul, and very destructive to fish life, and again in other seasons when the water would be high, it would be practically free from that down, that far down the river.

Q. Since the opening of the drainage canal, what has been the condition of the water between La Grange and Kampsville dam?

A. In my opinion, good.

6047 Q. What has been the condition of the fish between La Grange and Kampsville since the opening of the canal?

A. They have been good; in fine condition. As I stated a moment ago, there are more black bass—who are only habitats as a matter of choice, of clear water—in the Illinois river than there ever were before. I am speaking of the river proper now.

Q. What has been the condition of the ponds and bayous between these two dams since the opening of the canal?

A. Well, they have been higher and the water, and the fish propagate better.

Q. How far is it from Peoria by river to Kampsville dam?

A. About 125 miles, I think. Now in giving these distances, I am giving them to you off hand, without knowing exactly.

Q. From Kampsville dam to Grafton is how far by river?

A. Well it must be close to forty miles—forty-five miles.

Q. What is the condition of the river below Kampsville since the opening of the drainage canal?

A. It has been good.

Q. Between LaSalle and Peoria, you may state whether or not the character of the water improved, as it did on the river?

A. Yes sir, until we get to Peoria Lake, we get a practically good water.

6048 Q. Between Peoria and Copperas Creek, state whether or not the character of the water in your judgment improves as you get close to Copperas Creek?

A. Yes sir.

Q. Is the water in the Illinois river below Peoria, and down to Copperas Creek better or worse than in Peoria Lake?

A. Well, I think the water below Peoria, from Peoria to Copperas Creek dam is worse than Peoria Lake considerably; very considerably. Except under extraordinary conditions; there is very rarely a better body of water found anywhere than in Peoria Lake.

Q. How does the water below Copperas Creek and down to La Grange dam compare with the water above Copperas Creek?

A. I think it gets better all the time as you go further below, a great deal better. A man doesn't have to be an expert to notice that; you can see that all the time; the character of the water is better as you go down.

Q. From your experience on the Illinois river, what is your judgment as to its purifying itself as it flows from sources of impurity at Peoria and Lockport?

A. Well, in my judgment, where the water is sufficient to make the current carry the water along; but whenever it is held in suspension in the water long, there is no question but what it is a source of great purification.

6049 Q. How many dams were there in the Illinois river in 1877, when you commenced your duties as fish commissioner?

A. Two completed.

Q. What were they?

A. Henry and Copperas Creek. I think that one at La Grange was in course of construction.

Q. Describe the Illinois river in 1877 as to its size and depth and current?

A. Well, the river as I remember it in my first trip over it in 1877 on my own boat, doesn't differ very materially from its present outlook as to height. We found plenty of water. As I recollect it the water was very high all over the whole country. It was what steamboatmen would call a big river. Through the season, as I remember it, that fall we had very low water. The same condition of things existed then as have existed ever since. I remember very well seeing a calf wade the Illinois river at Meredosia that season. The river was filled with water plant and grass so that it would tangle up the oars, and the stench coming off of the river I have been told by those who lived at various points on the river, was of such a nature that when the wind blew from the river to their residences, it compelled them to change their quarters and go away from it. That was at a very low stage of water I am talking about now, and, as I recollect it, that was the year.

6050 Q. When were the other two dams put in by the United States Government?

A. I do not recollect the years which they were opened; I think that at La Grange was in course of construction at that time, and finished several years later, and this one at Kampsville has only been opened to the public five or six years. I don't think it was fully completed until five years ago.

Q. Prior to 1885, were you familiar with the Illinois and Michigan Canal?

A. Well, not intimately; I had been over it once or twice.

Q. Were you aware that in 1885, the city of Chicago commenced to pump water from the Chicago river into the Michigan Canal?

MR. JEFFRIES: Objected to as incompetent and immaterial, and as furnishing no excuse or justification for the turning of the sewage of Chicago into the river through the Chicago drainage canal.

A. Yes sir.

Q. Into what did the Illinois and Michigan Canal empty its waters?

A. Illinois river.

Q. What effect upon the Illinois river did the pumping of water into the Illinois and Michigan Canal and its subsequent emptying into the river have upon the character of the water in the Illinois river?

6051 MR. JEFFRIES: Objected to for the same reasons.

A. Well I am not prepared to state just what the effect was on the river itself.

Q. If it apparently enlarged the Illinois river and increased the current in it, you may state to what extent?

MR. JEFFRIES: We object to the question for the reasons stated in reference to a previous question and for the further reason that the counsel is undertaking to cross-examine his own witness after he has stated himself that he was not prepared to testify upon that subject.

A. Well I can't state intelligently as to that because I really don't know.

Q. What effect upon the Illinois river as to its size, current and general appearance, has the opening of the drainage canal and the consequent emptying of the waters of the drainage canal into the river had upon the river in a general way?

A. It has increased its volume very materially; it has accelerated the current.

Q. Have you an acquaintance with the fishermen upon the Illinois river?

A. Yes sir, a very large acquaintance.

Q. From La Salle to Grafton?

A. From Grafton to La Salle, yes sir.

Q. In your judgment how many people are engaged in 6052 the business of fishing for commercial purposes?

A. May I ask whether you mean directly or indirectly?

Q. Well directly, first, on the river?

A. My impression would be that there is anywhere from 2500 to 3500 people directly interested in fishing themselves; that doesn't include, however, the helpers. I am talking about the men who fish.

Q. How many people are engaged in the preparation of the fish for market and the shipping of them after they are caught?

A. Including the fishermen themselves?

Q. Yes.

A. Well I should think 5000 would be a fair estimate. Now I am talking about the men who make the boxes, ice them, and draying to the cars and all that.

Q. Does the business of this population bring these men upon and about the water during the fishing season?

A. Yes sir.

Q. What was the condition of health of this class of men prior to the opening of the drainage canal as to typhoid fever and malarial fever and malarial diseases?

A. Well I can only speak of that in a general way and as to my own men particularly. We had a great deal of 6053 sickness; not much typhoid, but a great deal of very low grade fever; that in my opinion—well I was going to say as a physician,—but from what knowledge I have of it,—owing to a very bad state of the water during low water.

Q. Were you educated for a physician and did you at one time practice medicine?

A. I never practiced medicine, I was educated and graduated as a physician—too poor.

Q. Since the opening of the drainage canal, what has been the condition of the health of the people engaged in business upon the Illinois river in the fishing industry?

A. My observation has been that there has been a very great decrease in typhoid and intestinal diseases.

Q. Do you know of typhoid fever among the people engaged in fishing in the Illinois river since the opening of the drainage canal?

A. Again only as applied to my own men. I know the condition of their health, after that and previous to the opening of the drainage canal. Of course I have heard a great deal from the different towns that I have come in contact with, but I do not know of it from my own knowledge,—of the difference in the prevalence of those diseases.

Q. From what you know and have heard, as a matter of general information along the Illinois river, what has
6054 been the condition of health of the people living along the river?

MR. JEFFRIES: I object to the question for the reason that it is incompetent, calls for hearsay evidence and evidence of the physicians of the community would be the best evidence, and any answer that might be given would be incompetent, immaterial and irrelevant, and for the further reason that the witness has not shown himself to be sufficiently acquainted personally acquainted with the general health of the respective communities to give an opinion on that subject, or to testify in respect thereto, so that whatever he might say will be based upon what other physicians have told him and therefore not competent.

A. My work as you know, carries me to almost every town along the Illinois river, and the natural tendency would be to drift in and talk over semi-professional matters with physicians. And I believe with one single exception—

MR. JEFFRIES: I object to what the witness believes.

A. (Continuing)—that every physician that I have talked to has commented on the decrease in typhoid and malarial fevers during the last two or three years.

Q. Taken as a class, what has been the condition of the health of the fishermen upon the Illinois river since the opening of the drainage canal?

MR. JEFFRIES: Object to the question because the
6055 witness has not qualified to testify on that subject.

A. I can only particularize as to my own men. I can't express an opinion as a whole.

Q. What has been their health?

A. Their health has been very vastly improved.

Q. From all your sources of information of whatever character, what has been the condition of the health of the fishermen on the Illinois river generally, since the opening of the drainage canal, in your opinion?

A. Well I should be inclined to say, from all sources of information, that it is a great deal better.

Q. How many people live upon the Illinois river in house-boats or upon the banks of the river immediately adjoining the water?

A. I don't believe such a thing as an exactly correct estimate could be made, for this reason: The Illinois river itself is only a small part of the water that is affected, or probably I might put in another way, is only a part of the whole river as a whole, taking in what we call the navigable portion.

Q. Including in the term "Illinois River" not only the body of water constantly flowing in its channel, but the waters of its bayous and lakes, how many people in your opinion, live upon the Illinois river?

6056 A. Well, my opinion is that there would be more than 5,000 people directly upon the river; that is to say in tents and flat-boats or in house-boats and on the sloughs and bayous and bays and lakes connected with the Illinois river.

Q. From all your sources of information and your personal knowledge, since the opening of the drainage canal, what has been the condition of the health of that kind of river population since the opening of the drainage canal?

A. Why, in my opinion, the health has improved. That from all sources of information that I have been able to discover.

Q. Is the Illinois river and its lakes and ponds much resorted to for pleasure fishing?

A. Yes sir.

Q. To what extent?

A. Well, to a very large extent. There is scarcely a town along the river that doesn't harbor during season an immense amount of strangers from other parts of the state who seek the Illinois river for sport annually; the citizens themselves take a good deal of pleasure out of it.

Q. What is the extent of the fishing industry— As to these people who use the Illinois river as a resort for pleasure and fishing, in what manner do they generally live, in camps or in hotels?

6057 A. Well the growth of interest in fishing and sport on the Illinois river, has been great, and almost every available lake on the river of any size has been taken up for a pleasure resort, and they build either club-houses on the bank or house-boats or as in the case at all of the locks, I believe I am safe in saying that a hundred can be found camping out there all season long for the purposes of fishing with a hook and line.

Q. Do the persons concerned in the fishing business and these pleasure fishermen use the water of the Illinois river for drinking and domestic purposes?

A. Well, I think they use it generally. Wherever they can they put down a drive well, but in a great many places that I know of they are now using the water for domestic and drinking purposes.

Q. Through what kinds of country does the Illinois river run?

A. The Illinois river is very peculiar in its formation, in that it has flat shores on both sides of the river. These bottoms extending from three to fifteen miles in width and filled almost in every case, with lakes and sloughs, aside from the river itself. As the fall is only a half inch to the mile, the overflows are very frequent and the lakes fill up and evaporate again several times during a season, during the dry seasons. The
6058 course of the river is inclined to be free from bars
and of a very even depth. The land on both sides of course on account of frequent overflows, is very much as nature left it.

Q. In times of extreme high water, what is the area covered by the Illinois river?

A. I can't answer that question specifically. The river in extreme high water will be of course from bluff to bluff, frequently twelve to fifteen miles wide.

Q. In times of extreme high water where is it narrowest, if you know?

A. Well, there are several real narrow places. One is right here at Peoria, and below Peoria a short distance is another one, and there are some down there after we get below Pearl, and then again after you get below Hardin. The character of the river changes there materially.

Q. In times of extreme high water, how wide is the Illinois river at the Narrows at Peoria?

A. Well in extremely high water there are practically no Narrows there, it is a regular lake; it extends from bluff to bluff.

Q. Does the Illinois river in extreme high water vary in its width and if so what are the extreme variations?

A. Well that of course will depend upon the height of the water.
6059 After the river has reached a certain height it couldn't vary.

Q. What I mean is, at times of high water, is it everywhere of equal width, or does it vary as the distances between the bluffs vary, and if so what is the variation in the distances between the bluffs?

A. Well, as I was saying a while ago, take it below Peoria here the bluffs are not very far apart.

Q. About what distance?

A. I should say in the neighborhood of three miles. As we go down further, down below Browning we have flat, low places on both sides of the river and I would say it would exceed twelve miles there. It does vary in width materially in very high water.

Q. Is the country immediately adjoining the Illinois river, in the arable lands, devoted to agriculture?

A. Yes sir.

Q. Do you know whether domestic animals adjoining the river are accustomed to drink of its waters?

A. Oh yes, all the time.

Q. Is the country adjoining the Illinois river abounding numerously with domestic animals which use the water?

A. Yes, the low-lands above Havana particularly, and a great many other places are used for pastures. Take Spring

Lake and a great many other places, are used for pas-
6060 tures during low water,—dry weather.

Q. You may state whether or not cattle are brought from distances in the seasons of low water for the purpose of being pastured on the low lands of the Illinois bottoms?

A. Yes sir. The land is rented for that purpose in a great many places.

Q. Are such animals watered from wells or do they use the waters of the Illinois river for drinking?

A. They use the water of the lake or the slough or whatever they happen to be located on, to drink, of course.

Q. Did you ever hear of a disease called anthrax, among the cattle of the Illinois river?

A. I have not amongst the cattle on the Illinois river, no. I have heard of the disease.

Q. Do you know or did you ever hear of any diseases among cattle drinking the water of the Illinois river which were attributed to the drinking of the water of the river?

A. No sir.

Q. Has it been before the opening of the drainage canal and is it since a good water for animal consumption and drinking?

A. I have never heard anything to the contrary; I believe it is.

Q. What in your opinion has been the effect as to the increase or decrease of fish in the Illinois river by reason
6061 of the opening of the drainage canal?

A. The increase in fish on the Illinois river has been very great in the last three years; but this is in part attributed to the fact that the stage of the water in the Illinois river has been at too great a height to permit the drawing of seines in the river itself. The character of the fish has been very much better.

Q. What is the extent of the fishing industry upon the Illinois river?

A. In 1901 the report of the Fishermen's Association which comprises an organization of about 1,000 men on the Illinois river, gives as a total of coarse fish caught, of nearly 18,000,000 pounds, with quite a per cent of fine fish added. The amount of money they report as having received for their output—I am giving you their figures now—a little over three quarters of a million of dollars. The bulk of this from coarse fish, a very large proportion of which were taken from the river proper, which would include Peoria Lake.

Q. Is there included in this estimate the fish caught by hook and line?

A. No sir, this is simply reports from the books of the Fishermen's Association and submitted to me under oath.

Q. From your knowledge and experience upon the river, and your connection with the fishermen do you believe 6062 these figures to be approximately correct?

A. Yes sir.

(Witness withdrawn for the present).

6063 WILLIAM H. BINNIAN, called as a witness in behalf of the defendants, being first duly sworn by the Commissioner, was examined in chief by Mr. Todd and testified as follows:

Q. What is your name?

A. William H. Binnian.

Q. What is your business?

A. Manufacturing.

Q. Manufacturing what, Mr. Binnian?

A. Agricultural implements and straw-board; I am connected with two companies in the city of Peoria.

Q. What are the names of the companies?

A. Acme Harvesting Company and the Peoria Straw-board Company.

Q. Do you hold any position with the Acme Harvesting Company?

A. I am its president.

Q. How many men are employed by that concern?

A. An average of about seven hundred.

Q. Do you hold any position in the other company?

A. President of that company also.

Q. How long have you lived in Peoria?

A. Forty-six years.

Q. During the time that you have resided here are you acquainted with the Illinois river?

6064 A. Yes, sir; quite well.

Q. What was the condition of the Illinois river before the opening of the drainage canal?

A. Well, we considered it a pretty filthy stream and quite sluggish.

Q. How did the condition of the river immediately above Peoria compare with the condition immediately below Peoria prior to the opening of the drainage canal?

A. Well, the river was very much more filthy below the city than it was above, on account of the refuse matter thrown in by the manufacturing plants on the river bank.

Q. What has been the effect of the opening of the drainage canal upon the quality of the water in the Illinois river?

A. Well, to all appearances it has cleared it up very materially, and practically we have found that it has been of very great benefit; that is particularly through the straw-board mill.

Q. Prior to the opening of the canal was there any odor connected with the water or emanating from the water?

A. Yes, practically all the time.

Q. What is the condition since in regard to odor?

A. I don't notice any at all.

Q. What opportunities have you had for observing that fact?

6065 A. Well, I presume I have been on the river on an average of forty or fifty times a year for forty years.

Q. Before the opening of the canal did you take your family on the river?

A. Under protest from them, once in a while.

Q. Since the canal was opened have you taken them?

A. I don't hear any objections.

Q. In the manufacture of straw-board in the plant over which you preside as president, have you noticed any changes in the water of the river for mechanical and manufacturing purposes since the drainage canal was opened, over conditions that existed prior thereto?

A. Yes, there have been some very manifest differences apparent.

Q. Will you describe in detail these differences?

A. Well, the chief point that we have observed has been in the saving of felts. Prior to the opening of the drainage canal, it used to cost us from 50 to 60 cents per ton of board for felts, and our average cost now is 27 cents per ton of board for felts.

Q. How is that economy effected in the use of water of the Illinois river?

A. To answer that question I will have to explain somewhat in detail the office that is performed by these felts.

6066 These felts are from 64 to 94 inches in width and about 100 feet in length. The office that is performed by this felt is to take up the pulp as it is gathered on cylinders which are covered with brass wire screen. There are four of these cylinders in each stuff-chest, or vats which hold the pulp from which the straw-board is made. The felts pass over each of these rolls in succession taking up the pulp that has accumulated on them and then in returning to position they pass through a vat of water in which they are washed up, so that when they come back to the first roll and again take up the pulp they are washed up clean.

Q. What kind of water is used that they are washed in?

A. River water.

Q. How long do these felts live?

A. The life of a felt now is about five to six weeks, when formerly it was but three to four.

Q. How did the effect of the water prior to the opening of the drainage canal manifest itself upon these felts?

A. It rotted them more quickly than the water now does.

Q. Can you give any reason for it?

A. Simply on account of the impurities of the water; the process is identical now with the process of ten or fourteen years ago; there has been no change in the method of operation.

6067 Q. Have you observed any change in the economy of the water since the opening of the canal over that which existed prior to the opening, in regard to your machinery?

A. Yes, our bills for repairs are much lighter than they used to be. The present water doesn't have so evil an effect on the valves and pipes as the old water had; they don't rot out so quickly; don't wear out as quickly.

Q. Is the Acme Harvesting Company a corporation?

A. Yes, sir.

Q. Have you any objection to stating the capitalization of the company?

A. Capital and surplus about a million and a half.

Q. Where is the water used in the harvesting plant secured for condensation and steam making purposes?

A. From the Kickapoo creek.

Q. Where does the Kickapoo creek receive its supply of water?

A. Well, from two sources I should say; from the back water of the Illinois river and from surface drainage up in the country.

Q. About what portion of the time does it receive its water from the backwater of the Illinois river?

A. I think half of the time, or over.

6068 Q. Was that true before as well as since the opening of the canal?

A. No, it probably didn't get as much backwater prior to the opening of the canal as they have since, because the stage of the water was lower then than it has been since.

Q. How does the water secured from Kickapoo creek when it is Illinois river water,—back water from the Illinois river—compare in its steam-making qualities in the harvester factory with that which is gotten from the Kickapoo creek under other conditions?

A. I don't believe I could give you an intelligent answer to that question because we haven't kept close enough records on it.

Q. Has there been any perceptible change when the source of the water has been different in the manufacturing plant?

A. I hardly think there has.

Q. What is your opinion as a manufacturer, as to the quality of the water in the Illinois river at present, for manufacturing purposes and the uses to which water is put in manufacturing?

A. Why, I am firmly convinced that it is far superior today than what it was prior to the opening of the drainage canal, by practical experience and scientific tests that have been made at both plants at times.

6069 Q. Without instituting a comparison with conditions that obtained prior to the opening of the drainage canal, what is your opinion as to the water today for manufacturing purposes?

A. I don't think it can be excelled; it is a most excellent water for manufacturing purposes, for steaming purposes. We use about two million and a half gallons of water per day at the straw-board plant.

Q. What becomes of the refuse from the straw-board factory?

A. It is thrown back into the river.

Q. What is the character of that refuse?

A. It is impregnated with lime and the washings from the cooked straw which takes off the silica and other refuse matter of the straw.

Q. Are there any chemicals mixed in with that refuse?

A. No, there are not; there are none used in the manufacture of straw-board except certain acids used in washing up the brass screens so as to keep them clean.

Q. Will you locate the two factories, the Acme Harvesting Company and the straw-board factory?

A. The Acme Harvesting Company is about five miles from the courthouse or a mile and a half from the lower city limits. The straw-board factory is in Averyville, or a quarter of a mile above the upper city limits.

6070 CROSS-EXAMINATION, by Mr. Jeffries.

Q. The Acme Harvesting plant is located down the river?

A. Yes, sir, below the city.

Q. And the plant of the straw-board company is located above the city?

A. Yes, sir.

Q. How far from the river is the Acme Harvesting Company?

A. Fully a mile.

Q. And how far is the straw-board company from the river?

A. About 300 feet.

Q. Do you know whether or not the impurities that you speak of as being in the water before the Chicago drainage canal was opened, so that they would rot the pipes, was of vegetable or animal matter?

A. Well, I do not; I simply know the results.

Q. You don't know the character of the impurities?

A. No, I do not.

Q. You don't know but what there may be as much impurities so far as the sanitary condition of the water now is concerned, as there was before the canal was opened or even more?

A. No, sir; I can simply testify to the facts on the mechanical side of it.

6071 Q. The river at the point from which the water was drawn prior to the opening of the canal, was very sluggish, was it not?

A. Yes, sir.

Q. And at times practically quiet, with very little current?

A. There was very little current in the river at that time.

Q. How is the current now?

A. It is much swifter and there is a more equitable stage of water.

Q. This bad condition of the water, then, was caused largely because of a lack of a current?

A. No, I couldn't say that; there might be a swift current with bad water, or a sluggish current with clear water.

Q. It is not very apt to remain clear if it is sluggish very long?

A. No, possibly not.

Q. There is no substance contained in the refuse from the straw-board company discharged into the Illinois river that is deleterious to the human system, is there?

A. Not at all, sir; the entire substance that straw-board is made from is straw and water and steam and lime; none of them are very deleterious to the human family or animals.

6072 Q. Have you at any time used the water from wells in your straw-board factory?

A. Oh, yes, very frequently.

Q. For washing felts?

A. Yes, sir; it is used, however, for washing up the pulp after it is cooked principally.

Q. Do you use it now for that purpose?

A. Yes, sir.

Q. And for washing the felts?

A. No, I think the river water is used exclusively for that purpose now.

Q. There isn't a very large quantity of refuse that goes from the Acme Harvesting Company into the river, is there?

A. No, none whatever; we use water only for drinking purposes and for steam manufacture and for flushing the closets.

Q. Do you know the particular place in this Kickapoo river where the city authorities dump the contents of the private vaults in the city?

A. I don't think they dump any in Kickapoo creek; it is too far away from the city.

Q. You don't know whether it is above or below the point where you take your water?

A. No, I am very sure that the city don't dump into the Kickapoo creek at any point.

WM. H. BINNIAN.

6073 S. P. BARTLETT, resumed the stand for cross-examination by Mr. Jeffries, and testified as follows:

Q. Mr. Bartlett, how often do you visit the various towns and cities along the Illinois river?

A. This season very seldom. In former seasons very frequently.

Q. How often did you visit them last season?

A. Well, I was over the river a good many times; I can't tell you just how many times; some of the places several days at a time and other places just touch in and out again.

Q. Do you remember how many times you visited Chillicothe last season?

A. No, sir, I don't recollect the number of times. I was there, oh, five or six times during the season or oftener; I guess oftener last season.

Q. How often would you remain when you went there?

A. Well, my last visit to Chillicothe was nearly two days. It would vary from half an hour to a day owing to the business I was going through there on.

Q. As a general proposition when you would go to these small towns you went there for a particular purpose and as soon as you could get through with your work you left?

6074 A. Well, not always; sometimes it wouldn't take me over fifteen or twenty minutes to transact my business and it would be two or three hours between trains. I didn't always go by boat by any means. When the boat landed there I would transact my business and then go on.

Q. And it was during these times, or occasional visits that you obtained the condition of the health of the people in these towns?

A. Oh, in going to a town of that kind, after I would get through my work as a rule I would hunt up the people I was acquainted with and talk to them, and would naturally drift in with all kinds of people in a general way. I don't know as I ever made it a special business to investigate the health records, except just in a general way.

Q. Captain, the cattle and stock that are fed during the dry season, or grazed during the dry season upon the low lands of the Illinois river bottoms, are around and along these lakes and sloughs as I understood you to say, and is that where they would get their water from?

A. Well, I will particularize a case; at and about Clear Lake and Spring Lake, there are a great many acres of land which grows very luxuriantly in grasses around these lakes and back from the bottoms, and these places are as a rule turned over to people who herd and graze their cattle. I intimately
6075 know those two places that I call to mind right now.

Q. How large in area are those two places which you speak of?

A. Well, there must be several thousand acres of grass in each.

Q. Where are the lakes in reference to this land?

A. Well, at Spring Lake between the lake and the main shore, there is a very large body of land that they call the Meadows, in which the grass grows very luxuriantly and very tall; that is one of the grazing places, and then at the upper end there is a great deal of land that is subject to overflow, but is a good deal of the time out; that is used very extensively. At Clear Lake that is almost entirely surrounded by good grazing land.

Q. Do you know whether or not there are any small streams entering into Clear Lake?

A. No, I don't know that there are any small streams running into it. There are several inlets to the river in high water, and there may be for all I know, some creeks running in from the bluffs. I have no knowledge of them.

Q. Do you know how deep or what the average depth of the water is in these two lakes, Clear and Spring Lake?

A. The water is deep in Spring Lake, in the lake itself. In Clear Lake I should think the greatest depth is perhaps 12 to 14 feet and then slowing off on the edges.

6076 Q. Now, what other bodies of grazing land on the Illinois river are you acquainted with except those surrounding Spring Lake and Clear Lake?

A. Well, nearly all the bottoms of the Illinois river are used for pasturing cattle and hogs. I can't specify, because I should have to go almost the entire length of the river to do so.

Q. In nearly all places where there is a wide stretch of lowland you find these lakes and sloughs, do you not?

A. Oh, yes, almost the entire length of the river.

Q. I understood you to say in your direct examination, that the Illinois river had no tendency to bar?

A. Well, I perhaps ought to qualify that. What I meant to say there are no sand bars. Now and then there is what are known as mud bars or shell bars, but unlike the Mississippi river it doesn't make a sand-bar everywhere there is a stream going in, except right here at Peoria, Farm creek.

Q. The water in the Illinois river flows with a very good current since the canal was opened, does it not?

A. The current has increased; I notice this year a very rapid current at several points upon the river, more than usual.

Q. This pollution that you speak of, Captain, before the canal was opened, was of a vegetable character?

6077 A. Well, I can't tell you; when I speak of it I speak of such personal experience as I have had with it. A very large amount of the damage above Peoria is due to the decomposition of vegetable matter. Below Peoria, that is the worst, the greatest amount of damage is done in my opinion, from the offal and refuse and whatever escapes from the sewers from these manufacturing institutions.

Q. Do you know the exact character of the matter that is discharged from the stills, glucose factories and other industries?

A. Yes, sir, I say exact character. I know this; that all the manure and slop and general offal from the cattle pens is run down to the river through long chutes to the river edge, that is mixed up with a manure of some kind, what constitutes it I don't know, and that is deposited on the river bank, the fluid escaping, it dries out and that lays there until it hardens, and then with any rise in the river it is either broken off by the raise in the river or by some artificial means and turned in and it floats down the river. That is the perceptible cause of a good deal of pollution. My own personal opinion is, however, that some of the most destructive elements come directly from the sewers of Peoria and from the gas houses.

Q. The land along the river below Peoria is of the same character as that above, is it not?

6078 A. Along Peoria Lake on the left hand side of the river going up, you meet with a good deal of gravelly beach, more of a rough bank. The ground is higher and less subject to overflow. On the other side of the river the distance to the bluffs is shorter and the land practically worthless from being constantly submerged. That is true in the upper Peoria Lake. Chillicothe is on the edge of upper Peoria Lake. After you get below Peoria, after you get down, say to Copperas creek dam, the river commences to widen out on both sides and it changes again after you get below. You have high banks and bluffs again.

Q. Then the same cause or opportunity for pollution from decayed vegetation exists below Peoria as well as above, does it not?

A. In extremely low water, yes, sir.

Q. The fishing industry along the Illinois river was very great before the canal was opened, was it not?

A. Yes, sir.

Q. And has been for a number of years?

A. Well, the output of coarse fish from the Illinois river ran down in 1880, to about 1,000,000 pounds a year, and has been constantly increasing ever since. That has been due, however, not to the character of the water altogether, but to the protection of propagation.

6079 Q. And the protection that the state has given the industry through its State Fish Commission?

A. And in the introduction of the carp.

Q. What do the carp feed upon, Captain?

A. The carp are by construction, natural vegetable feeders; unlike the majority of fish, they have no teeth and cannot bite anything. Their food is taken in by a sucking motion and they are as liable to take a piece of meat as they are a grain of corn. They are a purely vegetable feeder.

Q. The carp multiply very rapidly in the Illinois river, do they not?

A. Yes, sir; the carp are especially adapted to the waters of the Illinois river and they multiply very fast.

Q. And they constitute the principal fish that is placed upon the market from the Illinois river?

A. Yes, sir; they are the principal industry today of the Illinois river.

Q. There is as much vegetable growth along the banks of the Illinois river today as there was before the canal was opened?

A. No, sir; for the reason that the water has been constantly higher than it was before the canal was opened and consequently there isn't the same chance to grow.

Q. You know nothing of the condition of the water from a sanitary standpoint other than what you have testified?

6080 A. Well, I heard you say a while ago that you didn't care to go into expert testimony in that case. My investigations are all along that line and I don't care to go into it unless you want me to.

Q. Have you been going up and down the river every year since you were a commissioner?

A. Yes, sir; more or less every year; some years more than others.

S. P. BARTLETT.

Adjourned until 9 a. m., Friday, August 14th, 1903, at the National Hotel, Peoria, Illinois.

6081 National Hotel, Peoria, Illinois, 9:00 a. m., Friday, August 14, 1903.

Parties met pursuant to adjournment. Present, the Commissioner and same counsel representing the respective parties.

W. F. YORK,

called as a witness in behalf of the defendants, being first duly sworn by the Commissioner, was examined in chief by Judge Johns and testified as follows:

Q. State your name, residence and occupation?

A. W. F. York; Peoria, Illinois; I am a river man—captain.

Q. Are you a licensed captain and pilot on the Illinois river?

A. Yes sir.

Q. How long have you been engaged in steamboating upon the Illinois river?

A. Well, since 1850, I have been afloat on the river.

Q. Have you traveled the entire length of the river at various times?

A. Yes sir.

Q. Are you now engaged in running steamboats upon the Illinois river?

6082 A. Yes sir.

Q. What was the condition of the Illinois river before January, 1900, when the drainage canal was opened?

A. In what way, the stage of the water?

Q. Yes, and its condition and the growth in it?

A. Well, it was pretty sluggish and dirty; there was no current in it; and a green scum on it.

Q. Before the opening of the drainage canal what was its condition above Peoria?

A. Why there was no current to amount to anything before the drainage canal was put in; there was a low stage; it was covered with a green scum; dead, sluggish.

Q. Did it smell badly at times before the opening of the drainage canal and above Peoria?

A. Oh yes, bad condition, it didn't stir at all, it just lay around rotten, and full of all kinds of insects.

Q. Was there enough growth in it at that time above Peoria to hinder the traveling of the boat, would it clog up the wheels?

A. Oh no, nothing of that kind, no sir.

Q. How was the water above Peoria before the opening of the drainage canal for steaming purposes?

A. Well it was not as good as it is now.

6083 Q. What seemed to be the matter with it?

A. Well it was very dirty, we had to clean the boilers every week; we got a good deal of dirt out of the boilers.

Q. Since the opening of the drainage canal, and above Peoria, what has been the condition of the water?

A. Well, I think it has been better than it was before the drainage canal was put in; better for steaming purposes; we get lake water instead of river water and slough water; I think that is the cause of it; we get lake water, purer water.

Q. Below Peoria, what was the condition of the river down as far as Copperas Creek dam, before the opening of the drainage canal?

A. Well, it was just about a sewer; it was full of offal and manure and hay and everything that comes out of the cattle and hog pens; very dirty, and very bad smell, it would stink; there was islands of this stuff in the river.

Q. How was it for steaming purposes below Peoria before the opening of the canal?

A. Very bad; the boiler would foam; take it below the still houses the river just stood full of this stuff, all the time; and you would pump it up in your boilers and it would foam all over everything, and it would stop up your boat a few moments to check up your boilers to see where your water was; when the boiler would foam it would slobber up through your safety valve.

6084 Q. Now since the opening of the drainage canal and below Peoria down as far as Copperas Creek, what has been the condition of the water?

A. Why, it has been considerable better than it used to be; it has been purer and there hasn't been so much dirt in it; and we have never had any trouble since the drainage was put in; we have about three feet more water and about a mile more current. Before that we had about three-quarters of a mile an hour current and now we have got about a mile and three-quarters below Peoria.

Q. How is it for steaming purposes between here and Copperas Creek since the opening of the canal?

A. Oh, it is just as good as it was before any more than before we had to stop and now we don't have to stop, I don't know as it takes any more coal to make steam, and the water used to foam before and it don't foam now; it don't raise an eruption in the boilers.

Q. Before the opening of the drainage canal, what was the condition of the water between Copperas Creek and La Grange dam?

A. Why it was pretty dirty.

Q. Was it better or worse than above Copperas Creek?

A. It was better, for the simple reason that it went farther; it couldn't be any other way; the farther it goes the better it gets.

6085 Q. Since the opening of the drainage canal how has the water been between Copperas Creek and La Grange?

A. Well it has been better than it used to be.

Q. How is it for steaming purposes?

A. Why it is better for that; there isn't so much dirt in it.

Q. Before the opening of the drainage canal, what was the condition of the water between La Grange and Kampsville dam?

A. I think it is better today than it was. The farther down you go I think the better it is.

Q. Before the opening of the drainage canal was there any trouble with it for steaming purposes between La Grange and Kampsville?

A. Why, we never had to stop there; we got into the water where it settled and cleared. About the only place where we had to stop was between Pekin and Copperas Creek. After you passed over the dam there you know, that would purify it and shake it out and deposit it in spots, so that we didn't have to stop. We never foamed below Copperas Creek. You might a little after you left there, but after you blowed her off once or twice after you left Copperas Creek, she would be all right from there to St. Louis without you got a raise out of the Missouri, and got a chunk of mud out of there. And
6086 if you did, you would get some more trouble; that is always the case. If you get a seven or eight foot raise out of the Missouri, you would have some more foam after you went below Madison.

Q. When there is a raise in the Missouri or Mississippi river, the water from those rivers backs up the Illinois?

A. Yes it does, for a short distance, thirty or forty miles sometimes; owing to the condition of this river.

Q. And in that case the water in the Illinois would be of the character of the water of the river which is on the rise would it?

A. Why it would be similar to that, yes, where it was backed up, of course. Not so much so as the river itself, but it would be similar to it.

CROSS-EXAMINATION, by Mr. Jeffries.

Q. Are you an engineer?

A. No sir. Not a licensed engineer.

Q. You are a captain of a boat are you?

A. Yes sir, captain and pilot.

Q. What is the cause of foaming in your boiler?

A. Oh, it is dirt in the water, mud or grease, vegetation, rotten vegetation.

6087 Q. Did you ever steamboat any on the Missouri river?

A. Yes sir.

Q. Isn't it a fact that the foaming of the boilers is due to the unkept condition of the boilers?

A. Not necessarily; you can take a new boiler and put it into the Chicago river in the condition is was in before the drainage was put in—you can take a new one out of the shop and run it up through the packing houses and bring it back down and if you carry much water it will foam.

Q. Did that condition of the water with reference to the foaming in the boilers obtain throughout the entire year on the Illinois river?

A. Why not in the spring of the year when it was high, when there was a current.

Q. What is this green scum that you spoke of in your direct examination composed of?

A. Why I don't know exactly, it is stuff that floats out of the sloughs and along the shores, vegetation, that is my idea about it; I don't know that I am right or not.

Q. Well the sloughs are there yet are they not?

A. Why yes, I have noticed them always as I passed along, at the same place.

6088 Q. The same conditions obtain in the sloughs as formerly?

A. Well, I should think it would; I should think it would be the same as it always was; they have the appearance of being the same.

Q. Now as a matter of fact this green scum did not float upon the surface of the water except where it was stagnant, or where there was no current, or only at such times of the year when the water was low and there was no current?

A. Yes, that is about the time you would find it, when the water was low and there was no current to carry it off.

Q. When you say the water is better now than it was before the canal was opened, you have reference simply to observation from the condition of the water and the volume of water the very much stronger current, and the fact that the green scum that floats out of the sloughs into the current has disappeared down the river?

A. Well it passes off instead of staying there, and then there are other reasons. Before the drainage was put in, take it when the river was low and it would get covered with this scum and dirt on top it would get very thick and sluggish, you would find dead fish all along the shore; they would die from some cause or other; whether it was the water or not I don't know, but you would find them all along the shore at different places, and that isn't the case now. You hardly ever see a
6089 dead fish along the shore now. And the fish are in a livelier condition.

Q. It stands to reason then, doesn't it, that the conditions being similar, aside from the greater volume of water will send impurities from the sloughs and other places along the river—they are there yet as they were before, does it not?

A. Why I would think there would be about the same amount; there is about the same area of sloughs you know, and there is about as much vegetation. Under the same conditions it would be about the same I should think, any more than it passes off now and before it didn't; that is my idea about it.

Q. And that is your reason for saying that the water is better?

A. Why yes.

Q. How long have you been on the Illinois river?

A. I have been here since 1850, here and on the Chicago river, but mostly on this river.

WM. F. YORK.

6090 **ISAAC TAYLOR,**

called as a witness in behalf of the defendants, being first duly sworn by the Commissioner, was examined in chief by Mr. Todd, and testified as follows:

Q. State your name, residence and occupation?

A. Isaac Taylor; residence Peoria, Illinois; real estate and loan business.

Q. How long have you been in that business?

A. About 33 years.

Q. Have you held any position in the State government?

A. Canal Commissioner and also on the special commission to inspect the Chicago drainage channel.

Q. What is the position of Canal Commissioner?

A. The Board of Canal Commissioners have charge of the Illinois and Michigan Canal and also of the locks and dams at Henry and Copperas Creek.

Q. When were you canal commissioner?

A. From 1885 to 1889.

Q. In the performance of your duty as canal commissioner, were you on the Illinois river?

A. Frequently.

Q. Between what points?

A. Between La Salle and Copperas Creek.

6091 Q. Are you familiar with the Illinois river?

A. Yes sir, somewhat.

Q. Covering what period are you familiar with the river?

A. In a certain sense from 1850 until the present time.

Q. Have you ever had any connection with any association which had for its object the improvement of the Illinois river?

A. Yes sir, the Illinois Valley Association; I am chairman of that association and have been most of the time, since 1887.

Q. What is the object of the Illinois Valley Association?

A. It is to try to secure the improvement of the Illinois and DesPlaines rivers.

Q. For deep navigation?

A. Yes sir.

Q. During the last ten years have you been on the Illinois river?

A. Yes sir.

Q. How frequently?

A. Oh, half a dozen times probably or more; by boat I have inspected the river more than that, but by steamer about half a dozen times, may be a dozen.

Q. Were you one of the Committee appointed by Governor Tanner instructed to inspect the drainage canal and report to him as provided by the law under which the drainage 6092 canal was constructed?

MR. JEFFRIES: Objected to as leading.

A. Yes sir.

Q. When were you appointed and how long did you serve?

A. I was appointed I think in May, 1899, and held that position until June, 1900.

Q. What were the duties of that position?

A. They were to inspect the drainage channel for the employment of competent engineers and also of the Chicago river from the lake to—the connection of the canal with the river, and ascertain if the Sanitary District of Chicago had complied with the law in the construction of the canal.

Q. As such commissioner what did you do?

A. We employed an engineer in chief and made complete surveys of the entire channel and of the Chicago river and made a full investigation of all the requirements of the law.

Q. What did you find?

A. We found that the law had been complied with.

MR. JEFFRIES: We object to the question as incompetent, irrelevant and immaterial and leading, and it is not a proper examination of the witness to require him to pass judgment as to whether or not the law has been complied with. It is a question of fact for the Court to determine upon the testimony of the witness, after the witness has detailed what 6093 has been done. I move to strike the question and answer out for the reasons stated in the objection.

Q. As a member of the Valley Association have you made any inspection of the Illinois river?

A. Yes sir.

Q. When and for what purpose?

MR. JEFFRIES: We object to the witness testifying in regard to the inspection he made of the Illinois river as a member of the Illinois River Valley Association for the reason that the corporation as such has not been shown to have had authority to make such examination, and whatever the witness might say upon the subject must be limited to his own personal observation as a private citizen and without reference to any position which he might hold in this so-called association.

MR. TODD: In reply to the objection, counsel for defendant Sanitary District desires to state that the witness is only called to express his observations as a private citizen, but as a private citizen to give his knowledge of the Illinois river in the discharge of his duties both which he owed to the State, as well as the duty which he voluntarily assumed to perform in behalf of the Valley Association.

A. I made an inspection during the summer and fall of 1900, and the summer and fall of 1901, and more particularly—
and I have made frequent inspections of the river since
6094 that time, but not so frequently.

Q. For what purpose?

A. Well, for the purpose of ascertaining the character of the water as compared with the water before the Chicago drainage channel was opened and also to make some estimate of the amount of the flow. I will add to that, the effect of the flow upon the Illinois river.

Q. Before the opening of the drainage canal, what was the character and quality of the water in the Illinois river?

A. When the water was low, it was bad looking and bad smelling water, especially in the upper portion of the river.

Q. From what point to what point?

A. Well, from Lasalle—it was more noticeable from Lasalle to Henry and it was also noticeable from Henry to Peoria, but not so much so.

Q. How was it from Peoria down?

A. It was in bad condition.

Q. Can you describe it more fully?

A. When the water was low, from Peoria down to Copperas Creek, it was usually observed that the waters were of a dark character with considerable sediment in it.

Q. How far down did that condition obtain?

A. To a certain extent all the way down to Copperas Creek.

6095 Q. Since the opening of the drainage canal, what has been the effect of the turning of the waters of Lake Michigan, into the Illinois river, upon the Illinois river and the waters of the Illinois river?

A. It has made the water very much clearer and very much better.

Q. What is the condition of the water immediately above Peoria, in Lake Peoria?

A. At the present time?

Q. At the present time?

A. Very good condition.

Q. How about the odor of the water?

A. There is no odor discernible.

Q. How is the condition below Peoria?

A. I couldn't testify so definitely in regard to that, only that the water has a darker appearance below Peoria than it is above; it is not in as good condition below as it is above.

Q. As compared with the condition of the water before the opening of the canal, how does the condition below Peoria today compare with what it was then?

A. It is much better.

Q. How about the character of the river itself?

6096 A. The river has a larger flow of water; I estimate it is from two and a half to three feet deeper, the water is clearer and the water better in every way for navigation and sanitary purposes.

CROSS-EXAMINATION, by Mr. Jeffries.

Q. What did you say was the condition of the water of the Illinois river below Peoria since the canal was opened?

A. I said that it was better than it was before, but not as good as it was above Peoria.

Q. Are you acquainted with the water in the canal as it runs over Bear Trap dam?

A. Not at the present time. I have seen it several times, but not within a couple of years.

Q. What was its condition as compared with the condition of the water of the Illinois river immediately below Peoria?

A. It was in a much worse condition.

Q. Do you know whether or not the water makes a continuous flow from Bear Trap dam to Peoria?

A. I couldn't say positively. I could only judge by the depth of the Illinois river at low water.

Q. What did you find in this respect in the examination and your study of the water in the river since and prior
6097 to the opening of the Chicago drainage canal?

A. I found that the river where I had made the inspection principally above Peoria, was clearer and better and more of it, a greater depth than before the opening of the canal.

Q. Then you did not examine the condition of the river from Peoria through its entire existence from Bear Trap dam to the city of Chicago?

A. Only by casual observation in traveling over the water, which was quite frequently, both before and after the opening of the channel.

Q. Are you an expert on the sanitary condition of water?

A. No sir.

Q. When you say that the water is better you mean from observation?

A. From observation; from looking at the water.

Q. You say one of the objects of this Valley Association was to see that the law with reference to the organization of the Sanitary District of Chicago, and the construction of the drainage canal by it was complied with? Or was it done by the special commission referred to by you in your direct examination?

A. It was done by the special commission appointed by the Governor.

Q. Did you make a report?

6098 A. Yes sir.

Q. In writing?

A. Yes sir, made a report in June, 1900.

Q. Where did you file that report?

A. Filed it with the Governor and Secretary of State. The Secretary of State's was the official copy; we filed one copy with the Governor and one with the Secretary of State.

MR. JEFFRIES: I move to strike out all that the witness has said with reference to the findings of his commission, for the reason that the original on file in the Secretary of State's office is the best evidence.

Q. Do you know the number of gallons per minute of water that has been coming over the Bear Trap dam since the opening of the canal?

A. They measure the water by cubic feet. I couldn't state positively only from reports and conversations with the Board of Trustees of the Sanitary District, excepting at the time that the water was turned in. I knew then what the flow was.

Q. What practical steps did this commission take to ascertain the volume of flow through the canal and the river over Bear Trap dam?

A. We employed a prominent engineer, Mr. Fitzgerald of Boston to make surveys and investigations of the channel with the view of ascertaining the velocity of the current in the 6099 channel after the water was turned in and the capacity that it would have for carrying water with a current not to exceed three miles an hour. That investigation was made thoroughly and in that investigation our commission depended largely upon our expert engineer in making the proper estimate to ascertain the facts.

Q. Do you know personally that he performed this work or that he obtained this data from the officials and employes of the Sanitary District?

A. We employed different engineers—sub-engineers to make actual surveys of the whole work, including the Chicago river, without any reference to the trustees of the Sanitary District.

Q. How long in period of time was it that he was performing this work?

A. About six months we had him in our employ I think.

Q. With reference to dates, what particular time was he thus employed?

A. He was employed from—I can't state definitely when he commenced, but I think in July, 1899—and closed his work I think sometime in December, the last of December or the first of January. I will not be definite about the exact time, but that was approximately the time.

Q. This work then was done before the canal was opened?

A. Yes sir.

6100 Q. And your principal object was to observe the construction and capacity of the canal?

A. Yes sir.

Q. But upon the question as to whether or not the drainage district has been turning the required amount of water through the canal and over the Bear Trap dam since the opening, you know nothing?

A. Practically nothing, excepting that I can ascertain from the river here.

Q. Don't you know that the War Department at Washington restricted them from passing the full amount of water required by the statute under which the district was organized, through the canal?

A. I was so informed.

Q. And that since that order was made, the Sanitary District of Chicago has not been complying with the statute authorizing its creation and the construction of the canal?

A. I can't state that, but then I don't know the exact flow that they are making.

Q. The water here in the river is not used by the people of Peoria for drinking and domestic purposes?

A. No sir, not as a rule.

6101 Q. Is it not a fact that the Board of Health or the Health Commissioner of Peoria is on constant watch to prevent the use of the Illinois river for domestic purposes?

MR. TODD: I object for the reason that the witness is not qualified to testify upon what the Health Commissioner is doing.

A. No sir, I couldn't state. Not to my knowledge.

Q. Is it not a matter of public concern by the officials of the city and in public documents to the people that the water of the Illinois river should not be used for drinking purposes?

A. Not to my knowledge. I have never heard anything of that kind.

Q. What is your opinion with reference to the extent of the pollution of the river at Bear Trap dam by the sewage from Chicago, as compared with the pollution of the river by the sewage of Peoria?

A. In my opinion it is greater.

Q. And it is greater in proportion to the population?

A. I couldn't state as to that.

Q. I don't know on what you base your opinion then?

A. Upon the character of the water, upon the looks of the water.

ISAAC TAYLOR.

6102 E. M. WYATT,

called as a witness in behalf of the defendants, being first duly sworn by the Commissioner, was examined in chief by Judge Johns and testified as follows:

Q. State your name, residence and occupation?

A. E. M. Wyatt, 403 Wisconsin Avenue, Peoria. I am on the Health Department at present.

Q. Were you at any time an inspector at the Stock Yards in Peoria?

A. Yes sir.

Q. During what time?

A. From 1897 to 1901.

Q. Where are the stock yards at Peoria?

A. They are in the south part of town here on South Street, on the river.

Q. What is the area of the stock yards proper?

A. Well, I suppose—well, I couldn't say exactly.

Q. Your best judgment?

A. Well as to the number of cattle and hogs that they handle there—

Q. I am asking about the extent of them in acres?

A. I would judge they were about a block and a half each way, perhaps two acres and a half in the yard; not to exceed that I don't think. 6103

Q. Are there any slaughtering establishments near them?

A. A couple of packing houses, slaughter houses—well there are three, two packing houses and one slaughter house.

Q. What were your duties as inspector of stock?

A. To look after the diseased animals that were shipped in.

Q. When you found a diseased animal, what became of it?

A. We generally had it for a post-mortem examination; we took it down to this public slaughter house and had it slaugtered there; called their assistant state veterinary and he examined it to see whether it was fit for food or not.

Q. Do you know of a disease called anthrax among cattle?

A. I never knew any of it here; I have heard of it but I didn't know it.

Q. With what diseases were the cattle which were brought here affected?

A. Well there is what they called the lump-jaw; cancer eyes and lung trouble.

Q. How many cattle annually passed through the yards in Peoria during the four years that you were inspector?

A. Well, I couldn't tell you; I would judge it would average somewhere from five to seven hundred a month, that was brought in here for home consumption.

Q. Was this yard also used as a feeding point in transit?

6104 A. Well sometimes through cattle would come through here and be taken off to feed, very seldom though. Cattle shipped in from Missouri and sometimes Iowa, would stop off here and feed.

Q. How many hogs passed through these stockyards in these four years, each year?

A. Well I suppose there was anywhere from 15,000 to 25,000 a month.

Q. How many sheep?

A. Very few sheep,—very few.

Q. Was there any disease among the hogs that you inspected here, and if so, what was it?

A. Well I never inspected the hogs; I was just on cattle.

Q. Do you know in a general way, whether there was hog cholera among the hogs shipped in here?

A. Oh, there were some cases of hog cholera.

Q. What would become of the animals infected with that disease?

A. They generally killed them and sold them for people to eat; the scalpers would buy them you know. The packing houses never bought them and packed them.

Q. How were the animals fed here?

A. They were fed on corn, the hogs were in a pen, on board floors. The cattle was fed in mangers, hay-racks, hay mangers. 6105

Q. Was there any drainage in the pens in the stockyards?

A. Some, yes sir.

Q. What was it?

A. Why to drain the water off; there was catch basins to take the water out of the yard, out of the pens.

Q. Into what did the drainage flow finally?

A. I think it went into the river. The cobs and the dirt on the floors was hauled out and thrown on the river bank.

Q. Would it then be carried off by water in the river?

A. Well it would have to get pretty high to carry it off; they filled up holes with it on the river; I suppose some of it went down the river though.

Q. What kind of slaughtering is done here in these slaughter-houses adjoining the yards, hogs or cattle?

A. Hogs and cattle both.

Q. How many hogs were slaughtered here in your judgment?

A. Well, Goden and Sons I think, kill anywhere from three to five hundred a day sometimes; they would average anyway I guess 250 a day the year around.

Q. And the other firm?

A. Well, about the same. That public slaughter house down below there, the reason it is called the public slaughter house is because the farmers bring their stock in and have it killed there.

6106 Q. How many cattle are annually slaughtered here by the two slaughtering firms?

A. Well it is pretty hard to make an estimate of that because they don't kill very many cattle; perhaps they will kill 300 a week, the two firms.

Q. Is this institution you call the public slaughtering house owned by the city or is it a private enterprise?

A. Private.

Q. Where are these slaughtering houses and the public slaughter house situated with reference to the Illinois river?

A. The public slaughter house is situated I guess about a couple or three hundred feet west of the river; the two packing houses about a block and a half from the river.

Q. Into what place is the sewage from these three institutions emptied?

A. Into the river I think.

Q. Have you now some position with the city of Peoria as an officer?

A. I am on the Health Department.

Q. As a sanitary officer what are your duties?

A. To look after anything, to see there is no garbage, no nuisance laying around the street, to look after the vaults and
to see that the lots are cleaned up of weeds and rubbish
6107 and nothing strewn on the streets or alleys.

Q. What is done here with the contents of privy vaults?

A. Some of the vaults are connected with the sewerage system; some are hauled and dumped; I don't know where they do dump them—those that are not connected with the sewers. I think there is a place provided by the city though, where all this dumping is done; I think so.

CROSS-EXAMINATION,

By Mr. Jeffries.

Q. How many stock yards companies are there in Peoria?

A. Only one.

Q. And that covers about two acres and a half?

A. I should judge about two acres and a half.

Q. How far is it situated from the river?

A. About a block and a half.

Q. What is the character of this public slaughter house that you spoke of?

A. Well, they kill stock there for anybody that brings it around; a great many of the farmers hogs that they kill for winter use, they bring them there and have them slaughtered,

and most of those scalpers in the yard there take theirs down there and kill them and some of the butchers that does their own butchering goes there and has them killed too; that is the
6108 reason it is called the public slaughter house.

Q. There are no diseased cattle killed there that you know of?

A. No, nothing only what are caught by the inspector and taken there to be killed; then they are post-mortemed by the assistant state veterinarian.

Q. There are no diseased cattle turned into the yards are there?

A. No, no fever or anything of that kind that I ever know of.

Q. And none goes out?

A. And none goes out; no if they would come here they would be quarantined and sent out; that would be the fever cattle; those with sore eyes, they would be condemned and killed if they weren't fit for food.

Q. Now what about these cattle that have sore eyes and lungs?

A. They are generally condemned; they are pressed and sold for fertilizers. They are steamed and then pressed.

Q. In other words cooked?

A. Oh yes sir, thoroughly cooked, dried and ground up and then go to the fertilizer.

Q. Could you approximate the number of cattle, hogs and sheep that go through the stock yards each year?

A. No, nothing more than I told there in answering that
6109 to the best of my ability.

Q. How much of your time is occupied in working as a health officer for the health department of the city?

A. Every day.

Q. Do you investigate and keep careful watch upon the manner and living and natural habits of the people living along the banks of the river?

A. That is not my territory at all.

Q. You have nothing to do with the territory along the river?

A. No sir.

Q. You do know though that every precaution is taken for the good of the health of the people living along the river?

A. It appears to be. I know there is up in my part of the town. There are eight wards here and there are eight sanitary inspectors, and my ward happens to be west. I have nothing to do with the river but I think that the people are doing everything they can for the benefit of the health of the people.

Q. They don't use the water from the river?

A. No sir, quite a good many have got wells and they all use city water.

6110 Q. How long have you been on the Board of Health?

A. Going on three months.

E. M. WYATT.

6111 R. D. CLARKE,

called as a witness in behalf of the defendants, being first duly sworn by the Commissioner, was examined in chief by Mr. Todd and testified as follows:

Q. What is your name?

A. R. D. Clarke.

Q. What is your business?

A. In the distilling business.

Q. What distillery are you connected with?

A. Clarke Brothers & Company.

Q. What position do you hold in the distillery?

A. General Manager.

Q. Are you an officer of the Company?

A. Yes sir.

Q. What office do you hold?

A. General Manager of the concern and a director of the company.

Q. How long have you been in the distilling business?

A. Since 1892.

Q. Connected with the same distillery you are connected with now?

A. No sir.

6112 Q. What other distillery were you connected with prior to this one?

A. Clarke Brothers.

Q. What became of that distillery?

A. We organized under Clarke Brothers and Company and built a new distillery.

Q. Are you connected with any other institution except the distillery?

A. Yes sir.

Q. What other?

A. President of the Thomas & Clarke Cracker Manufactory.

Q. Any other institution in Peoria?

A. President of the Peoria Board of Trade.

Q. How long have you been president of the Peoria Board of Trade?

A. During this fiscal year.

Q. Are you acquainted with the practical operation of a distillery?

A. Yes sir.

Q. In your experience as a distiller, have you fed any cattle?

A. Yes sir.

Q. Will you describe the method of feeding cattle in the 6113 distilleries at Peoria?

A. Formerly all distillers attempted to feed one head of cattle for every bushel of grain mashed. At the present time there are feed houses taking the place of the cattle feeding industry, and there are not one-fifth the cattle fed here that there were formerly. The method used today is to give one steer about 275 gallons of slop and eight pounds of hay per day. This slop contains about twelve to thirteen pounds of solids, the rest of it is liquid, or gluten in solution.

Q. What is the purpose of giving the hay?

A. To hold the slop in them.

Q. Do you know the average number of cattle fed in Peoria during the last ten years?

A. For the last five years they would average about 10,000, perhaps a little more.

Q. Are these cattle salted?

A. Yes sir.

Q. In the fattening of 10,000 head of cattle, what is the amount of salt used?

A. About five carloads a year.

Q. How much salt is contained in a car load?

A. About 140 barrels.

6114 Q. How many pounds of salt in a barrel as used in this business?

A. Between two and three hundred.

Q. How is this salt fed to the cattle?

A. It is thrown along in front of the lead troughs, so they can lick it up if they want it.

Q. Do you know about how much excreta is discharged from a steer in 24 hours?

A. I don't believe I could answer that; it is a matter of record I think the Agricultural department in Washington know. I have seen it but I hate to say.

Q. What becomes of the excreta from the cattle?

A. Most of mine runs over the bottom-land back of the distillery.

Q. How long has that disposition been made of it?

A. Two years.

Q. How many cattle do you feed in your distillery?

A. 600 head of bulls at one time.

Q. Do you know of any other distillery which makes the same disposition of the offal of the cattle as you have of yours during the last two years?

A. No sir.

Q. Prior to that time what became of the offal?

A. We didn't feed at the new house at all.

6115 Q. In the old distillery what became of it?

MR. JEFFRIES: I object to the question for the reason that the old distillery was operated prior to the opening of the canal and was not in operation at the time the canal was opened in 1900, and it is therefore immaterial.

A. It run in the river.

Q. What becomes of the excreta of the cattle fed in other distilleries in Peoria?

A. It runs in the river.

Q. In the mashing of grain for distillation purposes, do you use the water of the Illinois river?

A. I have no connection with the river whatever.

Q. Do you know whether it is used in other distilleries?

A. Not positively at present.

Q. Since the opening of the canal do you know of any distilleries which use the water of the Illinois river for mechanical and condensation purposes?

A. They all use it for boilers except myself.

Q. Have you used it for boiler purposes since the opening of the drainage canal?

A. At one of my steam plants I have.

Q. Which plant is that?

A. The rectifying house.

6116 Q. What is a rectifying house?

A. Place where we rectify whiskey.

Q. How long have you used the Illinois river water in that business, for steam making purposes?

A. Four years.

Q. Are you acquainted with its operation in this institution?

A. Yes sir.

Q. How does the water of the Illinois river compare today with what it did before the opening of the drainage canal, in the manufacture of steam and for mechanical uses of the water?

A. It is better for boiler purposes.

Q. In what way?

A. The boilers don't seem to have the tendency to foam that they used to have when pushed pretty hard.

Q. Have you investigated the foaming in the boilers?

A. Yes sir.

Q. What is it that caused the boilers to foam before the opening of the drainage canal in using the waters of the Illinois river?

A. In my opinion, I think it must have been the organic matter.

Q. Will you explain that condition at length?

6117 A. On investigating this subject I find that there are three principal things that make boilers foam; one is sodium carbonate, one is organic matter and one is an alkali. I don't think we have enough sodium carbonates or alkalies in the water to make it foam, and therefore I judge it must be the organic matter. Our principal scale forming substances are carbonate of lime and magnesia, and sulphate of lime and magnesia.

Q. How did this foaming in the boiler affect the machinery?

A. Liable to knock a cylinder head out.

Q. Were any precautions taken prior to the opening of the canal to guard the safety of the boilers and the cylinder heads?

A. We took our chances on it, but at times we would put it through a heater and take out all we could in that way, the sediments. And we used different boiler compounds, but I don't think a boiler compound is good for foaming.

Q. What was the effect of this foaming upon the generation of steam?

A. I judge that the small particles would settle in a slush or mud in the bottom of the boiler and if your steam got at all low, they would prime and flow over into the engine, especially with a neglect of being blown off regularly.

6118 Q. Since the opening of the drainage canal, what changes, if any have you observed in the effect of the water of the Illinois river upon the boilers and machinery?

A. The scale appears to have a little different color to it.

Q. How about the foaming?

A. I don't hear of any complaint of it.

Q. Have you observed yourself, the operation of machinery using the water from the Illinois river?

A. Yes sir.

Q. Where and under what conditions?

A. In our old rye house; also at the rectifying house and at other distilleries.

Q. Have you formed a conclusion as to the condition of the water today for steam making purposes as compared with the water before the opening of the drainage canal—in the Illinoios river?

A. I have.

Q. What is that opinion?

A. It has very much improved.

Q. Are you acquainted with the Illinois river?

A. I am between the dams.

Q. What dams?

A. Copperas Creek and Henry.

6119 Q. How long have you been acquainted with that stretch of the river?

A. Fifteen or twenty years—fifteen years I guess.

Q. Do you own any land along the Illinois river?

A. Yes sir.

Q. How much?

A. Half owner of about 1000 acres.

Q. How did you become acquainted with tnat stretch of the Illinois river?

A. Hunting and fishing and on my yacht.

Q. How large is your yacht?

A. 52½ feet over all and ten foot beam.

Q. Operated by steam?

A. Gasoline.

Q. How often are you on the river?

A. Average once a week in the summer time and fall.

Q. Did that average prevail prior to the opening of the drainage canal?

A. Not so much, but I was on the river very frequently.

Q. What was the condition of the water in the Illinois river prior to the opening of the drainage canal from Peoria to Henry?

A. Summer or winter?

6120 Q. Both; all the seasons that you can speak of.

A. During high water it was good, but a trifle muddy; during the low water stage there appeared a sort of a green scum that would form and bubble after the boat, which I have not noticed of late.

Q. Was there any odor to the water?

A. Yes, considerable at times.

Q. What was the character of the odor from Peoria to Henry?

A. When the ice broke up, it was very foul.

Q. Did you observe any effects of the water under those conditions, upon fish in the river?

A. I have seen thousands of dead ones along the river, but do not remember seeing them above upper Peoria bridge.

Q. What was the condition of the water between Peoria Bridge and Pekin?

A. I don't think the current was as strong there as between Peoria and the Upper Bridge at Peoria.

Q. How did the stretch of river from Peoria bridge to a distance half-way between Peoria and Pekin compare with the same distance above Peoria prior to the opening of the drainage canal?

A. The river was considerably more dirty.

6121 Q. Any other differences?

A. It smelled a little different.

Q. What was the cause of that condition?

A. There could be several reasons for it.

Q. What are they?

A. Offal from the cattle and sewage from the city. Those are the principal ones I guess.

Q. As you left Peoria towards Pekin, how far down the river did the conditions at Peoria remain the same?

A. About to Kickapoo Creek.

Q. After leaving the creek, what changes, if any, did you notice in the Illinois river?

A. I noticed the color of the water; it seemed to be more of a muddy color caused by the washings from the hills, coming in from the creek.

Q. How did the condition at the Copperas Creek dam compare with the conditions at Peoria before the opening of the canal?

A. I always considered the river at Copperas Creek dam in the same condition that the river was above Peoria.

Q. Where was it that you observed these great quantities of dead fish?

A. I have seen them all the way along the river from a few miles above here, down. I never paid much attention to it
6122 above the upper bridge.

Q. Since the opening of the drainage canal, how does the water between here and Henry compare today with the water that was there prior to the opening of the drainage canal, at similar stages?

A. We have never seen the low stage of water since the canal was opened that we saw previously, therefore I cannot judge as to that.

Q. How does it compare in average condition today with what it was before the opening of the canal?

A. It seems to be very much improved.

Q. In what resepct do you note the improvement.

A. The color of the water and about an eight or nine foot stage.

Q. How about the odor?

A. That surely is better at that stage.

Q. Have you observed lately the condition of the Illinois river opposite the distilleries and glucose factory in front of Peoria?

A. Yes sir.

Q. What is the condition of the water along that two or three mile stretch of river?

A. It is much dirtier than it is above town.

Q. Does that condition immediately in front of Peoria 6123 obtain all the way down the river to Copperas Creek?

A. I am of the opinion that it disappears before it reaches Kickapoo Creek, less than two miles.

Q. And how does the water become as you go down the river towards Copperas Creek dam?

A. To Pekin it gets better; below Pekin for a mile or two it is bad again and by the time you reach Copperas Creek or even Spring Lake, the water is in good condition.

Q. How does the general condition of the water in the Illinois river from Copperas Creek to Henry, taking in the conditons that exist at Peoria and Pekin compare today with the conditions that existed prior to the opening of the drainage canal?

A. It appears to me it is very much better.

Q. Do you know of anyone who drinks the water of the Illinois river today?

A. I have drank it myself.

Q. How frequently?

A. Only when I couldn't get anything else to drink.

Q. Where did you drink the water; at what points on the rvier?

A. At Rome Flats.

Q. Did you ever experience any ill effects from the drinking of the water?

6124 A. None whatever.

Q. Have you known of others who have drunk the water?

A. I know a doctor that drank it; at Duck Island.

Q. Do you know of anyone who has gotten typhoid fever from drinking the water of the river since the opening of the canal?

A. No sir.

Q. What is your opinion as to the general sanitary condition of the waters of the Illinois river at present as compared with before the opening of the canal?

A. I took it for granted it is better than it used to be from the absence of smell and the color.

Q. Are there as many mosquitoes on the river now as there was before the opening of the canal?

A. There don't seem to be as many this year or last year as formerly, during a low stage of water.

Q. Do you notice any difference in the fish in the river today over the fish of before the opening of the canal?

A. I have eaten them both times; I don't know as I see much difference.

Q. Could the water today, of the Illinois river, be used for manufacturing purposes?

MR. JEFFRIES: Object to the question because the character or kind of manufacturing purposes is not stated in the question.

A. What kind of manufacturing purposes?

6125 Q. In the distilling business?

A. It could be used in the mashing process.

Q. Do you know of any distilleries that use it for that purpose?

A. Not positively, at present.

Q. You are a practical distiller, are you not?

A. Yes sir.

Q. Could the water be used to advantage in the mashing process at the distillery?

A. I would just as soon have it as any other.

CROSS-EXAMINATION,

By Mr. Jeffries.

Q. In what way is it used in the mashing process?

A. During that process it is boiled at 310 degrees.

Q. The corn with the water?

A. Yes sir.

Q. Now, how is the water afterwards separated from the corn or the product of the corn?

A. It is converted into sugar first; then to spirits—or then to alcohol, and a whiskey vapor is made at a much lower temperature than steam, hence the vapors are removed in that way and the water vapors are not saved at all to speak of. What water is in it is afterwards taken out.

6126 Q. So that the water in the condition in which it is drawn from the river does not and would not enter into any articles that you manufacture?

A. No sir.

Q. The whiskey is obtained by a process of evaporation?

A. Yes sir.

Q. And the water is poured into the vats, I suppose they are, containing corn?

A. Yes sir.

Q. And boiled to what temperature?

A. 310 degrees.

Q. Mr. Clarke, what did you say became of the offal from the cattle that you feed in your pens?

A. It is run onto the low-lands back of the distillery; we make ground in that way.

Q. Do you feed your cattle any substance that would be deleterious to health?

A. I will eat anything but the hay that my cattle get.

Q. I understood you to say that there was not now fed more than one-fifth of the cattle per annum that were fed at Peoria several years ago?

A. I judge not more than that.

Q. That is approximately correct?

A. Yes sir, it is so at my house.

6127 Q. Do you know how many bushels of corn you consume at your distillery during a year?

A. About a million bushels.

Q. Are there any chemicals used in your distillery that goes out in the offal out of the pens of the cattle, that finds its way into the Illinois river?

A. No chemicals used in distilling, whatever.

Q. Now in reference to the salt that is fed to the cattle, I suppose that has decreased in amount with the extent of the reduction in the number of cattle fed, has it not?

A. Not in the exact proportion; it takes more salt for cattle eating cotton-seed hulls in place of hay, than it does when they are fed hay.

Q. How much more does it take?

A. A quarter more.

Q. Then even assuming that it takes one-fourth more salt for the cattle under the present conditions than it formerly did, on account of the reduced number of cattle fed at the distillery, there is consequently still a very great reduction in the amount of salt consumed?

A. About two-thirds or three-fourths reduction.

Q. Mr. Clarke when you say that the water in the river is better now than it was before the canal was opened, you express that as your opinion depending upon the mechanical use
6128 of the water for the boilers and from your observation of the river?

A. That's the only way I have, yes sir.

Q. It is your opinion that the water in the river has become void of the impurities discharged into it at Peoria, by the time it reaches Copperas Creek dam?

A. It appears to me much before that.

Q. And that is simply your observation?

A. Yes sir.

Q. Was that also true prior to the opening of the canal?

A. Yes sir.

Q. Is there anything to your knowledge that is discharged from still houses in Peoria into the Illinois river that are injurious to health?

A. I don't think there is.

Q. As far as particular ingredients are concerned?

A. No sir.

Q. You are not an epidemiologist I suppose?

A. No.

RE-DIRECT-EXAMINATION,

By Mr. Todd.

Q. Mr. Jeffries asked you if the river water if used by you in the distillery would enter into the product, and you answered "No." Would any water whether received from the Illi-
6129 nois river or elsewhere enter into the product?

A. In some cheap whiskies, yes.

Q. But in the product that you manufacture?

A. Not at 100 proof,—not at absolute proof.

Q. And when water finds its way in whiskey, it is after the whiskey is made, is it not?

A. All except a very small percentage.

R. D. CLARKE.

Whereupon a recess was taken until 1:45 P. M., the same day at the same place, Friday, August 14, 1903.

6130 National Hotel, Peoria, Illinois.

1:45 P. M., Friday, August 14th, 1903.

Continuation after recess.

Present the Commissioner and the same counsel representing the respective parties.

LOUIS P. BAUER,

called as a witness in behalf of the defendants, being first duly sworn by the Commissioner, was examined in chief by Judge Johns and testified as follows:

Q. State your name, residence and occupation?

A. Louis P. Bauer; Superintendent of the Glucose sugar Refining Company, Peoria, Illinois. I reside at 224 Missouri Avenue.

Q. How long have you been superintendent of the guucose works here?

A. Since June, 1898.

Q. Where are the works situated with reference to the Illinois river?

A. They are situated within 500 feet of the shore of the Illinois river.

6131 Q. And in the city of Peoria?

A. And in the city of Peoria.

Q. What material is used in the manufacture of glucose?

A. Corn.

Q. How much corn do you use here each day?

A. On an average about 31,000 bushels.

Q. Have you been continuously in operation since January, 1900?

A. No sir.

Q. How much of the time have the works been idle?

A. About six weeks last year, I think it was about two months.

Q. What is the first process to which the corn is subjected?

A. It is steeped in a weak solution of sulphurous acid.

Q. Mixed of course with water?

A. Water.

Q. After the corn is steeped in the water, what becomes of this water?

A. It is concentrated in vacum apparatuses.

Q. What is taken out of the water by the concentration?

A. Well, there is pure water; pure water is taken out and the remainder in the concentrated state is mixed with feed.

6132 Q. When this water has gone through the concentration process what becomes of it?

A. Well the water becomes condensed and goes into the sewer.

Q. What color is it when it goes into the sewer?

A. Well there is no color to it. It is the same as going through a distilling process.

Q. After the corn is steeped, what do you do with it next?

A. Ground.

Q. In a wet state?

A. In a wet state.

Q. What is then done with it after it is ground?

A. First we separate the germ from the corn.

Q. What becomes of the germs?

A. From the germs we extract the oil.

Q. What becomes of the remainder of the germ?

A. The remainder of the germ is oil cake.

Q. After the germs are extracted what is done with the remainder of the ground product?

A. It is drawn through another grinding process; and is ground finer.

Q. Then what is done with this fine meal?

A. Then this mash passes over a silk bolting cloth. It passes through a stream of water which washes out the starch.

Q. After it comes into the form of starch do you use water
6133 upon it to wash it?

A. Yes.

Q. What becomes of the water which is used in washing the starch?

A. After the starch has been all settled off this water goes into the sewer.

Q. Has it a color and if so, what kind?

A. It is almost colorless, a little whitish, but almost colorless.

Q. What substance does it contain?

A. It contains a very small percentage of organic matters.

Q. Does it contain any percentage of acid?

A. Traces of acid.

Q. What kind of acid?

A. Sulphurous acid.

Q. Do you use water in this establishment for the purpose of washing out the rooms where the starch is dried?

A. We use water, not in the room where our starch is dried but in the room where the starch is separated from the water.

Q. For what purpose do you use it there?

A. For the purpose of washing the floors.

6134 Q. What becomes of the water used in washing the floors?

A. It goes into the sewer.

Q. Has it any color?

A. It has a whitish color.

Q. Is there any other refuse matter from your establishment than this water that runs into the sewer?

A. No sir.

Q. All the rest of the product you use in some form?

A. Yes sir.

Q. How many gallons of water a day do you use in the process of manufacturing glucose in your establishment?

A. We use altogether about six million gallons.

Q. From what source do you obtain the water?

A. About 1,000,000 from the river and the balance from wells.

Q. Where are these wells with reference to the Illinois river, how far away?

A. About one thousand feet; some are about 1000 feet and some about 800 feet.

Q. How deep are they?

A. About 32 feet.

Q. How many wells have you there?

A. Two, and then we have ponds besides, driven wells.

Q. How many driven wells have you?

6135 A. I think about ten.

Q. How deep are they?

A. I think they are forty feet, I don't know the exact depth of them they were there before my time.

Q. How far are the driven wells from the Illinois river?

A. About 800 feet.

Q. Are any part of your buildings subject to overflow in times of high water in the Illinois river?

A. No.

Q. Do you find any fluctuation or variation in the amount of water which you obtain from these various wells?

A. Well I find that the supply of these wells we are speaking of is bigger now than three years ago.

Q. Before the opening of the drainage canal, were you sometimes embarrassed by a short supply of water in these wells, an inadequate supply?

A. Yes sir, one summer we were.

Q. Since the opening of the drainage canal have you had any such trouble?

A. No sir.

Q. Does the amount of water in these wells vary with the height of the river?

A. I believe it does.

6136 Q. What kind of water did you use before the opening of the drainage canal for steaming purposes?

A. River water.

Q. What kind do you use since the opening of the canal?

A. Same thing.

Q. Do you filter the water before you use it for your boilers?

A. Yes sir.

Q. Before the opening of the drainage canal, did you sometimes use the river water direct for steaming purposes?

Objected to as leading.

A. Yes.

Q. Under what circumstances?

A. During times the filters were out of commission, when improvements were being made.

Q. What effect did the unfiltered water before the opening of the drainage canal have upon your boilers?

A. It caused them to foam.

Q. When they were cleaned out, after you were using the unfiltered water, what was found in the boilers?

A. A large amount of mud, soft mud.

Q. Since the opening of the drainage canal, do you some-
6137 times use the unfiltered water?

A. Yes sir.

Q. Under what circumstances?

A. Not long ago we had to renew the sand in those filters and a carload of sand was not shipped properly, and we had to wait for the sand about a week or two and during that time the filters were out of commission.

Q. Did you during that time use the unfiltered water?

A. Yes sir.

Q. How did that water act in your boilers?

A. There was nothing noticed; there was no foaming of the boilers.

Q. Do you use the river water for washing out the starch room, or the well water?

A. The well water.

Q. Which is the better water for manufacturing purposes in the Illinoios river, that before the opening of the drainage canal or that since?

A. After.

Q. Of the 6,000,000 gallons of water which you use each day how many gallons did you say are returned to the river through the sewers?

A. About the same amount.

6138 Q. How long has glucose been manufactured in Peoria?

A. I believe since 1878.

Q. Were the processes of manufacture formerly somewhat different than those now in use?

A. Yes sir.

Q. Was there formerly more solid matter discharged into the river through the sewers?

A. Yes sir, more or less.

Q. What kind of substance was that?

A. The gluten of the corn more or less starch and slop.

Q. Formerly were cattle fed at the glucose works?

A. Yes sir.

Q. About how many?

A. I do not know.

Q. When did they cease feeding cattle there to the best of your knowledge?

A. I do not know what year; I think about 1886.

Q. Are the glucose works at Pekin a branch of your works here or a separate institution?

A. Why, they belong to the Illinois Sugar Refining Company.

Q. Is that a separate institution from yours or are you all in the same institution?

A. Separate institutions.

Q. What is the substance which the glucose works at 6139 Pekin discharges into the river?

A. The Pekin factory does not concentrate its steep water; that is, they do now; they haven't done so until recently.

Q. And in that respect their manufacture is different from yours?

A. Yes sir.

Q. Before concentration, what is this steep water, what substances has it in it?

A. Well, it contains soluble part of the corn which consists of sugar, gluten and starch.

Q. Is that substance capable of dissolving in water or does it remain hard?

A. Yes, soluble in water. That is, there is only a certain amount of starch in the corn and a certain amount of gluten and the sugar that is soluble, and that is the stuff that undergoes the steeping process.

Q. What is the material deposited by the Pekin factory formerly, which creates a stench when exposed to the open air?

A. Well it is the substances contained in the steep-water that I mentioned before.

Q. How long since your factory here commenced the concentration of the steep-water?

A. About eight years ago.

Q. Prior to that time was the steep water discharged into the river?

6140 A. Yes sir.

Q. Do you know at that time what the capacity of the glucose works here was, as to the amount of corn used and their water consumption?

A. I think at that time it was about 12,000 to 15,000 bushels.

Q. Per day?

A. Per day.

Q. What is the capacity of the Pekin works now?

A. I don't know.

CROSS-EXAMINATION.

By Mr. Jeffries.

Q. Do you have anything to do with the Pekin works?

A. No sir.

Q. Now what is the correct name of the company that you are superintendent of here?

A. The Glucose Sugar Refining Company.

Q. When was the Glucose Sugar Refining Company organized?

A. I believe in 1896.

Q. Was it organized by the purchase of some other company or companies?

A. Yes sir.

6141 Q. What company was it the successor of?

A. The American Glucose Company.

Q. Any others?

A. Yes, the Rockford Sugar Refining Company.

Q. Is that all?

A. Well the Davenport Syrup Refining Company.

Q. Any other companies here in Peoria?

A. The Peoria Grape Sugar Company.

Q. Any others in Peoria?

A. No sir.

Q. Now the home office of your company is in New York is it not?

A. Chicago.

Q. The home office of the company down at Pekin is at New York?

A. Well I don't know as to that; they have got an office in the Rookery Building in Chicago.

Q. You say you have fed no cattle at the glucose works in Peoria since 1886?

A. Well I am not sure about that; possibly they have fed cattle here longer, but they didn't feed any after 1890.

Q. How long have you been connected with the company?

A. I made a mistake; they were organized in 1897. I have been connected with them since 1897.

6142 Q. There has been no cattle fed since you have been connected with it?

A. No sir.

Q. In your direct examination you say that there are traces of acid that go out into the water into the sewers?

A. Yes sir.

Q. What percentage of that material goes into the sewers—of that acid?

A. Of the total amount of water?

Q. Yes.

A. I should say about ten per cent. of the total amount of water.

Q. Yes, but the proportion of the acid to water then is ten per cent. is it?

A. No.

Q. That's what I am driving at?

A. No, about ten per cent. of the water that goes out of the factory contains traces of acid. I don't think it would be over about .001 part of a per cent.

Q. It is practically incapable of calculation is it not?

A. It can be calculated by chemical analysis.

6143 Q. Those traces are not sufficient to be observed with the eye are they?

A. You could only notice it by taste; you couldn't see it in the water.

Q. What did you say was the color of the water or matter that runs into the sewers?

A. Almost as clear as the river water.

Q. It is clearer than the river water, isn't it?

A. Not now.

Q. Of the six millions of gallons of water that you use in your factory per day, 1,000,000 of it is drawn from the river?

A. Yes sir.

Q. In what way do you use the water that comes from the river?

A. In a filtered way.

Q. Now that was both before and after the opening of the drainage canal?

A. Yes sir.

Q. Are there any solid matters passing out of the factory into the sewers in the water?

A. No sir.

Q. How is that avoided?

6144 A. Well by improved processes of operation.

Q. Processes of evaporation?

A. Yes sir, evaporation and separation.

Q. What do you do with the pulp or hull of the corn?

A. It is formed into feed.

Q. And all other materials that are not used in the preparation of the articles manufactured, go into the feed, do they not?

A. Yes sir. Well, the feed you know is a manufactured article too.

Q. Well, everything else, the refuse and everything of that kind goes into the feed?

A. Yes sir.

Q. Now you commenced to concentrate this water about eight years ago—the steep water?

A. Yes sir.

Q. That takes out all the solids, does it?

A. Yes sir.

Q. What article or product does the company of which you are superintendent, manufacture?

A. Well we manufacture glucose, starch, dextrine, oil and feed.

Q. Do you manufacture sugar?

A. Well yes, glucose and sugar are about the same. I may mention grape sugar.

6145 Q. Grape sugar is syrup, and sugar is solid glucose?

A. Yes sir.

Q. Now is there any other material deposited in the Illinois river by your company in the operation of its business, which you have not mentioned?

A. No sir.

Q. To what extent does the refuse and other material carried from your factory into the waters of the Illinois river, pollute that water?

A. I think to a very small extent.

Q. I will ask you if it isn't a fact within your knowledge in the last eight years, that there is less material, and being continually less material and offal deposited in the Illinois river at Peoria, than formerly?

A. Yes sir. It is less than eight years back.

Q. And has been gradually getting less all the time?

A. Yes sir. LOUIS P. BAUER.

6146 ADOLPH WOOLNER, JR.,

called as a witness in behalf of the defendants, being first duly sworn by the Commissioner, was examined in chief by Mr. Todd and testified as follows:

Q. What is your name?

A. Adolph Woolner, Jr.

Q. What is your business?

A. I am manager of the Woolner Distilling Company.

Q. What is the capacity of the Woolner Distilling Company?

A. Well, the Woolner Distilling Company is just in process of construction, but I have been manager of the Atlas Distillery for the past nine years.

Q. What is the capacity of that distillery?

A. 7,500 bushels in 24 hours.

Q. How long have you been connected with the distilling interests in Peoria?

A. Since 1880.

Q. Are you familiar with the methods employed here by the distilleries in feeding cattle?

A. Yes sir.

Q. Have you fed cattle yourself in your distillery?

A. Yes sir.

6147 Q. What number of cattle has been fed here in Peoria by the different distilleries during the last seven or eight years, including the present year?

A. There have been as high as 40,000 head of cattle fed at one time, but I think that is more than seven years ago.

Q. Well, say ten years.

A. I should judge—

Q. When did they feed 40,000 head of cattle here?

A. In 1887 or 1888 I think they fed 40,000 head of cattle.

Q. What number of cattle are being fed now?

A. I should think in the neighborhood of 10,000 head now.

Q. How many head are fed in Pekin?

A. I am not positive, but I think between 5,000 and 8,000 head; I am not sure.

Q. What are the cattle fed on?

A. They are fed on the waste material from the distillery after the alcohol has been distilled.

Q. Has it a name?

A. Well, it is called slop—distillery slop.

Q. How much slop will a steer eat in 24 hours?

A. We generally aim to feed them about a bushel to the head, of distill; a distilled bushel.

Q. How many gallons?

A. That would be about 40 gallons.

6148 Q. How many pounds in a gallon of that slop?

A. I should judge it would weigh in the neighborhood of ten pounds to the gallon.

Q. That would be how many pounds of slop fed to a steer in 24 hours?

A. That would be 400 pounds.

Q. Do you feed them anything else?

A. Yes, they receive besides the slop, about ten or eleven pounds of hay and a small amount of salt.

Q. Do you know how many tons of urine and feces are discharged by a steer in one year?

A. I suppose I could tell if I had time to figure it out.

Q. I wish you would figure it out.

A. (Witness computes.) The only way I can get at it is this, a steer will gain in eight months feeding very close onto 400 pounds. That is 240 days that they are on feed. During that 240 days he will consume 98,400 pounds of liquid and solid food. As there is only 400 pounds gain on the steer the balance naturally must pass away from him.

Q. It leaves 98,000 pounds for eight months feed?

A. Yes.

Q. And for twelve months it would amount to what?

6149 A. About 120,000 pounds; about sixty-odd ton a year.

Q. And what would be the discharge from 40,000 head of cattle?

A. Well, it would be just 40,000 times that amount? It would be 2,400,000 tons.

Q. That would represent the amount of excreta from 40,000 head of cattle, would it not?

MR. JEFFRIES: I object to the question because it is leading and an attempt to put the answer in the witness' mouth, and for the further reason that it is argumentative.

A. About that.

Q. How many tons of excreta would come from 18,000 cattle?

A. 1,080,000 about.

Q. How many from 10,000 cattle?

A. 600,000, about.

Q. What becomes of the urine and faecal discharge from the cattle that are fed here in the distilleries?

A. It is run into the river.

Q. What river?

A. Illinois river.

Q. Has that always been the custom here?

A. Yes, sir.

Q. So that the amount of pollution from the cattle-sheds of
Peoria from 1887 to the present, has varied from 2,400,000
6150 tons when 40,000 head of cattle were fed and 600,000 tons
when 10,000 head of cattle were fed, is that correct?

MR. JEFFRIES: Objected to because the question is leading, argumentative, and counsel answers the question himself without respect to what the witness might say.

A. About that.

Q. Were you familiar with the Illinois river before and since the opening of the drainage canal?

A. Yes, sir.

Q. Did you use the water of the Illinois river for steam-making purposes before the canal was opened?

A. Yes, sir.

Q. And since?

A. Yes, sir.

Q. How does its use since compare with its use before the opening of the drainage canal?

A. I think the water is some better for steam-making purposes.

Q. Did it foam before the opening of the canal?

A. We had some trouble with foaming water before.

Q. Have you had any since?

A. Since the canal has been opened we have had very little trouble.

6151 Q. Have you been upon the Illinois river before and since
the opening of the drainage canal?

A. I have.

Q. What was the condition of the water in the Illinois river, prior to the opening of the drainage canal, from Peoria above and from Peoria bridge below?

A. I do not think that we had as much current in the river before the drainage canal was opened, and the water was sluggish and stagnant, and had a bad appearance and considerable odor.

Q. Was the water any different above Peoria than it was below the Peoria bridge?

A. Well, I think there was some difference owing to the less current, it naturally made the sloughs rather stagnant.

Q. How about that section of the river that received the discharge from the distilleries and cattle-sheds before the opening of the drainage canal?

A. Well, at low water, it was in pretty bad shape.

Q. Did it have any aroma to it?

A. Why, there was some smell.

Q. How much of a smell?

A. It is very hard to judge, but there was some.

Q. How does the condition of the river today compare with the river before the opening of the drainage canal?

A. I don't think it is any worse; if anything, some better.

6152 Q. How about the clearness of the water?

A. I think it is some little clearer than it was before.

CROSS-EXAMINATION, by Mr. Jeffries.

Q. How many cattle did you say were fed annually at Peoria for the last eight years?

A. Well, since 1887 I can't state the exact number, but we have had as high as 5,000 head of cattle in the cattle-sheds at a time; it varies; some years more and some years less, but that was about the average.

Q. When was that?

A. 1887 or 1888.

Q. The number has been decreasing of late, has it not?

A. Yes, sir; they are feeding less than they ever have fed.

Q. How many were fed last year?

A. I don't think there were over 10,000 head fed in Peoria last year.

Q. How many have you fed in your company, the Atlas?

A. That has fed 2500 head for the past nine years. That is, about that.

Q. This new company that you are organizing, how many do you intend to feed?

A. We do not intend to feed any.

6153 Q. What are your intentions as to the disposition of the pulp in the new factory?

A. Intend to dry the feed, to dry the slop.

Q. And export it?

A. Yes, sir; export it and for domestic purposes.

Q. Your idea of the condition of the water in the Illinois river being better since the opening of the canal than it was prior thereto, is based upon what?

A. It is based on two reasons; the first reason that the amount of water that is being sent down from the canal gives the river a stronger current, which naturally clears the river better than when the river is sluggish; secondly, that there is less cattle being fed and will be fed; there is less refuse going into the river.

Q. Less cattle being fed where?

A. Here in Peoria.

ADOLPH WOOLNER, JR.

6154 D. S. BROWN, called as a witness in behalf of the defendants, being first duly sworn by the Commissioner, was examined in chief by Judge Johns, and testified as follows:

Q. State your name, residence and occupation?

A. D. S. Brown; 806 Glen Oak avenue, Peoria, Illinois; in the real estate and piano business.

Q. Have you formerly been a distiller in Peoria?

A. Yes, sir.

Q. When were you engaged in that business?

A. From 1876 to 1886.

Q. Where was your distillery?

A. About three miles from the courthouse down the river.

Q. From 1876 to 1886, how many distilleries were in operation in Peoria?

MR. JEFFRIES: I object to the question because it refers to the condition that existed long years before the opening of the Chicago drainage canal.

JUDGE JOHNS: In reply to which counsel for defendant State of Illinois, asks that in reference to the condition of the

Illinois river which was endured by the State of Missouri and the City of St. Louis for many years prior to the opening
6155 of the drainage canal.

MR. JEFFRIES: The statement of counsel is objected to for the reason that such endurance, if there be any, is not such as would justify the city of Chicago, or the Sanitary District thereof in the construction of the drainage canal and the discharge of the sewage from Chicago into the Illinois river?

(Question repeated.)

A. I couldn't remember to a certainty; I should think ten; possibly twelve, but I wouldn't be sure.

Q. What was the extent of the distillation of whiskey or spirits in that period as compared with the present time?

A. There is more distilled now; the larger revenue shows that.

Q. Were the distilleries then independent, each operating upon its own basis?

A. Yes, sir.

Q. What was the practice in regard to the slops mace in the process of distillation?

A. It was fed to the cattle.

Q. Much in the same manner as it is now?

A. I think many more cattle were fed then than now; some of the slop now is dried and sold as dry feed.

6156 Q. During that period what was done with the offal, fecal and urine, from the cattle?

A. It was run into the river.

Q. Were these distilleries at that time located near or on the river?

A. Yes, sir.

Q. How long have you been familiar with the condition of the Illinois river near Peoria?

A. Since 1876.

Q. Prior to the opening of the drainage canal, what was the condition of the water in the Illinois river above Peoria?

A. It was very bad, very offensive.

Q. Prior to the opening of the drainage canal, what was the condition of the river at Peoria and immediately below?

A. Bad and offensive.

Q. Describe in what way?

A. It showed the effects of stagnant water and emitted bad odors, and had a bad color.

Q. To what did you attribute the condition of the water at that time at and below Peoria?

A. To the Chicago sewage.

Q. To the Chicago sewage?

A. Yes, sir.

6157 Q. Now, below the sewage of Peoria, and after the sewage of Peoria was put in the river, and before the opening of the drainage canal, what was the condition of the Illinois river below Peoria?

A. It showed the effects of the distillery slop and the refuse from the cattle, in addition to the other.

Q. Was it offensive in its smell?

A. Yes, sir.

Q. How far below Peoria have you observed it before the opening of the drainage canal?

A. I went with my family to St. Louis on the boat, two trips; at different years.

Q. Do you own any property below Peoria?

A. Yes sir, just below Peoria, this side of Wesley City.

Q. Do you own property on both sides of the river?

A. Yes sir.

Q. Do you occasionally visit the property and did you notice the condition of the river at that point before the opening of the canal?

A. Yes sir.

Q. Describe its condition?

A. It showed the effects of sewage, had bad odor.

6158 Q. What was its color?

A. Well, an indescribable color, a dark, brown color.

Q. In the summer time was the odor offensive?

A. Yes sir.

Q. Since the opening of the drainage canal, what has been the condition of the water above Peoria?

A. Very good as compared with what it was before, and as I think with other rivers.

Q. In what respect is it better?

A. It is clearer, freer from the sewage and has a better color and no odor,—comparatively little odor.

Q. Since the opening of the drainage canal, what has been the condition of the Illinois river below Peoria?

A. I think it is far better than it was above Peoria before the opening of the canal.

Q. To what do you attribute this improvement in the condition of the water below Peoria?

A. The emptying in of the clear water from the lake.

Q. And the larger amount of water passing down the river?

A. Yes sir.

Q. What effect if any, in your judgment, has the opening of the drainage canal, had upon the value of lands, adjoining and in the vicinity of the Illinois river?

A. I think it has increased the value.

6159 Q. In what manner?

A. It is surer of a cleaner river, a steadier current, better transportation and a healthier river to live by.

Q. Did you consider the Illinois river immediately below Peoria and lands in the immediate vicinity of it, dangerous for habitation before the opening of the drainage canal?

A. I considered it unhealthy.

Q. Since the opening of the drainage canal, in the same vicinity below Peoria do you consider the situation and surroundings more healthy than before?

A. Yes sir.

Q. Is it on that account that you say the lands have become more valuable?

A. Yes sir. And on account of the statement I made to your previous question.

CROSS-EXAMINATION,

By Mr. Jeffries.

Q. Mr. Brown, don't you know that since the opening of the canal transportation on the Illinois river has not increased to any considerable extent?

A. No sir, I don't know that.

Q. You are not acquainted then with that fact?

6160 A. I am not acquainted with that fact; I had supposed from all appearances that it had increased.

Q. You are not engaged in that business?

A. No sir; I live in sight of the river all the time and see what was going on and I supposed it had increased.

Q. Did I understand you to say that the bad condition of the water of the Illinois river at Peoria and above Peoria prior to the opening of the canal was caused by the sewage of Chicago?

A. I think so.

Q. Then if the sewage of Chicago came down the river before the canal was opened, why doesn't it come now?

A. I think that the motion of the water that has a greater current aerates it and clears it. There was a sluggish slow motion before that that was to our damage; while it was brought along in some flood tide and high water, this low water didn't give it motion enough to clear the water. Now we have a good current and the water seems to be clear and good.

A. A rapid current would bring it down quicker than a slow current, wouldn't it?

A. I think that a rapid current—

Q. Well, answer the question?

A. No sir, I don't think it would. That is, I don't believe
6161 it would bring it to here. A flood tide would bring it here; a rapid current would bring it here, but I don't believe it would clear the water like a steady, flowing current; I lived all my early life by a river in Massachusetts and I have seen the effects of the current, of the steady current and the low waters of summer and the high waters of winter seasons and I saw what effect it had upon the water, the waters that are used for drinking purposes, and I am satisfied that a good steady current will clear the water in a certain distance making it better than it woud be if it was a slow current, sluggish, lay along for months and then come a flood tide and carry it on down and then leave it again to spoil or decay, making the river bad. I am pretty sure that a steady, good current, will make clear water.

Q. If it would come down in flood time prior to the opening of the canal, would it come down yet?

A. They pump in Chicago the sewage into the canal, into the river, before the water brought it along regularly—

Q. Answer the question directly, Yes or No.

A. I will if I can.

Q. (Question repeated).

A. I think I explained that before—

Q. You say it would not; that question is capable of being
6162 answered yes or No.

A. No it wouldn't be there to be brought down; it would be there and be aerated by the motion of the water and wouldn't be brought here. In flood time that wouldn't be a steady current and it would come down during high water and be left.

Q. Don't you know Mr. Brown, that a very inconsiderable portion of the sewage discharged into the old Illinois and Michigan Canal and that a great proportion of it before the opening of the Chicago Drainage Canal was discharged into the Chicago River and thence into Lake Michigan, and that it was because of the pollution of the lake water, that the Chicago drainage canal was constructed in order to purify their own water and send that sewage down the Illinois river? Answer that Yes or No.

A. I will say No. I would like to explain my "No," if I can do it.

Q. You can explain on re-direct examination. Don't you know that that was the object of the construction of the drainage canal?

A. No sir.

Q. You don't know what the object was then?

A. Yes sir.

Q. How often were you down the river?

A. I made two family trips down the river.

6163 Q. When was that?

A. That was between 1876 and 1886 when I was in the distillery business.

Q. Have you made a trip down the Illinois river in the last eight years?

A. No sir; I am going down. If the water wasn't better I wouldn't go down though.

Q. Do you know whether disease germs will live in running water or not?

A. I think they will; I don't think they multiply as rapidly in running water as they do in sluggish water.

Q. Well, do you know anything about it?

A. My experience with them has been very limited. I belong to the Scientific Society and have seen them illustrated; the germs of the river water in the Illinois river at Peoria, under the magnifying glass, and know as much about them as a common business man would know I think, and no more.

Q. But you haven't a professional education on that line?

A. No, sir.

Q. Do you consider your judgment and opinion on that subject as good as any other ordinary business man?

A. I see no reason why it shouldn't be.

6164 RE-DIRECT EXAMINATION, by Judge Springer.

Q. Now, Mr. Brown, explain what you desired to explain in your answer.

MR. JEFFRIES: I object to any explanation being given by the witness with reference to the purpose and construction of the drainage canal and with reference to testimony from him on the transportation of the sewage from Chicago down the Illinois river for the reason that the witness has disqualified himself as being competent to testify on that subject for the reason that he stated in evidence that he has no scientific knowledge upon which his statements may be based, and whatever he might say on the subject would be the ideas of fancy without reference to the actual facts, conditions and circumstances, and without reference and without the aid of scientific knowledge on the subject.

JUDGE SPRINGER: In reply to this objection, counsel for defendants insist that the witness having been required to answer the question Yes or No, that he answered No and asks the privilege of explaining his answer, and by every rule of evidence he is entitled to make that explanation.

MR. JEFFRIES: I suggest that the question was asked for the sole and single purpose of ascertaining knowledge upon the part of the witness as to the purpose of the Sanitary 6165 District of Chicago in the construction of the canal, and that any other answer than that of Yes or No, would not and cannot now in explanation thereof, be responsive to the question.

Q. (Question read.)

A. I answered No, for I believe that it is—

MR. JEFFRIES: I object to what the witness believes; I object to the witness stating what he believes, he must confine himself to actual conditions.

Q. JUDGE SPRINGER: You may explain your answer now as you desire?

A. The City of Chicago was pumping its entire sewage into the Illinois river; that if it could have been pumped cheaper, the amount of water that is being turned into the canal could have been pumped cheaper than the canal cost, that it never would have been built. They built the canal because that was the cheapest way of getting the sewage into the canal with the proper quantity of water it should have with it. Previous to that they were not pumping the proper quantity of water; the sewage was lying by the sides of the river at the upper end and it was obnoxious and was brought down in flood tide in chunks. If they had pumped the proper amount of water that should have gone with that sewage, all the time, the river would 6166 then have been good and clean and more healthy, and my answer No, was that they built the canal because it was cheaper than they could pump the amount of water that would have been necessary to have carried down the sewage, and not allow it to run into the lake.

RE-CROSS-EXAMINATION, by Mr. Jeffries.

Q. Why didn't they want it to go into the lake?

A. It would damage their water supply; it had damaged their water supply for years and they had to make their current the other way, which they did.

Q. Then it is not true that the entire sewage from Chicago had been coming down the river before the opening of the canal?

A. Well, as much of it as comes down now, or very nearly as much. They are going to turn in more I think and turn in more water from the other canal, from the other sewers.

Q. Do you state to be a fact that they are turning no more sewage into the Illinois river now since the opening of the drainage canal than they did before the opening of the canal?

A. As far as the Chicago river is concerned, that sewage I don't know whether they have turned any other sewage into this. I understand that they are anticipating doing so.

6167 Q. I am talking about what you know; you are testifying on oath, and I want to know what you absolutely know and nothing else?

A. I don't know that. They may have opened a sewer yesterday. I understand that they are figuring on turning some additional sewage in, but I do understand they were pumping that from the Chicago river down into this canal before, and that is what is coming down now.

Q. All the Chicago river?

A. Yes, sir; all the sewage that went into the Chicago river. They had to do that or it would have gone out to the water supply. They had to keep the water away from the water supply.

Q. Then sewage going into the lake from Chicago prior to the opening of the canal would contaminate the lake water, but it won't contaminate the water when it comes down the Illinois river; is that your position?

A. If they would run it 150 miles out into the lake, I don't think that would hurt it. I think I would be perfectly satisfied to drink a little water 150 miles out in the lake; but four miles out in the crib, I would not and I would not want to drink water four miles below St. Louis.

6168 Q. How long prior to the opening of the canal did they pump all the sewage into the Chicago river and thence into the Illinois and Michigan canal?

A. I don't know exactly; I couldn't tell you. I think four or five or six years. I judge that from the time that it was first reported as shown at the crib.

Q. And they have had good water in Chicago ever since?

A. Since the canal was opened?

Q. No, since they ceased pumping their sewage into the Illinois and Michigan canal?

A. Oh, they haven't had good water. I don't think it was perfect as it is now, but I think now they have cleaned all the bad water that was in the Chicago river and it has had its effect even on the atmosphere.

Q. Can you describe the Chicago river?

A. Now?

Q. No, generally, the way it runs, the different forks; do you know anything about it?

A. I know how it shows on the map; I don't know the directions when I am on it; that is, I don't know all of the turns, but I know the river pretty well, because I am often along by it. I had a friend that was in business in the Northwestern there, right on the banks of it.

6169 Q. How many forks are there to the river?

A. Two main forks.

Q. Where are the pumps that are used to pump the water from the Chicago river into the Illinois and Michigan canal located?

A. I know the place, but I don't know what you call it.

Q. What fork is it on?

A. It is on the north fork of the Desplaines river, but I don't know whether you call it the north fork or not; I don't know which of the forks you call it.

Q. Don't you know that before the Chicago drainage canal was constructed and opened that the waters in the Chicago river ran into the lake and emptied and discharged into Lake Michigan?

A. If there was current enough in it to show it, I didn't see it.

Q. Then if it did not discharge into the lake, how could it pollute the water in the lake?

A. It had for years discharged into the lake; many times when they were not running the pumping works, it had to discharge into the lake. Many times the works were stopped, broken down and many times it was running before the pumping works were started, and when it got to the crib, if I understand they had to pump it out.

Q. Then if the pumps are broken down at times and it did
6170 run into the lake, they have been sending more sewage down the Illinois river since the opening of the drainage canal than they did before. One of the two propositions must be true, is it not?

A. I think they must have sent all they collected on the edge of the lake and in the river, down through that canal which had been collecting there for years, but now we have the regular sewage of Chicago and the water in good shape.

DELOSS S. BROWN.

6171 SOLOMON YORK, called as a witness in behalf of the defendants, being first duly sworn by the Commissioner was examined in chief by Judge Johns and testified as follows:

Q. State your name, residence and occupation?

A. Solomon York; my occupation is steamboating; my residence is Peoria.

Q. Are you a licensed pilot and captain?

A. Yes, sir; have been for the last 34 years.

Q. How long have you been on the Illinois river in that time?

A. In 1852 I came on the Illinois river, when I was four years old.

Q. How long have you been a boatman upon the Illinois river?

A. Well, I boated, you might say ever since I was that old. My father was a boatman before me and I have never done anything else since but boat.

Q. Are you familiar with the Illinois river from La Salle to Grafton?

A. Yes, sir.

6172 Q. For ten years prior to the opening of the drainage canal in 1900, what was the condition of the Illinois river water above Peoria?

A. Well, it was bad.

Q. In what respect?

A. In regard to no current in the river and it was stagnant. Well, it was a scum on it good many times in dead, low water, and at times the growth in it would take the wheels of the boat that was turning over 25 or 30 revolutions a minute till a kind of whiskers would grow on it, we called it, a kind of a hair that long (indicating) would grow; I have seen it that long on the bucket, about four or five inches; that would grow on the bucket and the hull of the boat would have moss or hair up along on the side of the boat.

Q. How was it for steaming purposes above Peoria before the opening of the drainage canal?

A. It was no different from what it is now.

Q. Did it froth or foam in the boilers?

A. We never had it foam; the water never foamed.

Q. Before the opening of the drainage canal how was the water below Peoria?

A. Well, it was very bad below Peoria on account of the
sewage here; take it from here to Havana, down as far as
6173 Beardstown, you could see the offal from the distilleries
here; we worked for a boat down here in front of the distilleries three or four years down here digging that out and starting it on down the river; go into it with the wheel and dig it out; it would pile up there eight or ten feet deep.

Q. Below LaGrange dam before the opening of the drainage canal what was the condition of the water?

A. Very bad.

Q. Did it still have traces of the Peoria sewage in it below LaGrange?

A. Yes, sir.

Q. Since the opening of the drainage canal what has been the condition of the water above Peoria?

A. Well, it has been better, there is a great deal better current in the river and it makes it better.

Q. Is it cleaner, purer water?

A. Yes, sir, it is; I know it is.

Q. Since the opening of the drainage canal what has been the condition of the water below Peoria?

A. Well, it has been better; we have got more water; eighteen to twenty inches more water, which makes a current in the river.

Q. That scatters this sewage until it finally disappears, does it?

A. Yes, sir.

6174 Q. By the time you get down to LaGrange dam does it
disappear now?

A. Yes, sir; it gets purer, purified. You take the water that goes below Joliet, twelve or fifteen miles, it is clear.

Q. That is to say, the further you get away from the source of pollution the clearer the water gets and the purer?

A. Yes, sir.

CROSS-EXAMINATION, by Mr. Jeffries.

Q. You don't know anything about the sanitary condition of water, do you?

A. No, sir.

Q. And what you have said in reference to it is simply your observation of the river by being upon it?

A. Yes, sir, by being upon it.

SOLOMON YORK.

6175 National Hotel, Peoria, Illinois. 9:00 a. m., Saturday, August 15th, 1903. Continuation pursuant to adjournment.

Present, the Commissioner and same counsel representing the respective parties.

J. F. VINCENT, called as a witness in behalf of the defendants, being first duly sworn by the Commissioner, was examined in chief by Judge Johns and testified as follows:

Q. State your name, residence and occupation?

A. J. F. Vincent; I live at 415 Sixth street; my business is manager of the Peoria Union Stock Yards.

Q. What is the Peoria Union Stock Yards, a corporation, partnership or a private enterprise?

A. Well, they are owned by a company here, it is not a corporation—myself and my partner run them.

Q. How long have you been manager of the stock yards?

A. Well, I have been operating them under this lease, for I think about fourteen years.

6176 Q. What is the area of the stock yards?

A. Well, the stock yards company owns 22 acres altogether; part of that is taken up for packing houses and other purposes of that kind, and the part that I operate as stock yards is, I think, seven acres.

Q. Into what do the stock yards drain the sewers of the city?

A. We drain into the city sewers.

Q. And there are catch basins or inlets from the various pens of the stock yards to the sewers?

A. The pens, most of them, all of them, have an outlet from the watering trough, where we water the stock; when we empty those troughs there is an outlet to get into the sewers, from the waste water of the watering troughs, and there is a few of the pens that have inlets into the sewer to carry off the surface water, for instance, a rain like this, [a hard rain prevails as the witness is testifying], anything that comes like this it carries off. These pens that have these inlets to the sewer that carry the surface water are open pens and not floored; simply cinder foundations, and the pens that have the outlets simply from the water troughs are covered pens so that they don't catch any surface water.

6177 Q. How many cattle pass through these stock yards and have passed through them annually since 1897?

A. Well, I should judge probably an average of 50 a day. You see, we don't handle any cattle here except what our slaughterers handle; we don't handle cattle like these other places; just what the city handles; in fact, all of them don't come through the stock yards because they buy a good many cattle, you know, of what they call quarantined cattle, you know, and then they have chutes right at the packing houses to unload them and they don't come through the yards at all.

Q. Are these stock yards used also for the unloading and feeding of stock in transit?

A. Yes, sir, they are.

Q. How many cattle are passed through the stock yards which are simply fed here in transit, each year?

A. It probably wouldn't average more than two or three loads a week.

Q. Would that be 50 cattle a week?

A. Probably that, yes. We used to, a good many years ago, have a great many more than that when the western roads run this way in place of as they do now; for instance, the K. & W., we call it, running from Keokuk west, used to come to Keokuk and then run over the T., P. & W. to Peoria and then out to Chicago.

6178 Q. How many hogs are passed through these stock yards each year, since 1897?

A. Well, since then we run all the way from 300 hogs a day to probably 2,000 a day, an average of about 800 hogs a day would be about an average of what would run through.

Q. How many sheep?

A. Very few; probably wouldn't average over 150 a month.

Q. How many slaughtering houses are there in the vicinity of the stock yards?

A. There are two.

Q. What class of animals do they slaughter?

A. They slaughter cattle, hogs and a few sheep.

Q. Have they been running continuously since January, 1900?

A. One of the houses has run continuously for I should judge in the neighborhood of twelve years; the other has run for about eight years except two years it was standing idle; up to about two years ago. It was standing idle before that for two years.

Q. How many hogs do they kill each day?

A. The Goodel House will average about 500 a week and the other house I think may be might average 600.

Q. Into what does the sewage of these two slaughtering houses enter?

6179 A. One of them enters the city sewer; the city sewer runs right under the house and the other one has a private sewer from their place to the river.

CROSS-EXAMINATION, by Mr. Jeffries.

Q. How many cattle, hogs and sheep pass through the stock yards annually?

A. I think, as I stated here, the cattle run about 50 a day and about 50 a week of through cattle, just put off in transit to feed, and I think the average of hogs is about 800 a day through the year.

Q. Peoria is not situated on any trunk line, is it?

A. No, sir; there is no railroad that you can call a trunk line through here.

Q. And therefore there are very few through cattle passing through here?

A. That is one reason why there is very few through cattle, the reason of that mainly is, take the cattle going from the west, they don't pass through here at all, and the cattle that are in our territory here that are destined to Chicago don't have any occasion to stop after they load them; they go right through.

6180 Q. Now, that is also true with reference to the hogs and sheep?

A. All hogs that come here come here for sale; that is, we have more of a hog market than we have of a cattle market; that is, take the big head of cattle; we don't make any pretentions of having them at all; we simply have a market for butcher cattle, such as are slaughtered here in Peoria.

Q. How many hogs pass through the stock yards here in a day?

A. Well, about 800, I think, on the average take it the year through.

Q. And how many sheep?

A. Well, our sheep business is virtually so small that it is very hard to get at; our killers here handle very few of them; they might average, say 200 a month; I think that would cover it fully.

Q. Any horses handled at the stock yards?

A. Yes, sir, a few.

Q. How many will they average throughout a year?

A. Well, I judge may be a hundred a month.

Q. Now, are there any diseased animals of any kind taken into the stock yards?

A. No, sir, there is not anything; for instance, if we know there is any disease we don't take them into the yards. There is occasionally a lump-jaw steer, something of that kind, comes in, or a steer that will have a blemish on him or something 6181 like that. They are inspected after they come into the yards.

Q. After they are inspected and found to be diseased, what is done with them?

A. Well, if they are found to be diseased, beyond being fit for use they are slaughtered and tanked—rendered out for grease purposes.

Q. How far did you say these stock yards were located from the river?

A. The stock yards proper is in the neighborhood of 400 feet; but the stock yards property—that is, the company owns the property clear to the river. These packing houses are between the river and the stock yards.

Q. What do you feed at the stock yards?

A. Corn, oats and hay. All dry feed.

J. F. VINCENT.

6182 FREDERICK KINSINGER, called as a witness in behalf of the defendents, being first duly sworn by the Commissioner, was examined in chief by Mr. Todd and testified as follows:

Q. What is your name?

A. Frederick Kinsinger.

Q. What is your business?

A. I am manager of the American Spirits Manufacturing Company.

Q. How many distilleries are there connected with that company in Peoria?

A. Directly in Peoria there are three houses.

Q. What are they?

A. The Monarch, The Great Western and The Atlas.

Q. What is the combined capacity of the three houses?

A. 25,500 bushels a day.

Q. How many cattle are fed in these three distilleries?

A. We don't feed in but one.

Q. How many are fed in that one?

A. Well, it varies; I would say it averages about 4,000.

Q. Are there any distilleries in Pekin operated under this same company?

A. Yes, sir, one.

6183 Q. How many cattle are fed there?

A. I think about 3,000 at present. I am not positive, but that is my judgment.

Q. These cattle are fed the slops from the distillery, are they not?

A. Yes, sir.

Q. What becomes of the excreta?

A. It runs into the river?

Q. Is there any sewage discharged into the river from other distilleries?

A. Yes, sir; there is the waste water sewers.

Q. What is this waste water sewage?

A. Well, it consists of the overflow from the condensers, principally.

Q. And is made up from what?

A. River water, that is portions of the river water. I will explain to you that the river water has less scale in it than well water and it is advisable when we can use it at the temperature we need, to use the river water.

Q. Does the sewage from the other distilleries contain any foreign substances in the water?

A. Nothing in the water that is objectionable; that is, there is nothing foreign in it except the water itself after it has been heated; it contains no refuse of any kind.

6184 Q. What becomes of the slop that is produced in the other distilleries?

A. We dry them by a drying process into feed and ship it, and the same is true where the cattle are fed, too. The slop there is not all fed, you know.

Q. Where do you get the water from that is used in the distilleries for condensation and steam purposes?

A. From the river.

Q. What is the quality of that water for that purpose?

A. It is first class for the boilers.

Q. Is it used for any other purpose than steam-making purposes?

A. For condensing; that is, certain condensers that you don't have to go below the temperature of these waters.

Q. How long have you been in Peoria?

A. Two years past.

CROSS-EXAMINATION, by Mr. Jeffries.

Q. How long did you say you have been here in Peoria?

A. Two years last June.

Q. What business did you say you were engaged in before you came here?

Q. Distilling business.

6185 At what point?

A. I was supervisor of the Sixth Kentucky district; also I had a house immediately under my charge which I am still running there; the Milldale of Kentucky.

Q. What position did you say you occupied with reference to the plants here?

A. General manager.

Q. What is the name of the plant that is controlled by this same company at Pekin?

A. The Globe.

Q. Your main office is in New York, is it?

A. Yes, sir.

Q. The company owns various other distilleries besides this one here and the one in Pekin?

A. About seventy—in Kentucky, at Omaha, Terre Haute, Chicago, Cincinnati.

Q. You say they have fed cattle in one of these stills that you are superintendent of since you have been here?

A. Yes, sir.

Q. And that is which one?

A. The Great Western.

Q. How many cattle have you fed since you have been here, per year?

6186 A. Well, it varies, you know; I suppose the average would be about 4,000 at a time.

Q. The cattle that are fed do not belong to the company?

A. No.

Q. You simply sell the slop?

A. Sell the slop.

Q. The contract that you have for the sale of the slop has not expired, has it, yet?

A. The new one, I think, has begun.

Q. Your new contract has not been closed?

A. I think it has; I am not positive; that is closed in New York, you know. They have a right under that contract to decrease or increase when ever they choose; the feeder has, and of course whenever he decreases, we dry that much more, and when he wants more, we dry that much less.

Q. Don't you know as a matter of fact, that no new contract is intended to be entered into by your company and that they intend to discontinue the feeding of cattle altogether in the still houses here at Peoria?

A. No, sir.

Q. That is, you don't know whether that is true or not?

A. No, sir.

Q. The water that runs from the stills to the river in the process of distillation and otherwise, is it contaminated 6187 in any way, chemically or otherwise?

A. Well not that is objectionable for the purposes that we use it for, for instance in cooking with it, it is subjected to such a high temperature that anything foreign in it would be precipitated.

Q. No chemicals used in distillation, are there?

A. No sir.

Q. No ingredients other than the grain that you use in the process?

A. And yeast and hops.

Q. Then hops and grain are all?

A. Yes sir.

Q. How far is this Great Western Company from the river?

A. It is right on the bank; there is just the railroad between them and the river.

Q. How many cattle have you there now?

A. I think there is less than 4,000.

F. KINSINGER.

6188 FRANK C. WHITE,

called as a witness in behalf of the defendants, being first duly sworn by the Commissioner, was examined in chief by Judge Johns and testtified as follows:

Q. State your name, residence and occupation?

A. Frank C. White; residence, Peoria; occupation, dealer in live stock.

Q. Do you feed cattle at the distilleries in Peoria?

A. Yes sir.

Q. What is the style of your firm at present?

A. The cattle feeding firm, is Doud & Keefer, F. C. White & Company are partners in that firm; that is in feeding the cattle.

Q. At what distillery do you feed here?

A. We are feeding at the Atlas Distillery. At present we are getting the slops from the Corning Distillery, but our contract is with the Atlas; when they closed down the last two months we got slop from Cornings.

Q. How long have you been engaged in that business?

A. Twenty years; that is 20 years in the cattle feeding business; 30 years in the live stock business.

Q. Have you fed at other places than Peoria?

6189 A. For two years I had charge of Nelson Morris' Cattle all over the country, that is the cattle feeding in distilleries all over the country from Pittsburgh, on the east, Omaha on the west, St. Paul on the North, and Kentucky on the south, and one year I had charge of as high as 50,000 cattle.

Q. How many cattle have you been feeding for the last three years in Peoria?

A. Well you mean at one time?

Q. Yes?

A. From 2500 to 3,000 cattle.

Q. Have you continuously been feeding about that number during that time?

A. Well, in the winter season yes; in the summer season it runs down; we have about half the number of cattle we have in the winter season.

Q. Describe the process of feeding the cattle?

A. Well, they get their first feed of slop in the morning at six o'clock; after about eight o'clock they get their hay; then the barn is scraped down, the sewage all run out. At eleven o'clock they get their second feed of slop; after that they are hayed and the barn is scraped down again, and about five o'clock the last feed of slop.

Q. What do you mean by scraping down the barn?

6190 A. The men take a rubber scraper and scrape the urine and manure in the sewer; there is running water in the sewer all the time, while they are scraping and probably three parts of water to one part of sewage; I couldn't estimate exactly, but I should say at a rough guess that is it. Naturally the men will use as much water as they possibly can, so as to make the labor of scraping down easier.

Q. How much offal is there from a steer in a day in your judgment, urine and manure?

A. Well, the chances are that all the way from ten to fifteen gallons of urine and I don't see how it could be to exceed six or seven pounds of solids.

Q. Is this offal all washed away from the barns into the sewers?

A. Yes sir.

Q. What solid matter do you feed the cattle?

A. We feed cotton-seed hulls and hay; we estimate that we feed probably about eight pounds of hay or cotton-seed hulls per day; those are the only solids that we feed, so that in estimating the amount of manure I would safely say it couldn't exceed six or seven pounds for the reason the rest of it is absorbed.

Q. Where is the hay and cotton seed placed to be fed to the cattle?

6191 A. Placed on a platform right in front of the cattle; the cattle stand facing one another and the slop runs down right next to the cattle, and between the cattle and the platform, the hay put on that.

Q. What becomes of the refuse of the hay and cotton-seed hulls?

A. Whatever is left on the platform that the cattle don't eat is forked off and carted away.

Q. Is any solid matter washed into the sewers when you clean the sheds, except the manure?

A. No sir.

Q. Where is this other solid matter taken?

A. We put it out in the lot and the farmers come around during the year and haul it off.

Q. Where is the sewage from the cattle sheds deposited finally?

A. In the Illinois river.

Q. Prior to the opening of the drainage canal, did this distillery discharge accumulate and be washed off by the high waters, into the Illinois River?

A. Yes sir, it would accumulate and remain there for some time, even some springs it wouldn't have sufficient raise or sufficient water to wash it off and it would remain there during the whole season.

6192 There was times when it was a good deal of stagnant slop and manure that accumulated and remained there. We haven't been troubled that way for the last two or three years.

Q. Formerly, did this matter settle in the bottom of the Illinois river and was it dislodged by sending steam boats in to stir it up?

A. Yes sir; in fact, it is my impression now that they are forced to do that every year.

MR. JEFFRIES: I move to strike out what the witness says is his impression as not being based on absolute knowledge.

Q. Is any salt fed to the cattle in the distilleries?

A. Yes sir.

Q. In what quantities; what quantities of salt do you use per day?

A. Well I might say two table-spoons full; the men take it in the hand and give just a dash in front of each steer. Of course we watch the cattle very carefully and see how they are manuring, and if the manure is tight we salt a little more freely; when the manure is moving freely and not hard, why we know that they are receiving the proper amount of salt. New cattle off of the ranges require a little more salt to start with than cattle that are on feed two or three weeks.

6193 Q. Do you know of a disease among cattle called anthrax?

A. Yes sir, I have heard of it.

Q. Has there been any such disease among the cattle that you have handled here in Peoria?

A. Not in Peoria. I have had some experience with cattle in Omaha, that the veterinarians, claimed the sickness was anthrax.

MR. JEFFRIES: I move to strike out the testimony of the witness with reference to the cause of the sickness in the last answer as being merely hearsay testimony and the witness not being sufficiently informed on that subject to determine for himself whether or not that was the character and nature of the disease?

Q. When was that?

A. 1892.

Q. Now to what did you attribute that disease?

MR. JEFFRIES: I object to the question for the reason that the witness has not qualified himself as being proficient to express an opinion as to the cause of the disease and has already stated that he only knew what he had been told in reference to it.

A. I will say this much; that I didn't agree with the veterinarians at that time. I thought it was caused by sewer gas.

6194 Q. Were there any surroundings of the sheds at Omaha which led you to that belief?

A. There was a large smelter just above there, and in my opinion the poisonous gases got into sewers and up into the barn and cattle.

Q. Now if anything was done at that stage, to stop the escape of sewer gas into your cattle barns, state what was done and what the effect of it was?

A. When I got there they were losing from 25 to 35 cattle per day. I tried to doctor them with medicine, but came to the conclusion that the trouble was caused by poisonous gases, and I had the cattle removed. Part of them coming to the distilleries here in Peoria; part of them going to Mr. Morris' ranch in Nebraska, about 35 miles above Omaha. After the cattle were removed, we lost none. Later on they cemented the floor of the barn and they haven't had the same trouble with the barn since. That same season after the ground was froze up we put cattle in there without any cement, and took them out in the spring before the ground was thoroughly thawed up and we lost no cattle.

6195 MR. JEFFRIES: I move to strike out the question and answer for the reason that it is incompetent, irrelevant and immaterial and has no bearing on the issues involved in this case, and for the further reason that the witness is not qualified to give any opinion as to the disease.

Q. Upon what river is Omaha?

A. The Missouri river.

Q. Did the sewage from these barns in which these alleged diseased anthrax cattle were, enter into the Missouri river?

A. Yes sir.

MR. JEFFRIES: I move to strike out the question and answer because it is immaterial and incompetent. And because such facts will not in any manner justify such discharges into the Illinois river from the city of Chicago and for the further reason that such facts do not prove that the water in the Illinois river is wholesome and suitable for domestic and drinking purposes and do not prove or tend to prove any direct issue involved in this case.

CROSS-EXAMINATION,
By Mr. Jeffries.

Q. The number of cattle that are being fed at Peoria is growing less each year is it not?

6196 A. There was I think last year about 11,000 fed against 27,000 to 30,000 fed here ten years ago.

Q. The distilling business, however, is not decreasing, is it?

A. The capacity I think isn't nearly as great as it was. The number of houses isn't as great; the houses are bigger and larger.

Q. You are not a veterinary surgeon are you?

A. No sir.

Q. Your contract with the Distilling Company for the feeding of the stock is about expired, is it not?

A. Our contract has expired.

Q. And you are not feeding any more?

A. Well we still have cattle in the distillery; just a limited contract, you might say, running from day to day or month to month. We are allowed to give notice at any time.

FRANK C. WHITE.

Whereupon an adjournment was taken until Monday, August 17th, at 11 A. M., at La Salle, Illinois.

6197 La Salle, Illinois, Monday, August 17th, 1903. 11:00 a. m. Parties met pursuant to adjournment.

Present, the Commissioner and same counsel representing the respective parties.

It is agreed by counsel representing the State of Missouri and the State of Illinois and the Sanitary District of Chicago, that the testimony of witnesses taken at La Salle, Ottawa, Marseilles and Morris, all in the state of Illinois, may be taken in shorthand by the stenographers, the signature of each witness to his testimony is hereby waived, and the Commissioner is to certify all testimony so taken and transcribed by the stenographers to the Supreme Court, without signatures of the witnesses, making such corrections as he deems fit and proper, and the testimony so taken and certified to by the Commissioner to have the same effect as if signed by the respective witnesses.

FRANK S. BRIGHT, Commissioner.

6198 ROMAN J. RIMMELE, called as a witness in behalf of the defendants, being first duly sworn by the Commissioner, was examined in chief by Mr. Todd and testified as follows:

Q. What is your name?

A. Roman J. Rimmele.

Q. Where do you live?

A. La Salle, Illinois.

Q. What is your business?

A. Tinner.

Q. Are you acquainted with the Illinois river at this point?

A. Yes, sir.

Q. How long have you been acquainted with the Illinois river?

A. Why, I have been on it for—off and on it, up and down it from a child; I was born and raised right in the town here, that is 46 or 47 years.

Q. How often are you on the river?

A. Well, some weeks two or three times; some weeks every evening; some times not once a week.

Q. What are you doing on the river?

A. Why, running a little launch, running parties up and down the river.

Q. Excursion parties?

6199 A. Little parties, yes, sir.

Q. How far up the river do you go?

A. Well, I don't go further than a mile above Starved Rock; we figure that about 11.8 miles up and around the river,—is what they figure it.

Q. Were you acquainted with the condition of the Illinois river before the opening of the drainage canal?

A. Yes, sir.

Q. In 1900?

A. Yes, sir.

Q. Will you describe the condition of the Illinois river prior to the opening of the drainage canal?

A. Well, the water used to be very low, and kind of—as near as I could call it, dirty looking color, and floating grass and weeds all the time; hardly any current at all except in high water.

Q. At any time did the water have any odor to it?

A. Why, at times it did a little, yes. I don't know what it was from.

Q. What has been the effect, in your judgment, of the opening of the drainage canal, on the Illinois river?

A. Why, in my judgment, I think it has improved the water; the water looks better; you have got a better channel, and you have got a better water in every way, clearer water.

6200 Q. Any odor in the water now?

A. Not as I notice; that is not on the river. That is, what you call the river?

Q. The river, yes?

A. Yes.

Q. How does the size and current of the river now compare with what it was before the opening of the canal?

A. About double the current, as near as I can say; there was hardly any current before; almost dead water.

Q. What is the rapidity of the current now?

A. Well, sir, it must travel up above the bridges, six miles an hour or seven, something like that, I think; I would not say positively. I can tell the difference in it; I used to take a heavily loaded boat 27 miles down the river and back six or seven hundred pounds in it. I wouldn't want to do it now. That is the difference in the current.

Q. Have you noticed any odor in the water since the opening of the canal?

A. No, sir, not to my knowledge.

Q. Do you use the water on your boat for steam-making prposes?

A. No, sir; mine is a gasoline launch.

6201 CROSS-EXAMINATION, by Mr. Jeffries.

Q. Have you lived here in La Salle all your life?

A. Yes, sir.

Q. Have you ever been engaged in any other business?

A. Why, my occupation is tinner; I follow up the tinner's trade and the boat business at the same time.

Q. You say you are on the river two or three times a week?

A. Yes, sir.

Q. You have been on the river two or three times a week for how many years?

A. Oh, I should say thirty years.

Q. Are you right certain that there is no odor now on the water since the opening of the canal?

A. I have never noticed any, no, sir.

Q. Now, then, when you say there is no odor coming from the water in the Illinois river at the present time, or since the opening of the canal, you mean by that, from that part of the river that has a current, or flows, do you not?

A. Yes, sir.

Q. Is there any odor at any other point in the river?

A. As far as I have gone in it, no.

Q. In the bays and sloughs?

6202 A. Why, there is, I think, take this side here, the basin, there is an odor there all the time, but that comes from the sewers here, from the town, in my opinion.

Q. You say before the canal was opened you nad no current?

A. Hardly any current at all.

Q. Except in very high water?

A. In high water.

Q. How does the current now compare with what it was before the canal was opened?

A. Why it is a little over double it, or so. That is as near as I could get at it. I couldn't just exactly say just what it is.

Q. How does the volume of water in the Illinois river compare now with what it was before the canal was opened?

A. Why, I think the water stands about on an average of two feet or more—between two and three feet, higher than it used to.

Q. That is what makes the increased current, is it?

A. Of course, I suppose, it is the water, I suppose, we are getting from above.

Q. The people here in La Salle don't use the water in the Illinois river, do they, for drinking purposes?

A. Well, not to my knowledge.

Q. Don't you know that they do not?

6203 A. The city don't, I know; but may be people on the river may be using it for all of that; I don't know about it.

Q. How does the city get its water supply?

A. From pumping stations,—different wells.

Q. Have you a public—have the public water supplied to them?

A. Yes, sir.

Q. How deep are those wells?

A. That is something I couldn't tell you; I don't know.

(F. S. B., Com'r.)

6204 WALTER A. PANNECK, called as a witness in behalf of the defendants, being first duly sworn by the Commissioner, was examined in chief by Mr. Todd and testified as follows:

Q. What is your name?

A. Walter A. Panneck.

Q. What is your business?

A. I am an attorney.

Q. Do you hold any official posiaion here in La Salle?

A. Yes, sir.

Q. What is it?

A. Mayor.

Q. How long have you been mayor of La Salle?

A. Since 1903, the first of last May.

Q. As mayor of La Salle, what kind of sewerage system has the city of La Salle?

A. The city has got a complete sewer system which empties into the Illinois and Michigan canal.

Q. Where does the Illinois and Michigan canal empty?

A. The Illinois and Michigan canal empties into the Illinois river about 2,000 feet west of the western limits of the city of La Salle.

What is the population of La Salle?

6205 A. About 14,000.

Q. What separates La Salle from Peru?

A. There is nothing but an imaginary line.

Q. What is the population of Peru?

A. About—between eight and nine thousand.

Q. Are you acquainted with the sewerage system of Peru?

A. Yes.

Q. What kind of a sewerage system have they at Peru?

A. They have about the same as we have, except that their system empties into the Illinois river below the bluffs.

Q. Are all the houses in La Salle connected with the sewerage system?

A. No, sir; but I would judge about two-thirds.

Q. What becomes of the excreta from the population that does not enter into the Illinois river through the sewers?

A. It is hauled by the employes of the city to what is known as the bottom lands lying about a quarter of a mile south of La Salle.

Q. Has that land any connection with the Illinois river?

A. No, sir.

Q. In flood times does that land become overflowed?

A. Yes, sir.

Q. Does the excreta so deposited there get into the Illinois river at flood times?

6206 A. It would if it was there.

Q. What becomes of the offal from outhouses in times of flood upon the Illinois river?

A. Well, as to that I don't know.

Q. What proportion of the population of Peru is connected with the sewerage system?

A. I should judge abot one-half in Peru, probably not one-half.

Q. Is there a board of health connected with the city of La Salle?

A. Yes, sir.

Q. Who is the president of the board of health?

A. Dr. Fullenwider.

Q. Is he in town?

A. No, sir.

Q. Are you acquainted with the operations of the board of health of the city?

A. Well, to a certain extent, yes, sir.

Q. Do you know what the condition of the public health in the city has been during the last three years?

A. Yes, sir.

Q. What has it been?

A. It has been very good.

6207 Q. Do you know whether there is any typhoid fever in the town?

A. No, sir, not at the present time, or has not been since I went into office; there were a few cases last winter, but not very many.

Q. What kind of water supply have you in La Salle?

A. We have not a very good water supply at present.

Q. Where is the source from whence water is taken?

A. It comes from what is known as Smith's Springs, and Spring Dell Springs, and water from the Illinois and Michigan canal that is driven through gravel and sand to what is known as the intake, three and a quarter miles east of La Salle and from there it comes by natural gravity into the pumping station and is from there sent out to the city.

Q. The water that is taken from the Illinois and Michigan canal, can you describe in detail the processes through which that water goes before it is taken into the water pipes of the city?

A. Yes, sir; the water goes through about three-quarters of a mile of gravel and sand before it strikes the intake. It goes from the Illinois and Michigan canal through gravel to a small lake, and from there it is let into the intake, traveling pretty near all the way on the surface of the ground, and over and through this gravel and sand.

Q. Does the water as it leaves the canal travel over the
6208 gravel and sand?

A. Yes.

Q. And how does it get to the intake?

A. It travels over the gravel and sand to this small lake, and from the small lake it is piped into the intake.

Q. Well, does high water that comes from the Illinois river pass through the sand?

A. We get no water from the Illinois river.

Q. I mean the Illinois and Michigan canal?

A. It passes over gravel and sand and the natural conditions as they exist there. There are trees there and weeds and everything.

Q. Well, is it an open drain?

A. Yes, sir.

Q. Is it a kind of a filter?

A. It was originally started upon the theory that the sand and gravel would filter the Illinois and Michigan canal water. To what extent it is filtered I am unable to state for the reason that the water that is taken at the intake also comes from Smith's Springs and Spring Dell water, and between the three waters we have pretty good water in La Salle.

Q. What I want to get at is to know whether the connection between this lake and the Illinois and Michigan canal, is a kind of a small canal with a sand and gravel bottom to it, and
6209 the water coming from the canal just simply flows over the sand and gravel into the lake?

A. Yes, sir, you have got it correctly.

Q. It doesn't flow through it?

A. No, sir, it travels over it.

Q. And when it gets into this lake, it is then pumped?

A. It goes by gravity; there is a valve in the bottom of this lake and the water comes by natural gravity into the intake from this lake.

Q. The Illinois and Michigan canal is above the city datum?

A. Yes, sir; it is above the intake.

Q. And into this lake do the other waters come at the same time, from the springs?

A. No, not into the lake; the water from the springs goes direct to the intake.

Q. The water that is used in the city is made up of a mixture, then, of the spring waters and the water of the Illinois and Michigan canal?

A. Yes, sir.

Q. Now, is this water used for domestic purposes?

A. Yes, sir.

Q. Do the people drink that water?

A. Yes, sir.

Q. Do you know where the Illinois and Michigan canal is fed from?

6210 A. Well, I don't know as I know that,—where it is fed from. I always supposed it was fed from Lake Michigan, but I am not certain about it; I don't know.

Q. Well, it is fed above La Salle?

A. Yes, sir.

Q. And empties into the Illinois river down here about one thousand feet, as you stated?

A. About two thousand feet; somewhere in that neighborhood, west of the limits of La Salle.

Q. And from drinking that water, do you know whether there has been any typhoid fever in the city, under your administration?

A. There has not been a case of it since I went into office.

Q. Are you acquainted with the Illinois river before and since the opening of the drainage canal?

A. Yes, I have known the Illinois river for years.

Q. What was the condition of the Illinois river at La Salle before the opening of the drainage canal?

A. I lived along the banks of the Illinois river in Peru for about twelve years, and frequently went to the Illinois river when I lived in La Salle; from about the middle of August until probably the middle of September, during the dry seasons, the water was very low and stagnant, there was generally a green scum extending pretty near three-quarter of the way across the
6211 river during that period of time and there was practically
no flow; that is, no current in the river during that time. That was prior to the time that the drainage people sent the waters of Lake Michigan into the Illinois river.

Q. Was there any odor connected with the water before the opening of the canal?

A. Yes, the odor was very strong.

Q. In what way?

A. Well, it was nauseous; I don't know as I could term it any way than that it smelled bad; that is about the way I would put it.

Q. What is the condition of the Illinois river at this point since the opening of the drainage canal?

A. It has improved considerably. There is no nauseous smell emanating from the river, and there is considerable current to it now. It doesn't get as low as it frequently did, and the water is clearer.

Q. What is the width of the Illinois river at this point?

A. The width of the Illinois river right south of La Salle is about 300 feet; somewhere in that neighborhood.

Q. Does the river widen out as it goes down towards Peru?

A. It does in some places, yes, sir; it is wider southeast of La Salle than it is right south of La Salle.

6212 Q. What stretch of the river have you been acquainted with?

A. I have been acquainted with the river from what is known as Little Rock, down to what is now known as Marquette, for years.

Q. What is the distance between those two points?

A. The distance between those two points is about six miles.

Q. Is there a river that enters the Illinois river at this point that you know of?

A. Yes sir, the little Vermillion river.

Q. Where does it come from?

A. Why it comes from the north and runs south. I couldn't tell where it starts from. It runs quite a distance north.

Q. About how large a river is that when it empties into the Illinois?

A. That is a small river, probably 40 feet in width when it is high; it is a small channel of water.

Q. Is that above or below Peru?

A. The Little Vermillion is east of La Salle.

Q. That is above, is it?

A. It is above the Illinois River; it comes down hill.

Q. Is it above La Salle on the Illinois River where it enters?

A. No, it is south of La Salle; it empties into the Illinois river south of La Salle, a distance of about 700 feet, south of the right of way of the Rock Island track; it empties into
6213 the Illinois River and there it is about 20 feet in width
where it empties, and it varies from that width to forty or fifty feet up farther north.

CROSS-EXAMINATION,

By Mr. Jeffries.

Q. How long did you say you have lived in La Salle, Mr. Mayor?

A. I came to La Salle in 1873. In 1880 we moved to Peru, and I lived in Peru for ten years, and then since 1890 I have lived in La Salle.

Q. Describe again the three different sources from which La Salle gets its water supply?

A. It gets its water from the Spring Dell Springs, the Smith Springs and the water of the Illinois and Michigan canal.

Q. Now those Spring Dell Springs, what kind of a spring is that?

A. That is a surface spring, that comes down from between two hills about half a mile this side of the cement works.

Q. How far is Spring Dell spring from the Illinois River?

A. Spring Dell Springs are I should judge between one and two miles; probably a mile and a half north of the Illinois river, and about three and a quarter miles east of La Salle.

6214 Q. Do you know the volume of flow from that spring?

A. It is about 500,000 gallons per 24 hours.

Q. Do you know the character of the soil through which that water runs?

A. It is limestone gravel and a clay; I should call it clay; it is a sort of sub-soil of clayish—

Q. Do you know whether or not the water from this spring flows from towards the river before it comes out of the ground at the spring?

A. I don't know as I understand just what you mean. The water from the Spring Dell Springs flows south towards the river, from the north.

Q. That is what I want. Now Smiths' Springs, how far is that from the river?

A. The Smith springs are about half a mile from the river.

Q. With reference to the surface of the earth, how is it located?

A. Why there is a bed of gravel extending from about four miles east of La Salle to Peru, running to the surface at or about where the Smith Springs are located; it is about, between thirty and forty feet in width at La Salle and between 48 and 60 feet in Peru. The Smith Springs waters are almost upon the surface of the ground. The gravel bed from Smith
6215 Springs to Peru ranges from two feet to 35 feet in depth.

Q. Do you know the volume of water that comes from Smith's Springs?

A. That is probably in the neighborhood of three or four hundred thousand gallons of water per 24 hours.

Q. Does it flow from the river or towards the river?

A. As to that I am unable to state. We get the water right at the intake; we have a pipe from its source and I don't know which way it runs.

Q. Or where it comes from?

A. Or where it comes from.

Q. Except that it is your opinion that it comes from Lake Michigan, you say?

A. Oh, no; I didn't say that. I say—

Q. Didn't I understand you to say that in your direct examination?

A. No sir. I did say this; I understood that the supply of water for the Illinois and Michigan Canal came from Lake Michigan, as to that I was not certain.

Q. Now then how much water from the Illinois and Michigan Canal is being used?

A. At the present time we must be using, I would judge, about 500,000 gallons of water per 24 hours, out of the Illinois and Michigan canal. We are using considerable of that
6216 water at the present time.

Q. Now then, explain how that water is treated?

A. It comes out of the Illinois and Michigan Canal through a twelve-inch iron pipe, and it flows then upon the surface of the ground immediately south of the embankment, upon the south side of the canal. There it travels a distance of probably one-quarter of a mile through gravel, through weeds, shrubbery and such things until it comes to a small lake. The bed of the lake is sand, and below the level of the water is a valve, and a pipe connecting the lake with the intake, and whenever the valve is opened at the lake the water then is let in and comes down to the intake by gravity from this lake.

Q. Now how deep under the surface of the water is this valve that carries the water from the lake into the intake?

A. It must be about five or six feet.

Q. How deep is the water in the lake?

A. Probably must be in the same neighborhood. I never was in it, exactly, I couldn't tell you.

Q. What is the area of the lake?

A. Oh, it is not a large one, it is a smal lake.

Q. Well, about how many acres does it contain?

A. Oh, I don't know as it would cover a half an acre.

Q. About 1,400,000 gallons of water used per day from
6217 these three different sources?

A. Yes sir, we pump over that. That is approximately, I think we pump in the neighborhood of a million and a half gallons of water per 24 hours in this city.

Q. Are those water supplies and the water works owned by the city or by individuals?

A. They are owned by the city.

Q. Where does Peru get its water supply?

A. Peru gets its water supply from artesian wells.

Q. Exclusively?

A. Yes.

Q. The people living in La Salle and Peru, and what is this other little village above here?

A. Utica.

Q. No, Spring Valley—

A. Oh, that is west.

Q. Spring Valley and Utica—how do they get their water?

A. Spring Valley gets artesian water; so does Utica.

Q. From the intake where does the water go, direct into the mains?

A. Yes, it comes through 20 inch mains by natural gravity; it travels a distance of three and a quarter miles to the pumping station, there it empties into a large cistern and from that it is sent out throughout the city.

6218 Q. To the consumers?

A. Yes, direct pressure.

Q. How far is the valve which carries the water from the Illinois and Michigan canal into this bed of sand and gravel, from Chicago?

A. The valve that empties the water from the Illinois and Michigan Canal into our lake is a distance of probably about 97 miles from Chicago.

Q. From Lockport dam?

A. Why, if that is the channel; I am not familiar with the course of the canal beyond Lockport.

Q. Well, do you mean 94 miles to the corporate lmits or 94 miles from what particular point at Chicago?

A. We are one hundred miles from Chicago, and I would figure that about 97 miles. I couldn't tell you whether it is the limits or not; I don't know anything about that.

Q. The people at Peru, La Salle, Utica and Spring Valley do not use the water direct from the Illinois River, for domestic and drinking purposes?

A. No sir.

Q. What is the character of the sand and gravel through which this water runs or over which it runs from the valve which turns it out of the Illinois and Michigan Canal in its course toward the lake?

6219 A. The gravel is a coarse, clean gravel; the sand is a common sand that has been deposited there I guess for years.

Q. How deep is the gravel and sand, if you know?

A. The gravel or sand at that point runs probably from three to nine feet in depth.

Q. Now are there any means provided for spreading this water as it comes from the valve out over this sand and gravel?

A. No sir, we have never spent a dollar upon graveling or filtering that water.

Q. Does it naturally spread itself over the surface?

A. Yes sir, comes all over it, but it must travel a distance of three or four hundred feet around until it gets into this little lake. Some places it is two or three feet deep; I know I went into one of those holes and I have got it right.

Q. You say the current in the Illinois river at La Salle and Peru prior to the opening of the Chicago drainage canal was sluggish?

A. Yes sir, it was, from about the middle of July until the fall weather; until we received rains. Rains was the only method by which the current was increased in the river prior to the drainage.

Q. How is the current now at all seasons of the year?

A. The water is considerably deeper now. The river 6220 is deeper and there is considerable more current now than there was then; as to the exact difference, I couldn't tell you.

Q. I understood you to say that the water is clearer now than it was?

A. Yes sir.

Q. You have never chemically examined the water?

A. No sir, I am not a chemist. I know nothing about the—

Q. You know nothing about the deleterious substances that may be contained in the Illinois river water?

A. No sir, I do not; no sir.

Q. What is the condition of this water that comes into the lake through the valve, from the Illinois and Michigan Canal while it is in the canal at that point?

A. As to that I am unable to state.

Q. Did you ever notice it?

A. Yes sir.

Q. What are your observations of it?

A. It appeared muddy, dark.

Q. Well now, there has never been any criticism of the water that comes from these two springs, has there?

A. No sir, there has been no criticism. Well yes—strike that out. There has been criticism about the water generally, but not as to the water from these two springs. The water from the two springs is very good water.

6221 Q. How about the water from the Illinois and Michigan Canal?

A. Mixed with the three it is all right, but of itself, in my judgment it would not be the kind of water I would want to drink.

Q. Well, what is its reputation?

A. Well it is common ordinary canal water.

Q. What do the people in general say about it?

A. About the water?

Q. Yes, that particular water?

A. That it is unfit for domestic use, for domestic purposes.

Q. How far up and down the Illinois River are you acquainted?

A. From what is known as Little Rock to—well, I have been down that river a great many times; down to Marquette. I have been down that far.

Q. Are you on the river very much now?

A. No sir, I have not been for quite a while.

Q. Have you been on the river very much for the last four or five years?

A. No sir.

Q. So as to its exact condition at all times, you couldn't state positively?

A. No sir, not within the last four or five years. I have been on the river quite frequently and also noticed it and noticed it particularly after the waters of the Canal were emptied
6222 into the Illinois river.

Q. How large is this Little Vermillion?

A. You mean its width?

Q. Yes, what is the volume of water that is discharged into the Illinois river, if you know?

A. I don't know.

Q. It is a very small stream, is it not?

A. It is a small stream.

Q. At certain seasons of the year, it is large?

A. Yes.

Q. And at other seasons?

A. It is very small; it is just now small.

Q. But as a rule, taking it the year around, it is very small?

A. Yes, it is known as a small stream.

Q. Do you know and are you acquainted with the typhoid death statistics of La Salle and Peru and Utica?

A. No sir.

Q. For the last four years or five years?

A. No sir.

Q. There has been some typhoid fever, has there not?

A. Yes, there was in La Salle; I don't know anything about Peru, Utica or Spring Valley.

6223 Q. Do you know to what source it was attributed?

A. No sir.

Q. Never heard that discussed?

A. No sir, I never did. (F. S. B., Com'r.)

Whereupon an adjournment was taken until 1:00 P. M., same day at same place, La Salle, Illinois—Monday, August 17th, 1903.

6224 La Salle, Illinois, Harrison House. 1:00 P. M., Monday, August 17th, 1903. Continuation pursuant to adjournment. Present, the Commissioner and same counsel representing the respective parties.

CHARLES H. NICOLET,

called as a witness in behalf of the defendants, being first duly sworn by the Commissioner, was examined in chief by Judge Johns and testified as follows:

Q. State your name, residence and occupation?

A. Charles H. Nicolet; La Salle, civil engineer.

Q. How long have you lived in La Salle?

A. Since 1893.

Q. Have you had at any time any official position in the city of La Salle?

A. Yes sir.

Q. What was it?

A. City engineer.

Q. When was it and for how long a time?

A. Beginning with 1893, and for about four years.

Q. How far is La Salle from Joliet, by river?

6225 A. I don't know by river; sixty miles by rail.

Q. How far is it above Henry dam?

A. La Salle?

Q. Yes.

A. I couldn't say as to that.

Q. Well, about how far?

A. Well, I should think by river in the neighborhood of forty miles. That is a mere guess, however.

Q. What town immediately joins La Salle?

A. On the west, Peru.

Q. Now is there another town on the Illinois River named Spring Valley?

A. Yes sir.

Q. What is the population of Spring Valley in round numbers?

A. I should judge in the neighborhood of 4,000.

Q. And of Peru?

A. Probably 6,000.

Q. And of La Salle?

A. About 10,000.

Q. What is the source of the water supply in La Salle?

A. The water supply for La Salle is drawn from two different sources, three different sources I may say. In the first place, artesian wells; in the second place springs, and in the third place, seepage from the Illinois and Michigan canal.

6226 Q. Has La Salle a system of public waterworks?

A. Yes sir.

Q. Are these three sources of water received at the same intake?

A. Yes sir.

Q. How far is the water from the Illinois and Michigan Canal pumped until it reaches the intake?

A. In the neighborhood of 400 feet.

Q. Is it through an open ditch or is it through a natural layer of sand?

A. Through a gravel bed.

Q. Does it run on the surface a good deal of the way?

A. No sir, none of it.

Q. None of it?

A. No.

Q. You think it is seepage from the Illinois & Michigan Canal?

A. Yes, I think the so-called springs up there really have their source from the canal, and really they are seepage.

Q. Well but is there not a direct connection between the canal and a lake or pond into which these springs have their entrance?

A. About three or four years ago there was a connection
6227 with the lake, and these lakes had no connection with the
intake; whether they have been connected since I cannot
say; there is no connection I know of excepting the private—

Q. Now into what do the public sewers of La Salle empty?

A. Into the canal and the canal basin.

Q. And the canal basin into what?

A. Into the Illinois river.

Q. How far below La Salle?

A. About three-eights of a mile.

Q. What proportion of the population of La Salle has its domestic sewage emptied into the public sewers?

A. I should think about seventy per cent.

Q. What becomes of the household sewage of the remainder?

A. There is no scheme for disposing of the garbage, that is simply thrown on the surface as a rule.

Q. Is some of it hauled and deposited on some low land here near the Illinois river?

A. Oh, there is a little garbage thrown out there.

Q. Did you take samples of water for the State of Illinois in the years 1900 and 1901?

A. Yes sir. Well no, not in 1900 and 1901.

Q. In what years?

A. Well now, you will have to refer to the dates on those tickets (indicating).

6228 Q. Well, 1899 and 1900?

A. About that time. I don't remember as to dates; those are the correct dates, however (referring to tickets).

Q. Under whose employment or direction did you take the samples,—Professor Long's?

A. Yes, the chemist's.

Q. And to whom did you ship the samples?

A. To Prof. Long.

Q. How frequently did you take samples?

A. Once a week I believe, most of the time.

Q. Describe the method of taking them.

A. A bottle was sent to me—two bottles were sent to me in a case. One of them containing I should judge about two gallons, and the other one probably a pint. The bottles were always filled in the channel and were filled by removing the cap and the stopper under the water and they were replaced under the water.

Q. What kind of a cap was it, do you remember?

A. I have got that one bottle a little too large. I was thinking of the can. There wasn't over four ounces in that small bottle, I should say, and there was, as I recollect in the first place, a glass stopper; over the glass stopper was stretched a piece of rubber and that was bound on by a rubber band,

that is the small bottle. The large bottle I believe, had
6229 nothing but the—I don't remember whether there was
a cover over the glass stopper of the large bottle or not.

Q. When you had filled the smaller bottle, what did you do with it?

A. I replaced the stopper and put on the rubber arrangement, under the water, and removed it from the water and put it into a small can.

Q. With reference to packing it, did you use any ice?

A. Yes, it was then put in the wooden case that was provided for the two bottles, and packed in ice. Now I am not sure whether the large bottles were packed in ice, or just the small ones, I am not sure about that.

Q. The small ones.

A. I guess it was only the small ones.

Q. When the sample was taken, did you make out any ticket or card with reference to it?

A. There was a ticket.

Q. (Counsel hands paper to witness).

A. Well, you refer to this ticket?

Q. Yes?

A. Yes a ticket was made out, of which this is a copy, and that was put in an envelope and the bottles were tagged, stating the source—

6230 Q. Did you have a thermometer and take the temperature of the air and water?

A. Yes.

Q. Was that placed on the ticket each time?

A. Yes sir.

Q. I now hand you 36 tickets in an envelope and ask you to examine them and state whether or not they are tickets which were attached to bottles or samples of water which you took?

A. I suppose it is not necessary to identify each one o
them?

Q. Well, just look at each one of them.

(After examination by the witness).

A. Yes sir, these are the tickets that accompanied th
samples.

Q. Is the writing on those tickets in your hand?

A. In almost every instance they are. In two or three instances they are in my wife's hand.

Q. Were these tickets filled out by you or under your direction?

A. Yes sir.

Q. The tickets that were filled out by your wife were filled out at your request?

A. At my request, yes sir.

Q. How long from the time you took the samples until they were delivered to the express company?

6231 A. They were delivered to the express company the next morning in almost every instance. Once or twice they were delivered the same evening, if I recollect rightly now—let me see—yes, they were delivered the next morning, and went up, as I recollect it, on the ten o'clock morning train the next morning after the sample was taken.

Q. At what time of the day was the sample taken?

A. In the evening.

Q. In the samples taken in the Illinois river, where were they taken with reference to the sewage of the city of La Salle, above or below the city?

A. About some two or three miles above.

Q. Is there a stream comes into the Illinois river near there?

A. Yes sir.

Q. What is that?

A. There is two, the Little Vermillion and the big Vermillion, so-called.

Q. Now where is the Little Vermillion River?

A. The Little Vermillion lies to the east of La Salle.

Q. Is it above the city of La Salle, as the current of the Illinois River flows,—as to the current of the Illinois River?

A. Yes sir.

6232 Q. Where is the Big Vermillion?

A. It comes into the Illinois River about a mile above the mouth of the Little Vermillion.

Q. Did you take some samples of water in one of the Vermillion rivers?

A. Yes sir.

Q. In which one?

A. In the Big Vermillion.

JUDGE JOHNS: I now hand the Commissioner 36 tickets and ask to have them inclosed in an envelope and the envelope marked "State of Illinois Exhibit No. 13 for identification. Witness C. H. Nicolet."

Said tickets are so marked by the Commissioner.

Q. Examine the tickets I now hand you and state whether or not they are tickets representing the—or attached to samples of water taken in the Vermillion River?

A. They are.

Q. Is the writing upon those tickets in your hand?

A. Yes sir, I think in every instance—well, one or two are written in by my wife's hand.

Q. Such as are written by your wife's hand were under your direction?

A. Yes sir.

Q. Now are those the same tickets which, after being placed in an envelope, were attached to the bottles or samples of water taken in the Vermillion river? 6233

A. Yes sir.

Q. How far up the river from its mouth were these samples taken?

A. About one-quarter of a mile.

Q. Were these samples taken upon the dates and at the times stated in the tickets attached to them?

A. Yes sir.

MR. JOHNS: I now hand the Commissioner ten tickets, identified by the witness, and ask him to inclose them in an envelope and mark them "Exhibit 14 for the State of Illinois for identification. Witness C. H. Nicolet."

Q. Are you acquainted in any way here with the manufacture of zinc in La Salle?

A. Yes sir.

Q. How large a plant is there here, and how many plants for the manufacture of zinc?

A. Two plants.

Q. Well, what is in general numbers, their annual output?

A. I couldn't say as to their output as I am not familiar with that.

Q. What connection have you with the plant?

A. I am the engineer.

Q. The civil engineer?

6234 A. The civil engineer, yes sir.

Q. Do these zinc works use water of the Illinois River for any purpose?

A. No sir—well I can't speak for the Illinois Zinc Company. Our own company does not, the Matthiessen & Hegeler Zinc Company.

Q. From what source does the company which you represent obtain its water?

A. From the Little Vermillion.

Q. What is the name of the company for which you are the civil engineer?

A. Matthiessen & Hegeler Zinc Company.

Q. For what purpose does this company use the water of the Little Vermillion?

A. Well for a good many purposes; mainly for cooling bearings in journals.

Q. Do they use it for washing in any part of the ore or in any of the processes?

A. They use it incidentally for washing out tanks.

Q. Now is there some per cent of acid goes out of these tanks in the process of washing?

A. You can hardly say a per cent; there is a trace.

Q. Of what kind of acid?

A. Sulphuric acid.

Q. Into what is this washing, and the water used by the zinc works deposited finally, into the Vermillion river, or into the Illinois? 6235

A. Into the Vermillion river.

Q. And does it from thence pass into the Illinois?

A. Yes sir.

Q. Is that above or below La Salle?

A. Above La Salle.

Q. What amount of water do they use continuously from day to day?

A. Oh, I should judge perhaps a quarter of a million gallons a day.

Q. Pumped from the Little Vermillion River in, and then discharged again into the Little Vermillion?

A. Yes sir.

Q. What is the amount of water pumped here into the public water supply?

A. It varies from about 1,500,000 gallons to as much as 2,500,000 gallons per day,—24 hours.

Q. Daily—and after used that is discharged again into the Illinois River?

A. Most of it, presumably.

CROSS-EXAMINATION,

By Mr. Jeffries.

Q. How long have you lived in La Salle?

6236 A. Since 1893.

Q. How long have you been city engineer?

A. I was City Engineer from 1893 to 1897,—1896 or 1897 —I don't remember just when I left—about four years.

Q. You are not city engineer now?

A. No sir.

Q. At the time you were City Engineer, was this valve connecting the Illinois and Michigan Canal open so as to run the water into this sand bed which furnished a part of the water supply of the city?

A. It was opened at times when the supply was short.

Q. But as to whether it is open now or not you cannot say?

A. I couldn't say, no sir.

Q. The people generally in the city get their water supply from this public source, do they not?

A. Yes sir.

Q. They do not use the water of the Illinois River for domestic and drinking purposes?

A. They do not use it for domestic purposes, but it gets into the system when the water is high.

JUDGE JOHNS: Into the public supply system?

A. Yes sir.

Q. MR. JEFFRIES: In what way?

A. Overflows. The bottoms of the pipes are unsound,
6237 and the pressure is reversed and the water from the river gets into the pipes and it is drawn into the pumps and circulated.

Q. That is the only way that it can get in?

A. Yes sir.

Q. Well, do you know whether that condition obtains now?

A. It does not.

Q. How long has it been since it obtained?

A. Oh, I should judge some two or three months, possibly; perhaps six weeks, since the river has been down to normal stage.

Q. It does not prevail to any great extent though, does it?

A. It has this year prevailed for about four or five months, the past year.

Q. What particular part of the city is supplied with that water.

A. The entire city.

Q. The entire city?

A. Yes sir.

Q. What proportionate part of that water is Illinois River water during those times, if you know?

A. I couldn't tell anything about that.

Q. Very small percentage, is it not?

A. Well, enough to make the water very riley, and probably a pretty good per cent.

6238 Q. You say you don't use the water from the Illinois river in your zinc factory?

A. No sir.

Q. But you do use the water from the Vermillion?

A. Yes.

Q. And you discharge the surplus water or refuse into the Vermillion?

A. Yes sir.

Q. Now I understood you to say that there was a trace of acid in this water that was discharged from the factory?

A. At times probably; I have never tasted it.

Q. How much acid do you use in the manufacture of zinc in the zinc process?

A. We don't use any in the manufacture of zinc. We manufacture acid. These tanks that I referred to are the commercial tanks that are mounted on cars and shipped,—large tank cars. They are the means of transporting the acid. When they are returned they are washed out. There is no acid that remains in them of course. The acid is too valuable a product to remain in them; we simply wash them out, and the product is very small that is left in the tank.

Q. Do you know what per cent of acid is left in the water?

A. We can't classify the per cent; it would be some small fraction of one per cent.

Q. It would be an infinitesmal amount?

6239 A. It would be a very infinitesmal amount, just a trace.

Q. Now is there any other substance that your factory discharges into the Illinois River?

A. Nothing of a contaminating nature. There is very little sewage, but there is nothing else to contaminate the water. The water is used almost exclusively for circulating purposes and it is almost pure as it comes out.

Q. In what way does this water from the Illinois River, get into the water system here during high water?

A. The springs and artesian wells are about two miles above the city in the Illinois river bottom, and are conducted by gravity to the supply well at the pumps, which are erected at the mouth of the Little Vermillion, within the city limits. This well is supplied at the pumping station by a 24-inch vitrified pipe which is placed underground through the Illinois river bottoms. At places this pipe has been broken so that in time of ordinary requirements, the water is coming out of the pipe through these leaks and holes in the pipe; it oozes out on top of the ground. When there is an inordinate supply in the city, that is all stopped and of course these holes are open for the entrance of water. Now when the Illinois overflows at times of course it finds its way into the cracks and crevices into the pipes.

6240 Q. And it depends largely on the number of the crevices and cracks there are in the pipes?

A. Yes, and the state of the Illinois water.

Q. Now what protection does the city use towards preventing any more of those holes and crevices in the pipes?

A. Occasionally when a leak becomes very bad, it is fixed up. The city has made several efforts—the water system has been bonded for the limit allowed by law; they have not been able to, so that the people simply have to suffer.

Q. The water then that comes from the river is not recognized by the people as good water during those high stages?

A. Not potable water.

Q. And all means within the city's power at the present time and heretofore have been used to avoid anything of that kind?

A. Practically, yes.

Q. Improvements are now going on to better the condition.

A. No sir.

Q. Are you interested in any other manufacturing interest?

A. No sir.

Q. Except that of zinc?

A. No sir.

Q. Do you know anything about the discharge of substances from the other zinc factories in town?

A. Well, the other zinc factory is in Peru. This is the only one in La Salle.

6241 Q. I suppose they have about the same facilities that your company has?

A. Well, I presume so, although I couldn't say as to that.

Q. They follow practically the same method of management and treatment?

A. So far as I know.

(F. S. B., Com'r).

6242 JOHN GRUBB,

called as a witness in behalf of the defendants, being first duly sworn by the Commissioner, was examined in chief by Mr. Todd and testified as follows:

Q. What is your name?

A. John Grubb.

Q. What is your business?

A. Fishermen.

Q. How long have you been in the fishing business?

A. Oh, I have been in the fishing business—I commenced—for about the last, oh, seven years.

Q. Are you acquainted with the Illinois River?

A. Yes sir.

Q. What stretch of the river are you familiar with?

A. Why, between Spring Valley bridge there and the shipping port bridge here in La Salle.

Q. How far are those two points apart from each other?

A. Well, they are about seven miles I guess.

Q. What was the condition of the Illinois River before the opening of the drainage canal?

A. Why it kind of stagnated along the shores there and slimy stuff would be running along the shores there for a while and it would stink. People couldn't live along there;
6243 they would get malaria ague, and one thing and another that way and the fishing wouldn't be no good along the shore.

Q. What has been the effect of opening the drainage canal on the waters of the Illinois river?

A. Why, the only effect I see is fishing has been a little bit better and the fish will live longer in the water, and furthermore when I go over there in the spring or in the fall I generally take a drink of it. It don't hinder me any or hinder any of the rest of them; they drink it right along now when they are out seining.

Q. Have you heard of any fishermen who drank the water being made sick from it?

A. No sir.

Q. Prior to the opening of the canal how did fish live in the water?

A. Why, they lived pretty good. Before that when I would put little sunfish or croppie in boxes they would die in there, or black bass or anything like that, they would die, and now the water is fresh, and they will stay alive in it—there is more fresh water.

Q. How long, before the canal was opened, would they live?

A. They wouldn't live until the next day hardly.

Q. How about now?

6244 A. Why, they live for a week.

Q. How was the condition in winter?

A. In winter they live all winter.

Q. Before the opening of the canal how was it under the ice?

A. Why, the fish that we used to catch under the ice would taste tarry, gassy, you couldn't eat them; you could catch lots of fish all right, but they were no good; they were froze in the ice and one thing and another.

Q. Since the opening of the canal what has been the effect?

A. Why, the fish has been tasting pretty good. There is no fishing like they used to be then; they would come to a hole then, you know, where they won't now; they have got plenty of fresh water, more air holes; there is a more strong current in the river, I guess, keeps the air-holes open.

Q. Have you drank the water of the Illinois river?

A. Yes, sir.

Q. Since the opening of the canal?

A. Yes, sir.

Q. How frequently?

A. Oh, eight or ten times a day in the spring and in the fall.

Q. What effect has it had on you, if any?

A. Not any effect at all.

Q. Has it made you sick?

6245 A. No, sir; it made me feel like drinking more.

Q. What, in your opinion, has been the effect of the opening of the drainage canal on the waters of the Illinois river as to the question of whether the river is better or worse than before the opening of the canal?

A. Why, I think the river is better for my part, and for the rest of their parts; they are all catching lots of good fish up there, which they never catched before, that is, until this drainage canal was turned in.

Q. What fish are they catching?

A. Catfish, these lake perch, a few white fish and all kinds of game fish; there was more pickerel and black bass around this spring than there has been for a good many years.

Q. Are lake perch and white fish natives of the Illinois river?

A. They are in the Illinois river here now, yes.

Q. But were not here before the opening of the canal?

A. No, I never caught any.

CROSS-EXAMINATION, by Mr. Jeffries.

Q. How long have you lived in La Salle?

A. I have lived in La Salle for about 22 years.

Q. And fished all the time?

A. Most all the time, yes, either net fishing or trot-line fishing.

6246 Q. Did you fish before the opening of the canal?

A. Yes, sir.

Q. And fished since the canal was opened?

A. Yes, sir.

Q. And are fishing now?

A. Yes, sir.

Q. There is a larger volume of water now, isn't there and a better current?

A. Oh, there is a swifter current, yes, sir.

Q. How much swifter is it?

A. Oh, it is just that swift that you can't run a seine hardly. Of course it is probably three or four feet higher than it was before.

Q. What is the difference in the water now as to what it was before the canal was opened?

A. Why, the difference in the water now is it is clearer.

Q. You don't know whether it contains Chicago sewage or not, though, do you?

A. I don't know nothing about that. I know when it rains it is muddy, and that is all, but when it is settled, why, it is as clear as a crystal, especially in the fall, last year and the year before, why, it was as clear as a crystal.

Q. You say you drink the water of the Illinois river?

6247 A. Yes, sir.

Q. And it always makes you feel like you want more of it?

A. Oh, it just makes me feel that way, that I think it is all right.

Q. Got a kind of a salty taste, has it?

A. No, no.

Q. Do you drink anything else besides water?

A. I do when I get it.

Q. What kind of fish are those you say you caught since the opening of the canal, that you didn't catch before?

A. Lake perch.

Q. Did you ever fish in the lake?

A. In Chicago lake?

Q. Lake Michigan?

A. No, sir, but I have had perch shipped in here from Lake Michigan.

Q. Well, do you know whether they come from Lake Michigan or not?

A. Why, that is what they claimed; they come through the drainage; they never catched them around here before that size; I have catched two or three white fish.

Q. Well, what are the most prolific fish in the Illinois river?

6248 A. Carp.

Q. And the most numerous?

A. Why, that is the most fish that there is in there, the biggest majority of the fish is carp.

Q. What do the carp feed on?

A. On mud, I guess, and dough, such as that, and little seeds.

Q. Anything else?

A. Well, they live on some of the other spawn, I guess.

Q. Well, don't they feed on most anything?

A. They feed on most anything except a fish like a minnow, they won't eat that, or a piece of meat. They will eat worms; we generally fish with what we call dough-balls, little corn meal and flour mixed; it makes little balls, and we catch carp, and this river is just full of them.

(F. S. B. Com'r.)

6249 CHARLES RIMMELE, called as a witness in behalf of the defendants, being first duly sworn by the Commissioner, was examined in chief by Mr. Todd and testified as follows:

Q. What is your name?

A. Charles Rimmele.

Q. What is your business?

A. Boat business.

Q. Where?

A. In the lower basin here.

Q. How long have you been in the boat business?

A. Between ten and twelve years.

Q. Do you run a boat on the river?

A. A small launch.

Q. A pleasure craft?

A. Yes.

Q. How long have you been running that?

A. About between four and five years.

Q. You and your father run it together?

A. Yes, sir.

Q. Were you acquainted with the river before the opening of the drainage canal?

6250 A. Yes, sir.

Q. What was the condition of the river before the water of Lake Michigan was turned into it?

A. Well, it was a strong smell to it, full of moss; the water was low; you might as well say pretty near dead water.

Q. Since the opening of the canal what effect has the water of Lake Michigan had on the waters of the Illinois river?

A. It has been a great deal clearer.

Q. Any other changes?

A. There has been no moss.

Q. Anything else absent?

A. Well, we have had better fishing.

Q. Any smell to the waters?

A. No, sir.

Q. Have you drank the water of the Illinois river since the opening of the canal?

A. Well, not to amount to anything.

Q. How are the fish—do you know anything about the fish?

A. Well, there is more fish than we have had.

Q. How about the size of the river, is there a better depth?

A. Yes, sir.

Q. In what way?

A. In the depth and the width.

6251 Q. How wide is the river at the upper basin, as you call it?

A. Well, a block and a half, I guess, or two blocks, such as that.

Q. How deep is the water there?

A. Well, in places it is ten or twelve feet.

Q. How does the current now compare with what it has been before the opening of the canal?

A. Well, we have got a better current there, a good deal better current.

CROSS-EXAMINATION, by Mr. Jeffries.

Q. You say there is more fish than there were before the opening of the canal?

A. To my knowledge there is.

Q. Do you fish very much?

A. Yes, sir.

Q. The fish are no better than they were; there isn't any difference in that respect?

A. They are in the spring of the year.

Q. Do you fish for market?

A. No, sir.

Q. You don't drink the water when you can get anything else to drink, do you, out of the river?

6252 A. Very seldom, if I can get anything else to drink I don't touch it.

Q. Not even since the canal was opened?

A. Oh, I have drank it, but nothing to amount to anything.

Q. Well, you don't drink it unless—

A. Just in case of necessity, that's all.

Q. Now, did you drink it before the canal was opened?

A. Oh, I have drank it.

Q. Both before and since?

A. Yes, I have drank it.

Q. Why didn't you drink it all the time?

A. There was no use as long as I had good city water.

Q. So that you only drank it when it was absolutely necessary for you to drink it?

A. That's all.

(F. S. B., Com'r.)

6253 W. E. STAFFORD, called as a witness in behalf of the defendants, being first duly sworn by the Commissioner, was examined in chief by Mr. Todd and testified as follows:

Q. What is your name?

A. W. E. Stafford.

Q. Where do you live, Mr. Stafford?

A. La Salle.

Q. What is your business?

A. I am manager of the Postal Telegraph.

Q. How long have you lived in La Salle?

A. Seven years.

Q. Were you acquainted with the Illinois river before the opening of the drainage canal?

A. Yes, sir.

Q. And since?

A. Yes, sir.

Q. What opportunities had you of knowing the river before the opening of the canal?

A. I have always made it a point to be around the river more or less all the time.

Q. On the river now?

A. Yes, running a boat with Mr. Masserman and myself.

6254 Q. What boat?

A. The steamer Creve Coeur.

Q. Where does it run to and from?

A. Runs from here to Starved Rock; any place between Starved Rock and Peru.

Q. What was the condition of the river before the opening of the drainage canal?

A. Well, it doesn't seem to have the clear appearance that it has since; then it had more grass, gas and stuff of that kind.

Q. Any odor on the river?

A. Sometimes there is.

Q. How since?

A. We don't discover it so much since; the water has more of a blue cast now; it looks clearer a great deal.

Q. What effect in a general way has the opening of the canal had upon the water of the Illinois river at this point?

A. It has raised the water some.

Q. How about the current?

A. The color is clearer than it used to be.

Q. How about the current?

A. Well, I think it has increased the current some; we never had a great deal of current here.

6255 Q. Do you know anybody that drinks of the water of the Illinois river since the opening of the canal?

A. No, I don't—well, we have drank it on the boat.

Q. Since the opening of the canal?

A. Yes, this summer.

Q. How many do you know that drank it?

A. Mr. Masserman and myself is all I know of.

Q. Did it ever make you sick?

A. No, sir.

Q. Have you had typhoid fever?

A. No, sir.

Q. Do you know of any typhoid fever in this town?

A. I don't think at present; they have had it.

Q. How long ago?

A. Last fall. At the same time, the city water is not supposed to come from the river.

CROSS-EXAMINATION, by Mr. Jeffries.

Q. You say city water is not supposed to come from the river?

A. City water, no, sir.

Q. What does it come from?

A. It is supposed to come from springs.

Q. The water doesn't come from the Illinois and Michigan canal then?

6256 A. No, sir; it is not supposed to. I suppose it probably does when it overflows from there sometimes; it is supposed to come from Spring Dell.

Q. The people generally here don't use the water, do they, from the river?

A. No, sir.

Q. You don't know anything about the ingredients of the water, do you?

A. No, I don't; I never saw an analysis, although I understand it has been analyzed here.

Q. How often are you out on the river?

A. Well, we only generally run Sundays, once a week; sometimes we make one or two trips during the week.

Q. Has that continued during a series of years?

A. Yes, sir.

Q. Winter and summer?

A. Oh, no, in winter we don't, no.

RE-DIRECT EXAMINATION, by Mr. Todd.

Q. Do you know how much water comes from the Illinois and Michigan canal through that gravel channel, over to the lake?

MR. JEFFRIES: Objected to for the reason that the witness stated in his cross-examination that he didn't know 6257 where any other water came from, other than that which comes from the spring.

A. Which lake do you have reference to?

Q. What do you know I say, whether the water comes from the Illinois and Michigan canal to the waterworks—

A. Oh, to the waterworks?

Q. Yes?

A. Well, I suppose it does in high water, it overflows there.

Q. You have not investigated that?

A. I have been down there when the water was high, yes.

(F. S. B., Com'r.)

6258 F. L. MASTERMAN, called as a witness in behalf of the defendants, being first duly sworn by the Commissioner, was examined in chief by Mr. Todd and testified as follows:

Q. What is your name?

A. F. L. Masterman.

Q. What is your business?

A. Agent for the Adams Express Company.

Q. How long have you lived in La Salle?

A. Well, I have lived in La Salle off and on for thirty years, I guess.

Q. Are you acquainted with the Illinois river at this point?

A. Pretty well acquainted with it, yes, sir.

Q. What opportunities have you had of knowing the river?

A. Well, since I was a boy I have hunted a great deal up and down the river from Ottawa to Peoria, and been on the river a great deal ever since, running steamboats.

Q. What boat do you run?

A. The steamer Creve Coeur.

Q. You and Mr. Stafford run that boat together?

A. Yes, sir.

Q. What is the condition of the Illinois river today as compared with the condition of the Illinois river before the
6259 opening of the canal?

A. Well, it is from eighteen inches to twenty-four inches higher.

Q. How is the quality of the water compared with what it was before?

A. The quality of the water in the upper river where we do the most of our boating, is a great deal better; nice clear running water, where it used to be stagnant, and there was pools covered with green scum, without any current at all in it. You could walk across the river in places.

Q. Any odor to the water under those conditions?

A. Oh, yes, there was a natural swampy odor to it.

Q. Since the opening of the canal have you noticed any odor of that kind on the water?

A. No, there is no chance for odor on the water; there is probably in the upper river, from four to five miles of a current.

Q. Have you drank the water of the Illinois river since the opening of the canal?

A. I have, yes, sir.

Q. How often?

A. Well, I couldn't say. I remember of times, very often when we were out on the river and ran out of water, that we would take with us, we would drink the river water.

6260 Q. Who would you take with you on those trips?

A. Well, it would be impossible to say; we had so many with us.

Q. I mean was it an excursion boat?

A. It is an excursion boat, but I don't know that they drank the water; generally nobody but ourselves. I have drank it; I don't know of anybody else drinking it.

Q. Did you ever experience any deleterious effects from the use of the water?

A. Not at all.

CROSS-EXAMINATION, by Mr. Jeffries.

Q. How often have you drank it?

A. Why, that is impossible to say. I have drank it a good many times.

Q. You never drank it when you could get anything else, did you?

A. Oh, no; I never drink it when we have ice water aboard. It is not my intention to drink it. We intend to have water on the boat, but when we have not—

Q. The people around here don't use the water, do they, for drinking purposes?

A. No, they don't. It is not used for drinking purposes generally.

6261 Q. Nor domestic purposes?

A. No, sir.

Q. How long have you been running this boat?

A. Why, I have been running the Creve Coeur—this is the second season. (F. S. B., Com'r.)

6262 C. L. DIESTERWEG, called as a witness in behalf of the defendants, being first duly sworn by the Commissioner, was examined in chief by Judge Johns, and testified as follows:

Q. What is your name, residence and occupation?

A. C. L. Diesterweg.

Q. What is your occupation?

A. Shoe merchant.

Q. How long have you lived in La Salle?

A. About forty years.

Q. Are you acquainted with the waters of the Illinois river since you have lived here?

A. Why, I have as much acquaintance with it as any boy who was raised around here.

Q. Have you fished and hunted upon it?

A. Fished, hunted, swam in it, and so forth.

Q. Both before and since the opening of the drainage canal?

A. I have not swam in it since the opening of the canal.

Q. Have you fished some?

A. No, sir, not since.

Q. What was the condition of the Illinois river before the opening of the drainage canal, in 1900?

6263 A. Why, it was a very dirty, foul odored stream; the odor was very obnoxious during the low stage of water of course.

Q. How much, in your judgment, has the opening of the drainage canal increased the depth of the river here?

A. Why, about twelve to eighteen inches, I should judge.

Q. Now, since the opening of the drainage canal, what has been the condition of the water?

A. Why, I have never made an analysis of it, but from observation, it looks to be much purer and cleaner water; it is a good deal better colored.

Q. Is there a better current in the river?

A. A better current, yes, sir.

Q. How was the current before the opening of the canal?

A. At low stages it was very slow.

Q. Did a scum form on the water here before the opening of the canal?

A. Yes, very largely, a green scum.

Q. Was there plants in the water,—moss, something of that kind in the river?

Objected to as leading.

A. Yes, so much so, I have seen when riding in boats they would have to stop the propeller and take the grass off of it and moss.

6264 Q. Now, since the opening of the canal has there been any such thing?

A. I haven't noticed anything since.

CROSS-EXAMINATION, by Mr. Jeffries.

Q. How often have you been on the river since the opening of the canal?

A. Oh, that is pretty hard to tell; perhaps a dozen times, two dozen times, I couldn't tell you.

Q. In three years?

A. Yes, sir.

Q. How often were you on the river the three years prior to the opening of the canal?

A. About the same number of times.

Q. What you say with reference to the condition of the water is obtained altogether with reference to its appearance, is it not?

A. Yes, sir; altogether from its appearance.

Q. Do you know whether the water contains the sewage from Chicago or not at this time?

A. At this time?

Q. And since the opening of the canal?

A. Why, it is generally supposed that the drainage comes
6265 down here. I have stated that I did not make any chemical analysis.

Q. The people here don't use the water of the Illinois river for domestic and drinking purposes, do they.

A. No, they never have.

Q. That is, they don't use it if they know it?

A. Not if they know it. They never have used it. Some might seep into the wells during the extreme high water, but not very much.

RE-DIRECT EXAMINATION, by Mr. Todd.

Q. Is there anything in the appearance of the water that leads you to believe that Chicago sewage is in the water at this time?

A. No, sir. (F. S. B., Com'r.)

6266 DR. FLOYD CLENDENNEN, called as a witness in behalf of the defendants, being first duly sworn by the Commissioner, was examined in chief by Mr. Todd and testified as follows:

Q. What is your name?

A. Floyd Clendennen.

Q. What is your business?

A. Physician and surgeon.

Q. How long have you been practicing medicine in La Salle?

A. About thirty years.

Q. What is the condition of the public health in the city of La Salle since the opening of the drainage canal?

A. I think it has been improved.

Q. And is there any typhoid fever in the city?

A. Very little now; very little.

Q. What was the condition of the Illinois river before the opening of the drainage canal?

A. It was bad.

Q. How is the condition today as compared with what it was before?

A. Decidedly better, the water in the river is purer and decidedly better .

6267 Q. The drinking water that is used here in the waterworks is composed of what water?

A. It is composed of the water from the Illinois river, from the Illinois and Michigan canal and from some springs, and some artesian water. It is a mixture.

Q. And is that water drank by the people?

A. Largely.

Q. And is there any typhoid fever among the people who drink that water?

A. Very little; I am surprised at there not being more of it here, some of the water coming out of the canal, and swamps; I am surprised that there is not more than there is now.

Q. About how many cases of typhoid fever have there been in the town in the last year?

A. I can't say how many cases of typhoid fever in the last year; I had less typhoid to treat last year than I ever had before

CROSS-EXAMINATION, by Mr. Jeffries.

Q. How many physicians are there in La Salle?

A. I think there is about twelve or fourteen.

Q. How many in Peru?

A. About five, I think; I am not positive.

6268 Q. Do you know how much water is consumed in La Salle in a day?

A. No, I do not.

Q. Do you know how much comes from the two springs?

A. Well, I cannot say; there is many getting drinking water from other places, and from wells; they don't like to use that water, they are afraid of it.

Q. A good many of them boil the water too, don't they?

A. A good many of them boil the water, yes.

Q. Do you know what per cent of the water comes from the Illinois and Michigan Canal?

A. No, I do not.

Q. Nor what comes from the Illinois River?

A. No, I do not.

Q. Now do you know of your own knowledge that any of it comes from the *Illinois* river?

A. Yes, I do, from the fact that the pipes have broken places and in an overflow from the river a good deal gets in and it runs through the pump really down as low—

Q. The town of late has been using every precaution to improve those conditions, has it not?

A. No sir.

Q. And do all they could in that direction?

A. No, they have simply done nothing, as I look at it.
6269 They are digging a hole up here on the bottoms now for a supply of water; they are spending money when it is useless.

Q. Are you a member of the Board of Health?

A. I used to be, but I am not now.

Q. When was that?

A. I was health officer here for two or three terms, but not in the last six years, not since it has been—but I observe the water pretty closely. I am interested in it.

Q. This water that comes from the Illinois and Michigan Canal, percolates through sand and gravel does it not, before it comes into the intake?

A. I cannot say—yes, it passes through more or less broken rock, sand loam, and so forth, more or less earth. Yes sir, it passes through more or less—some of it is in the St. Peter sand stone which is broken up there.

Q. The high water that comes through the river is what comes through these breaks in the pipes?

A. The high water comes through the breaks in the pipes along the bottom, low down on the river, where it has overflowed a good deal.

Q. You say you are surprised that there is not more typhoid fever than there is?

A. Yes, from the water we are using.

6270 Q. The people generally understand that the water is not good?

A. They understand that the water is not good; they do.

Q. For that reason they take every precaution?

A. They take every precaution. I don't know as they take every precaution; some of them drink it, you know.

Q. The local board of health advises against it, and recommends boiling the water?

A. I don't think the Board of Health does anything; I don't think they are doing anything.

Q. Well the physicians generally do?

A. The physicians generally do advise against it I think. As far as the local board of health having any influence on the health of the city, it does not in my opinion, for they don't do anything but draw their salary.

Q. What school of medicine do you belong to, doctor?

A. I have studied three schools; I first studied the old school, then homeopathy and then graduated from the eclectic college in Chicago.

Q. How long ago has that been?

A. I think when I graduated the last time it was in 1874.

Q. When did you graduate in the old school?

A. I didn't graduate at all. Before I went in the army; I was in the army as an army surgeon before I graduated, and I have taken out a certificate in Michigan.

6271 Q. When did you graduate?

A. I didn't graduate in homeopathy at all; I studied it, but didn't graduate.

Q. So then you are a graduate of the eclectic?

A. Yes, graduated from the eclectic college, but the others I have certificates from the others, not legal graduation, not legal diplomas. Only a legal diploma in the eclectic, that's all.

Q. How long have you been practicing in La Salle?

A. I think since 1876—I was here before though; but I have been here constantly since 1876.

(F. S. B., Com'r.)

Whereupon an adjournment was taken until 4:00 P. M., same day, Monday, August 17th, 1903, at Ottawa, Illinois, at the Clifton House.

Ottawa, Illinois, Monday, August 17th, 1903.

6272 Continuation pursuant to adjournment.

Present, the Commissioner and same counsel representing the respective parties.

W. A. PIKE,

called as a witness in behalf of the defendants, being first duly sworn by the Commissioner, was examined in chief by Judge Johns and testified as follows:

Q. State your name, residence and occupation?

A. W. A. Pike; Ottawa, Illinois; physician.

Q. How long have you been practicing medicine in Ottawa?

A. Seven years.

Q. Of what school of medicine are you?

A. Rush Medical College, Chicago.

Q. Did you take samples of water for the State of Illinois in the Illinois and Fox rivers here?

A. Yes sir.

Q. During what two years?

A. I think it was 1899 and 1900.

Q. Who engaged you to do that?

6273 A. I think it was Dr. Long of Chicago.

Q. Did he give you instructions as to how the samples should be taken, or the manner of taking them?

A. Yes sir.

Q. You may describe the manner of taking the samples, commencing with the receipt of the bottles, the taking of the samples and sealing the bottles and delivering them to the express company?

A. Well, I would get the bottles from the express office, and take them over to the Illinois river and there we have a boat house and I was a member of the club there, so I used to take the boat and go out into mid-stream and take the collection. The large bottle holds a gallon or so, I have forgotten what it was now. I would take that and also the small bottle, and they were both packed in a box, and all tagged. The small one was packed in ice, and they were sealed—both bottles sealed, and were delivered to the express company.

Q. At what point in the river with reference to the city of Ottawa did you take the samples?

A. Well, most of them were taken above the Illinois river bridge or just about at the Illinois river bridge.

Q. Where would that be with reference to the sewage of Ottawa?

6274 A. Above.

Q. Where were the samples taken in the Fox River?

A. The first sample I took in the Fox river was in the stream itself, but at that time the water was so low that there was practically no flow at all in the river, except a little under-current. All the flow of the Fox River came down the feeder, and I wrote Prof. Long in regard to that and said that if he wanted a test of the water in the Fox river that the proper place to get it would be from the feeder, so that he gave me the instructions after that to take the samples from the Fox, from the feeder which comes from Dayton, four miles above.

Q. What do you mean by the term "feeder"?

A. Well it is a race; there is a dam at Dayton in the Fox, and there is no water comes over the dam in the summer time; the water in the Fox river comes down this race to Ottawa, which is the feeder for the Illinois and Michigan Canal.

Q. In other words the Fox River furnishes water here in the Illinois and Michigan Canal?

A. Yes sir, this division is furnished by the Fox River.

Q. How frequently did you take these samples?

A. Every week in the Illinois river and every two weeks I think, in the Fox in the first year.

Q. And the second year?

6275 A. Why, the second year I didn't take but two or three samples in the Fox if I remember rightly. He told me to abandon them. It was every week in the Illinois during the months of June, July and August, and there was only three collections made out of the Fox or out of the feeder, in that year,

Q. What year was that?

A. The second year, 1900.

Q. How far below the surface of the stream did you immerse the bottles?

A. Well it was far enough so that whatever was floating on the surface would not enter the bottle. I would reach down from the boat about as far as I could conveniently and would get the bottle below the surface.

Q. The small bottle—was it uncorked before you put it into the water?

A. If I remember rightly the small bottle, the instructions were—I have forgotten what it was now; it was either to fill it under water, or else we kept the cork in the hand, I have forgotten which it was. I know there was something particular about the small bottle. Yes sir, I remember that now. That was without removing the stopper from the bottle; it was to place it down below. I used to reach that down as far as I could.

Q. And after it was filled, was the stopper inserted under the water?

6276 A. Yes sir.

Q. Now when the bottles were filled, what did you next do with them?

A. Why, I brought them over to my office and I had a contract with a man here for some ice. I used to pack the small bottle in a can. They came in a can, and I used to pack ice around the small bottle and then seal the can, you know, and the large bottle.

Q. Did you at the same time that you took the samples, take a thermometer and take temperature?

A. Yes sir.

Q. Of what did you take the temperature?

A. Of the water in the river,—the Illinois River, and also of the Fox River.

Q. Did you also take the temperature of the air?

A. Yes sir.

Q. Now did you have tickets or cards?

A. Yes sir.

Q. Upon which you recorded the facts?

A. Yes sir.

Q. Did you prepare those tickets yourself?

A. Yes sir.

Q. After the tickets were prepared with the data upon them, what was done with them?

6277 A. They were placed in an envelope, addressed to—I don't remember. They were placed in an envelope of some kind, I have forgotten whether they were addressed to Dr. Long or not; I don't remember.

Q. Were they attached to the bottle in any way?

A. I think they were in the form of a shipping tag, that is an envelope with a perforation and tied a string to it, and that was sealed in with the seal on the bottle.

Q. Do you remember your number,—the number of your seal?

A. No, I do not.

Q. Were the seals of wax?

A. Yes sir.

Q. How were the bottles covered at the top, over the stoppers?

A. Why, the large bottle had a large cork and I think my instructions were to place the string as I tied it around the neck of the bottle, and tied the shipping tag across the cork and the seal was placed on that so that the string was included in the seal.

Q. Do you know whether the small bottle had a rubber cover for the stopper, which was fastened to it by a rubber band?

A. Why, it had a rubber band of some kind, but I have forgotten now, just what it was, to hold the stopper in
6278 place.

Q. How long a time after the sample was taken and put into the box until it arrived at the express office?

A. Oh, not more than fifteen minutes.

Q. At what time in the day did you take the samples?

A. Usually in the morning.

Q. I now hand you 35 tickets and ask you to examine them and tell whether or not those are the cards upon which you recorded the various data and whether those tickets are in your handwriting?

A. Yes, they are all in my handwriting.

Q. I call your attention especially to the tickets numbered 166, 218, 235, 256, 283, 388, 402, 418, 439, 442, 457, 472, 484, 577 and 595, and ask you to state whether or not those tickets represent samples of water taken in the Illinois river as distinguished from the Fox River, and if necessary, you may refresh your recollection from any memorandum which you made at the time, and which you now have in your possession?

A. Yes sir, those were taken from the Illinois.

Q. Were the samples taken in the Fox River taken in the same way?

A. Yes sir.

Q. And also in the feeder from the Fox River feeder?

A. Yes sir.

6279 JUDGE JOHNS: I now hand the Commissioner 35 tickets, and ask him to inclose them in an envelope and mark it for the State of Illinois Exhibit No. 15, for identification; witness W. A. Pike.

Received and so marked by the Commissioner.

Q. I now hand you eight tickets and ask you to examine the same and state whether or not they are the tickets which were attached to the samples of water taken either from the Fox River or the Fox River feeder?

A. Yes sir.

Q. Were those samples taken in the same way as you were instructed to take them by Dr. Long?

A. This is the one taken in the feeder, so that they were not taken from a boat; they were taken along the shore, but out into the stream. The stream was very swift.

Q. The feeder stream is very swift?

A. Yes sir.

JUDGE JOHNS: I now hand the commissioner the eight tickets and ask him to inclose them in an envelope, marked State of Illinois' Exhibit No. 16 for identification; witness W. A. Pike.

Received and so marked by the Commissioner.

Q. What kind of a river is the Fox Rixer, that is, is it a large or a small stream?

A. Small, very.

6280 Q. Where does it enter the Illinois river?

A. At Ottawa.

Q. Above or below the sewage of Ottawa?

A. Above the main part of the sewage.

Q. Does any part of the sewage of Ottawa empty into the Fox River?

A. Yes sir.

Q. Where were the samples in the Fox river taken with reference to the sewage of Ottawa?

A. Above.

Q. So that neither the samples of the Illinois River water, nor of the Fox River water were affected by the sewage of the city of Ottawa?

A. No sir.

Q. Does the Fox River in seasons of drought become dry or cease to have a regular flowing current?

A. Well, it is very low in the summer. There is always a current, but it is low.

Q. And small?

A. Yes sir.

Q. How long have you been acquainted with the water of the Illinois River?

A. Fifteen years.

Q. In what way?

6281 A. Well, as having been boating, fishing, and passing over the stream every day.

Q. What was the condition of the Illinois River at this point before January, 1900 when the drainage canal waters were turned in?

A. At any particular season of the year?

Q. A general description?

A. Well, it was a good stream, except in the summer time; it got pretty low, and then there was a great deal of scum and weeds and such things as that floating down the stream, or stagnant in the stream. In the fall, winter and spring, of course the stream was much higher and swifter current.

Q. In season of low water did it have an odor?

A. It did at times, yes.

Q. Do you know whether it had an odor here in the winter, when the river was frozen over under the ice?

A. Well, I couldn't say as to that.

Q. Now since the opening of the drainage canal, what has been the condition of the Illinois River here?

A. Well, the current has been greater, and the average depth has been greater. There has been less scum on the surface a great deal less, and the general condition of the river in my opinion, has been very much improved.

6282 Q. Has the city of Ottawa a public water supply?

A. Yes sir.

Q. From what source?

A. Artesian wells.

Q. Where are they and how deep are they?

A. They are located to the north of the city within the limits, and perhaps a quarter of a mile from the Fox River; but as to their depth, I don't know, except that they are very deep, I know that they are very deep.

Q. Does that source of supply furnish a good water here?

A. Yes sir.

Q. What is the population of Ottawa?

A. Between 10,000 and 11,000, nearly 11,000.

Q. Into what is the sewage of Ottawa emptied?

A. Into both the Fox and the Illinois rivers.

Q. What proportion of the inhabitants of the city of Ottawa in your judgment empty their household sewage into the sewers?

A. Well, at the present time I should judge nearly two-thirds.

Q. Do you know what is done with the household sewage of the other one-third?

A. Well that is mostly deposited in vaults; that is, water-closets.

Q. Are they cleaned?

6283 A. They are at times, not as much as they should be, though.

Q. When cleaned, what becomes of the matter taken out?

A. As a rule that has been buried. I think at the present time it is being dumped into the river. I was health officer for four years, up until this spring, and during that four years it was all buried.

Q. Then you were health officer before January, 1900?

A. Yes, in 1899 I was.

Q. What do you know with reference to typhoid fever in Ottawa prior to January, 1900?

A. Well, I couldn't say now, to be positive.

Q. Has the city a Board of Health?

A. Well, they have, but practically the health officer is the entire board.

Q. Have they a system here of reporting the deaths and the causes of death?

A. Yes sir.

Q. To whom?

A. Until last July they were reported to the health officer. Now under the state law they are reported to the city clerk and he issues the burial permits.

Q. Prior to the reporting of the death statistics to the city clerk was a record kept here of the causes of death?

A. Yes sir.

6284 Q. Could you obtain from that the number of deaths from typhoid fever from 1899 to 1903 or 1902?

A. Yes sir.

Q. Since the opening of the drainage canal what has been the condition here as to typhoid fever?

A. There has been very little with the exception of one year, which I think was 1901.

Q. Was there much at that time?

A. Well, I think we had about 20 or 25 cases here.

Q. While you were the health officer of the city, in cases of typhoid fever, what was done with the dejecta of the patients?

A. Well the physicians had their instructions as to what to do, which was to use a disinfectant, either a bi-chloride or something of their own selection, and if practical to put it into the sewage.

Q. Bichloride of what?

A. Mercury.

MR. JEFFRIES: I move to strike out the answer for the reason that the instructions to the physicians constitute no evidence that the disposition of the dejecta was carried out in the manner provided for, and required in the instructions.

Q. JUDGE JOHNS: Do you know whether those instructions were observed here by the physicians?

6285 A. I do not; none of this was carried out under my supervision.

Q. Had you cases of your own, which you attended?

A. I had but one case that summer.

Q. Do you understand that the dejecta of the typhoid patients here, whether disinfected or not, were cast into the sewers and thence into the Illinois river?

A. I couldn't swear as to that, I don't know.

Q. Were the instructions here to either bury them or burn the dejecta?

Objected to as leading.

A. Well, that was the instruction to physicians; that they were to be disinfected and destroyed as well as they could under the existing circumstances. There was no positive orders given or no explicit directions given.

Q. Was there an ordinance of the city council in reference to it?

A. No sir.

Q. Or a rule of the Board of Health?

A. Not regarding typhoid fever. They were not even required to be reported to the health officer, so that a great many of the cases I never knew anything about until I would hear them reported in the papers.

Q. When cases of typhoid fever were known, were they
6286 quarantined or isolated?

A. No sir.

Q. Were any means taken to disinfect the rooms or homes where they occurred?

A. Not officially, excepting as they would do it themselves under the direction of their own physician.

CROSS-EXAMINATION,

By Mr. Jeffries.

Q. Did you take any samples of water either from the Fox river or the Illinois river prior to the opening of the Chicago drainage canal?

A. Yes sir.

Q. Now what year was that?

A. In 1899 and 1900.

Q. What part of 1900 did you take samples before the canal was opened?

A. June, July and August.

Q. Well the canal was open at that time.

A. In 1900?

Q. Yes.

JUDGE JOHNS: It was opened in January, 1900.

A. Well it was in June, July and August, 1900 that I took the samples.

Q. MR. JEFFRIES: Then you took no samples in 1900
6287 before the opening of the drainage canal?

A. No sir.

Q. In other words you took no samples prior to January 17th, in 1900?

A. No, June, July and August the collections were made.

Q. In other words you took no samples from the first to the 17th day of January, 1900?

A. No sir.

Q. Now what month of the year did you take the samples of 1899?

A. July, August and September, October and November.

Q. And from what places?

A. From the Illinois and the Fox Rivers.

Q. With reference to the mouth of the Fox River, where were those samples taken?

A. They were all taken above the stream which comes from the Fox, although all of them were not taken geographically above the opening of the Fox.

Q. Now with reference to the Illinois and Michigan Canal, where were they taken in the Fox River?

A. They were taken above the opening of the feeder you mean into the—I only took one collection from the Fox River itself. The rest were all taken from the race or feeder which comes from Dayton; that was done before it emptied into the
6288 Illinois and Michigan Canal.

Q. That one sample?

A. No, those from the feeder were all taken before that.

Q. And there was one sample that was taken after it had passed through the Illinois and Michigan Canal?

A. No, the Fox river passes under the canal, and the canal is acqueducted over the river at this point. I took one from the Fox River itself. After that I was instructed to take them all from the feeder.

Q. And with reference to the Fox River, they were taken above the sewage discharges of this city, were they not?

A. Yes sir.

Q. Now did you take any samples from the Fox River in 1900?

A. Yes sir.

Q. During those months that you have just mentioned, June, July and August?

A. I took three in July and August,—one in July and two in August.

Q. Did you take any samples in 1901?

A. No sir.

Q. You took no samples at any time in 1901?

A. No sir.

Q. From either the Illinois or the Fox River?

A. No sir.

6289 Q. Now with reference to the mouth of the Fox River, where did you take the samples in the Illinois River, in 1899?

A. They were all taken above the stream of the Fox River.

Q. All of the samples that you took during the several periods were taken above the entrance of or the mouth of the Fox River?

A. Yes sir.

Q. And above the sewage discharges of the city of Ottawa?

A. Yes sir.

Q. Now did you have any instrument of any kind which you used to take these samples?

A. I had the bottles provided by the Commission.

Q. Aside from the receptacles, what instrument did you use?

A. Why the thermometers, when we would get the temperature of the air and the water.

Q. Well, did you have any machine of any kind that you put the bottle in and immersed the bottle under the surface of the water?

A. No sir.

Q. You used your hand?

A. Yes sir.

Q. And you went down under the surface about how deep?

A. Oh, three or four inches perhaps.

Q. Were you—or did you rinse the bottles out?

A. No sir.

6290 Q. What was the condition of these bottles at the time you received them?

A. They were cleaned and packed in a case.

Q. When did you remove the stopper or the cork—they were glass stoppers weren't they?

A. Yes. Of the large bottle I wasn't so very particular. I removed the stopper and put the bottle beneath the surface, and the small bottle, the stopper was removed under the surface of the water.

Q. Were your instructions upon that subject so that it required you not to be as careful with them as with the small ones?

A. Yes, as I understood it, the large one was simply for chemical analysis, and the small one was for bacteriological.

Q. And the small bottle, the corks were removed and replaced while the bottles were under the surface of the water?

A. Yes.

Q. Now that was not true always with reference to the large bottles?

A. No sir.

Q. Did you take all of these samples personally?

A. Yes sir.

Q. Every one?

A. Every one.

6291 Q. Did you use the thermometer that the parties had provided you with, or did you use your own?

A. Yes sir, I used one they furnished me with.

Q. Who furnished the thermometer?

A. Why I think Dr. Long sent it down.

Q. How far are the wells that are used to supply the inhabitants of Ottawa with water, from the Illinois River?

A. They must be three-quarters of a mile from the Illinois.

Q. How far from the Fox River?

A. And one-quarter of a mile from the Fox River.

Q. You say they were of some considerable depth?

A. Yes sir.

Q. Can you approximate it?

A. No, I can't.

Q. Do you know how many of them there are?

A. No, I don't know that; I know there are at least six.

Q. They are all stationed at one point, are they?

A. Yes sir.

Q. Do you know the character of the soil through which they are driven, whether it is clay, sand and gravel?

A. That is all gravel, I think, stratas of sand and gravel and a great deal of solid rock.

6292 Q. What percentage of the people of the city use the water from the public supply?

A. I should judge two-thirds, either all the time or part of the time.

Q. The city owns the water supply does it not, or the water plant?

A. Yes sir.

Q. Now in addition to these public wells, that are owned by the city, and the public waterworks, there are a large number of private wells, are there not?

A. Yes sir.

Q. Are they wells or cisterns, or both?

A. Artesian wells.

Q. Do the people living in this city and vicinity use the water of the Illinois River for drinking and domestic purposes?

A. No sir.

Q. It is one of the duties of the health officer is it not to keep close observation of the water supply?

A. Yes sir.

Q. To what extent is this town sewered?

A. Well, they have some sort of a sewerage sytem over about two-thirds of it.

Q. Where does that discharge?

A. In both the Illinois and Fox rivers.

6293 Q. Now you say the contents of the vaults are disposed of in what way?

A. They used to be buried; I don't know what disposition is made of them now.

Q. You have no personal information on that subject?

A. No.

Q. The comparison that you spoke of in your direct-examination since the opening of the canal and prior thereto, is based altogether upon your observation of the water, is it not?

A. Yes sir.

Q. You wouldn't recommend the water of the Illinois river for domestic and drinking purposes?

A. No sir.

Q. What school of medicine did you say you were of?

A. Rush Medical—regular.

Q. You have made no examination of the water or anything of that kind?

A. No sir.

Q. But your opinion as to it being suitable for drinking or domestic purposes is based upon your personal knowledge of the river and surroundings?

A. Yes sir.

(F. S. B., Com'r.)

6294 HENRY MAYO,

called as a witness in behalf of the defendants, being first duly sworn by the Commissioner, was examined in chief by Judge Johns and testified as follows:

Q. State your name, residence and occupation?

A. Henry Mayo; I reside here in the city of Ottawa, County of La Salle and State of Illinois, and have lived here since 1854.

Q. And your occupation?

A. Why, my occupation has been an attorney at law, and still continues to be an attorney at law; although I am Postmaster here at the present time.

Q. Were you ever concerned with the improvement of the Illinois River as a member of any association, and if so, of what association?

A. Yes sir, in 1887, the first bill was prepared and presented to the legislature authorizing the formation of a drainage district in the city of Chicago. At that time the Illinois River Valley—

MR. JEFFRIES: I object to the question because it is incompetent, irrelevant and immaterial.

A. (Continuing)—Association, which was an organization of people looking into the question of turning the sewage
6295 from the city of Chicago into the valley of the Illinois; took the matter in hand and organized and—I was placed at the head of the executive and judiciary committee for the Illinois Valley Association which extended at that time from Joliet to the mouth of the Illinois river. I continued in that position until after all of the amendments that are now attached to the law, which was passed in 1889, were prepared and adopted by the legislature.

MR. JEFFRIES: I move to strike out the answer and the question for the reason that it is not responsive to the question, and for the further reason that the object and purpose of the legislation which was secured through the efforts of this witness and his associates in the Commission upon which he may have been engaged, speak for themselves with reference to any interpretation thereupon by the witness.

Q. JUDGE JOHNS: Were you afterwards in any way concerned in the Commission appointed by the Governor under the drainage law, for the examination of the canal at the time of its completion?

A. Yes sir, I was associate counsel for the special commission appointed by the Governor, until the water was turned into the channel of the Desplaines river.

Q. How long have you been acquainted with the condition of the Illinois and Michigan Canal prior to the opening of the drainage district canal?

6296 A. Ever since I came here in 1854, down to the time of the opening of the drainage channel, and since, also.

Q. Now do you know of the fact as to the City of Chicago pumping water from the Chicago River into the Illinois and Michigan Canal in 1885?

A. Yes sir, I know about it, and I have been there,—not at that period of time, but I have been at Bridgeport during the time they were pumping. My recollection is that that work commenced very much earlier, probably at Bridgeport, than 1885. My recollection is that that commenced along in either 1871 or 1872,—the construction of the pumping works.

Q. What was the condition of the Illinois and Michigan Canal for five years prior to the 17th of January, 1900, when the drainage canal was opened?

A. Prior to the time it was opened?

Q. Yes?

A. Why, the canal, the upper level of the Illinois and Michigan Canal itself supplied the water from the pumping works at Bridgeport, and the pumping works at Bridgeport, the water lifted by the pumping works into the canal was very largely sewage itself from the south branch of the Chicago river; it was almost thick. I won't say it was thick, but it was very dark colored, and very much contaminated with sewage.

Q. Now what became of the water of the Illinois and
6297 Michigan Canal when it arrived at or near Joliet, with reference to its discharge into the Desplaines river?

A. The average amount of water lifted by the pumps at Bridgeport, I think was about 45,000 cubic feet per minute; sometimes more and sometimes perhaps a little less, but the average amount would be about 45,000 cubic feet of water per minute, about 12,000 cubic feet of water per minute of that amount was required for the purposes of navigation in the Illinois and Michigan Canal. The balance, the excess drawn out by the pumping works at Bridgeport was spilled into the Desplaines river where the canal came to the river, and came down through the Desplaines river from the upper basin of the canal and thence into the Illinois River.

Q. Now what was the condition of the Desplaines River at Joliet and down to the Illinois River while this matter was discharged into it?

A. It was very offensive. There was a very strong odor over the water from the dams at Joliet, very dark colored, and very thoroughly impregnated with sewage.

Q. Where did the Desplaines River enter the Illinois with reference to Joliet?

A. Just above Wilmington, and forms the Illinois by its junction with the Kankakee River.

Q. How far is Wilmington from Ottawa?

6298 A. I couldn't tell you the exact distance. I think it is fourteen miles below Joliet, or sixteen—fourteen I believe it is. I couldn't give you the exact distance.

Q. What was the condition of the Illinois river where it was formed by the junction of these two prior to the opening of the drainage canal?

A. Very much impregnated with the sewage that was taken out of the south branch of the Chicago river by the pumping works at Bridgeport,—so much so that the water had a very strong smell,—very offensive and in a bad, unhealthy condition, as I considered it.

Q. In the vicinity of Ottawa were there scums formed upon it, and was there a vegetable growth in the river?

Objected to as leading.

A. There was a vegetable growth on the water in warm weather, in the summer, a scum formed upon it, but to a greater or less extent, it depended upon the stage of water largely, but in an extreme low water there was a good deal of vegetable growth.

Q. Had it an odor?

A. It had a very strong odor, not so much in the summer as in the winter when the river was frozen over. I live on the south side of the Illinois river and cross it two or three times a day
and for that reason know what I am talking about. I have
6299 seen times when it disturbed my meals very much to cross
the river, before the water was turned in, when the ice was breaking around the piers, and the odor from the water came up from around those piers.

Q. At which time was the odor the most offensive, in the summer, in low water or in the winter when the ice was formed on the river?

A. Generally most offensive in the winter. It became so bad that fish couldn't live in the water at that time long. I don't recall the year, but I guess in 1879, we built a dam across here for water power purposes, above Ottawa, and that spring, a great many, probably wagon loads of fish were made stiff and virtually destroyed by the bad condition of the water.

Q. Now, since the opening of the drainage canal what has been the condition of the Desplaines River at Joliet and down to Wilmington, and the Illinois River from Wilmington to Ottawa?

A. In my judgment very much improved. The condition of the water, both winter and summer has been very much better than it ever was before. Its condition has improved instead of deteriorating, very much.

Q. Has it now an odor in the winter?

A. Nothing that I have perceived; there may be a very 6300 slight odor, but nothing that I have noticed; nothing to call my attention to it.

Q. As to the quality of the water, its appearance, what do you say as compared with the time prior to the opening of the canal?

A. It has very much improved in appearance as well. In low stage of water according to the statement of our city engineer, Robert Wilson, who is now dead—

MR. JEFFRIES: We object to any statement of the city engineer.

A. (Continuing) According to the best information that I could obtain, in a low stage of water, below the mouth of the Fox River, and at the Illinois bridge, which is just below the mouth of the Fox River, there were 150,000 cubic feet of water per minute passed the Illinois River bridge, and the water in extreme low stage was very offensive because a large part of it—I say a large part of it because not the larger part, but perhaps one part in six was sewage that came through the pumping works at Bridgeport. That condition has improved vastly since the opening of the drainage channel.

6301 CROSS-EXAMINATION, by Mr. Jeffries.

Q. When were you last on the Desplaines river?

A. I think it is probably—let's see—about four months.

Q. How often have you been upon that river in the last twenty years?

A. I was on that river very often during the time that I was associated with the Illinois Valley Association, as chairman of its committee, and very often during the time that I was acting as attorney for the special commission appointed by Governor Tanner, to pass upon and accept the channel on the part of the state, after turning the water in—very often.

Q. That was prior to the opening of the canal, was it not?

A. Yes sir.

Q. Since the opening of the canal your visits upon that river have been—

A. Not so often. I occasionally go to Joliet and then I have been to Lockport since that time, where the controlling works are.

Q. When you say the river has improved in condition you simply give that as your opinion from observation?

A. I certainly do, because I am not an expert; I have no
analyses of the water; I only know from general appear-
6302 ances, and from comparing the present condition with the
very offensive condition that sometimes occurred prior
to that time.

Q. What means are employed by the city of Ottawa for its water supply?

A. Artesian wells.

Q. They do not use the water from the river?

A. No sir, we have the waterworks here, but the waterworks are supplied by artesian wells.

Q. How deep are these wells?

A. I think 350 and one or two of them are probably deeper.

Q. Do you know how many wells of this kind they have?

A. In the city?

Q. That belong to the city?

A. No, I don't myself, the mayor can probably tell you better about that. There are probably in the neighborhood of sixty or seventy of those artesian wells here in the city.

Q. Yes, but I am speaking now of the wells used in connection with the city water supply?

A. I couldn't tell you myself, though there is an abundance of water I know.

Q. Do you know the character of the soil through which these wells are driven?

A. I think I do; that is I know by representations by
6303 men who have bored the wells.

Q. It is through sand and gravel, is it not?

A. No sir, it is through sand, the first strata is sand rock for about 100 feet, then you have 100 feet about, or 160 feet of limestone. It is very hard—before you strike the water-bearing rock.

Q. Do you know the character of that water bearing rock?

A. No, I don't anything different from other water-bearing rocks of the same nature.

Q. How far are those wells located from the Illinois River?

A. Oh, they are located a considerable distance, probably three-quarters of a mile, I should think, nearly three-quarters of a mile from the Illinois River—the wells that are used by the city. Other wells are close to the river.

Q. How far from the Fox River?

A. They cannot be probably over thirty or forty rods from the Fox River.

Q. Now in addition to the wells that are owned by the city in connection with its waterworks, you say there are a large number of private wells of the same sort?

A. Yes sir, a great many.

Q. About sixty in all?

A. I think probably more.

Q. Now in addition to these sixty or more, how many
6304 private cisterns or living wells are there, or are there any?

A. I don't know of any myself at present; there may be for all I know.

Q. The people living in Ottawa do not use the water from the Illinois River for drinking and domestic purposes, do they?

A. Not that I am aware of. If there are such cases I don't know it.

Q. What, Colonel, is the difference in the flow of the current of the Illinois River now as compared with what it was prior to the opening of the Chicago Drainage Canal?

A. It is a very little greater—there is by the amount of water now put in, and I take it that the drainage trustees are not complying with the law fully, but the river is raised about two feet or nearly two feet at this place, and the current is a little more rapid than it was before.

Q. Now you stated a moment ago that the odor that came from the water in the river prior to the opening of the canal was principally in the winter time?

A. Well not principally, but it was great at the time when the river was entirely frozen over, the breaking of the ice first occurred, around the piers in the bridges—the Illinois River bridge, which I crossed every day.

6305 Q. Now there is some odor since the opening of the canal at times, is there not?

A. At times there has been perhaps some—none observable from the bridge. I have heard some men say, which of course, I don't know, but I have heard some men say who have been on the river that there was at times some odor on the river.

Q. Are you on the river very often here?

A. Not on it only to cross it. I cross it two or three times a day.

Q. On the bridge?

A. Yes, I live on the south side of the river, and have lived there ever since I arrived in the city, and cross it regularly from two to four or five times a day.

Q. What did you say was the purpose of the organization of the Illinois River Valley Association?

A. The first purpose was to oppose the turning of water in from Chicago, that contained the sewage of Chicago—into the Illinois River. A thorough investigation of that question, coupled with the condition of the ship canal in so far as the sanitary district completed it, induced the people to change their ideas and to protect themselves against any noxious odors or any injury to health in so far as they were able to do so by getting such amendments to the law as we felt would protect our people through the valley.

6306 Q. Then the turning of the sewage was not the prime question, it was more the deep water proposition?

A. No sir, not to consider that, the waterway was one of the things. We induced the Illinois Valley people to consent to the cutting of the drainage channel though.

Q. And that was upon a general belief that deep water would be obtained, that the tacit consent of the Valley Association was obtained and their co-operation was secured?

A. I think quite largely so; there was a difference of opinion, some of our medical men claimed that we were going to be injured rather than benefited. Some took the opposite position.

Q. It was not, however, for the purpose of obtaining a pure water supply for any of the towns and cities situated upon the banks of the Illinois River?

A. Oh no sir, we never thought of that so far as I am concerned, and I don't know that any of our people here thought of it.

Q. So that so far as the association was concerned, deep water was really the principal and prime object?

A. That was the primary object and purpose with our people through the valley.

Q. And that association has much to do yet before they get deep water?

6307 A. I think so. I have been connected with it now for about fifteen or sixteen years, I guess, and I haven't seen the end yet.

(F. S. B., Com'r.)

6308 CHARLES E. HOOK,

called as a witness in behalf of the defendants, being first duly sworn by the Commissioner, was examined in chief by Mr. Todd and testified as follows:

Q. What is your name?

A. Charles E. Hook.

Q. What is your business?

A. Cashier of the First National Bank.

Q. Do you hold any official position in Ottawa?

A. Yes, I am mayor.

Q. How long have you been mayor?

A. About four months.

Q. Who was your predecessor?

A. Mr. Moloney.

Q. Are you acquainted with the Illinois River and if so, how long have you been?

A. Ever since I can remember.

Q. What opportunities have you had for becoming acquainted with the Illinois river?

A. Well, I have been on it more or less all my life, boating and swimming.

Q. What was the condition of the Illinois river prior to
6309 the opening of the drainage canal in January, 1900?

A. It was bad.

Q. By bad, what do you mean?

A. Well I mean it was in such condition that on evenings, you couldn't go out in a boat and stand it.

Q. Just describe all of its characteristics?

A. Well it was foul; it was a river with a scum or this green stuff that formed on the river—clover we used to call it.

Q. What is its condition now?

A. It is much cleaner.

Q. What effect, in your opinion, has the opening of the drainage canal had upon the Illinois River at this point?

A. It has produced more of a flow and the river appears to be much cleaner and freer from foul odors.

Q. What is the condition of the public health in Ottawa?

A. Good.

Q. Has Ottawa an open system of sewerage?

A. What do you mean by that?

Q. That is sewers connected with the houses?

A. It has not much of any system of sewerage.

Q. Where does the sewage of Ottawa find its outlet?

A. This portion of Ottawa here, empties into the Fox River; that south of the river empties into the Illinois.

6310 Q. What proportion of the population of Ottawa empties its sewage into the Fox River, and the Illinois River?

A. Well, I don't know; I should think that probably one-tenth of the territory emptied into the Fox River at present.

Q. What proportion into the Illinois?

A. I should say about one-fifth.

Q. What is the population of Ottawa?

A. About 11,000.

CROSS-EXAMINATION, by Mr. Jeffries.

Q. The people living in Ottawa do not drink the water from the Illinois River, do they?

A. No sir.

Q. Do you know of any one using the water from the Illinois river for drinking or domestic purposes?

A. No, sir.

Q. Now when you speak of the condition of the water being better since the opening of the canal than it was prior thereto, you do so in a qualified way, do you not?

A. Yes sir, I am not an expert on the analysis of water.

Q. Governed altogether by your personal observation?

A. Yes sir.

6311 Q. What you saw?

A. Yes sir.

Q. The sewage from Chicago may be in the water now as well as the filth and other decayed matter, prior to the opening of the canal, may it not?

A. It may be.

Q. How far is it from here to Chicago?

A. 84 miles.

Q. By river?

A. I don't know. That is by the Rock Island road.

Q. You don't travel on the river?

A. No.

Q. Are you a member of this Valley Association they talk so much about?

A. No sir.

Q. How long have you lived in this town?

A. Forty-one years.

RE-DIRECT EXAMINATION, by Mr. Todd.

Q. From observation, can you detect the presence of any Chicago sewage in the waters of the Illinois river at this point?

A. I don't think you can.

(F. S. B., Com'r.)

6312 M. T. MOLONEY,

called as a witness in behalf of the defendants, being first duly sworn by the Commissioner, was examined in chief by Mr. Todd and testified as follows:

Q. What is your name?

A. M. T. Moloney.

Q. What is your business?

A. I have practiced law for a living most of my life.

Q. Are you connected with any of the industries of Ottawa?

A. Why yes, I control and own the gas plant in this city; I own a hotel and own an office building and considerable other property.

Q. Have you ever filled any public position?

A. Yes sir, I have been living in this county for a little over 32 years, and I have been city attorney for a number of years; I have been states attorney of the county, as we call it, four years, and have been attorney-general of the state for four years, and been mayor here of the city of Ottawa for the last four years, up until about two or three months ago.

Q. Are you acquainted with the Illinois River?

A. Yes, I am familiar all during, practically, I might say all my life, as man and boy.

6313 Q. How extensive has been your acquaintance with the Illinois River?

A. Well, I don't know that I could exactly describe it, but I have known of it practically from its source where the Desplaines and Kankakee, by their junction, form the Illinois River; from that down, I might say, to Hennepin, where I used to practice law, when I was more actively engaged in the practice of law than I am at present. I have known all along the river. I used to for about seventeen years, have a camp down here in the summer, about six miles west of Ottawa, right on the bank of the river. I might say that I have lived on the bank of the Fox River for about seven years, and for the last seventeen years, I have lived on the bank of the Illinois River, on what we call the west side of this city.

Q. What was the condition of the Illinois River prior to the opening of the drainage canal in January, 1900?

A. During the part of the year, say from about the middle of June after our freshets, until the end of September, the water was low; it was foul, and filthy, and the scum, that greenish plant, whatever you call it, that would be found on stagnant pools, permeated all of it right along from one end of it practically to the other. There was little or no current during

that portion of the year. Of course, during the winter season
practically the same condition of affairs existed, except
6314 of course it was frozen over. I mean so far now as the
foulness and the stench arising from it was concerned. It
would not be ordinarly proper to call it an odor, because that is a more refined word—a stench, a smell would be the proper designation for it—the exhalations that arose from it.

Q. What has been the condition of the river since the opening of the drainage canal, at this point?

A. So far as I have been able to detect, and living as I have been during all those years on the bank of the river, there is a very, very vast improvement upon it; that is the God's truth—a vast, vast improvement. I didn't belong to the Illinois Valley Association, and I may say frankly here to you that I never took any stock in the loose talk that took place along this valley here. They had some meetings at Ottawa, some at Peoria, some at Marseilles. There were two men that got up this association and that was Means, a most excellent man of Peru, who is now dead, and Sanford Morris, who is also dead. Both were perfectly honest and perfectly sincere, and they thought it would be a detriment if the Chicago water diluted as the law directed, were to come down here; it would be detrimental to the health of the people of the valley. The fact is, I never took any stock in it and never belonged to it. I believed it would be a good thing for the city of Ottawa and for the
valley if we could get that Chicago sewage diluted as
6315 it was coming down to us, through that canal. Anyhow,
that was awfully offensive, terribly so. I believed it
would be a great advantage to the entire valley if the water was let in as contemplated by law. The only trouble is that you people have not complied with the law of this state. There was to be 300,000 cubic feet of water at the population that the Chicago district then was, when that act was passed, and it was to be increased proportionately at every 100,000. Now you are about 2,000,000 of people and it was then about 1,500,000. You are simply not letting down enough of water in my judgment. Certainly you don't comply with the law, and that is apparently because navigation of the south branch of the Chicago river would be somewhat impeded, as I understand it.

Q. You understand why the law has not been lived up to, do you not, General, the Secretary of War—

A. Yes, I understand about the Secretary, Mr. Alger, while he was Secretary of War, having issued an order to that effect with regard to the possible impairment of the navigation of the south branch of the Chicago River. I understand that General Alger did that.

Q. Since the opening of the canal, what in your opinion has been the effect upon the water at Ottawa?

A. Of course, without any scientific knowledge, personally, I can only say that from observation and living upon the bank of the river, that it has been freed from all of those
6316 noxious odors, stenches, and the accumulations of that
stuff on the surface of the water, which of course, would indicate a breeding of malaria ordinarily, if continued to exist. I think we are very much benefited, I would say by reason of the accumulation of water that has been coming down here, I think that is the concensus of the opinion of all our people throughout this entire valley.

MR. JEFFRIES: I move to strike out the part of the witness' statement giving the concensus of opinion of the people living in the Illinois River valley, on the subject testified to.

THE WITNESS: That certainly is my own opinion, and my own observation.

Q. MR. TODD: What was the condition of the Illinois and Michigan Canal prior to the opening of the drainage canal?

A. Well, very offensive, even though the level between Marseilles and the lower level down here, is practically filled by the feeder from the Fox River, up at Dayton, still it was offensive. That is what we call the feeder, which is about four miles northeast of here, and the water is taken from the Fox River and put into the Illinois and Michigan Canal.

CROSS-EXAMINATION, by Mr. Jeffries.

Q. How does the flow of the current in the Illinois river
6317 compare now to what it was before the opening of the
canal?

A. Why, there is a marked difference, I notice that daily you know, because I live on the bank of the river.

Q. And the current carries this decayed matter away?

A. Yes, I think so; I think there is no doubt about it. It prevents, you see—

Q. That of course prevents the odor from arising?

A. Well, of course I don't know just exactly whether it does or not; it certainly prevents now that decayed material, that scum that used to form during the summer and practically during—possibly of course not in winter, but certainly during the summer; it has carried that off without any question. We have a steamboat on the Illinois River plying between Ottawa and what we call Starved Rock, and no such thing has been known for the thirty-two years that I have lived here prior to that time, though I have heard that about fifty years ago, boats did come up from this end to Ottawa and to the mouth of the Fox River here and land over here where there is an old landmark, or used to be, about two years ago, where Daniel Webster spoke at one time.

Q. You wouldn't undertake to say that while there is no odor in the winter time, that the same impurities are not in the water?

6318 A. I can only say in answer to that, this, that it is not detected, and it was formerly, and what could any reasonable man conclude from that?

Q. Yes, but I am speaking with reference to a comparison of the conditions existing between winter and summer?

A. I would say precisely the same thing. My answer would be the same, we formerly detected it, and we don't now; now what do you conclude?

Q. Pardon me, General, but I think you don't comprehend the question. What I want to know is the fact that prior to the opening of the canal there was no stench or odor that was discernible in winter time, while there was in the summer time, yet that did not necessarily imply that the impurities were not in the water in the winter time?

A. If you will just divide that question up and make two questions instead of one, I would say in the first part, you are mistaken.

Q. I understood from your testimony a moment ago that the odor was discernible in the summer time?

A. Certainly.

Q. But was not so discernible in the winter time?

A. I didn't say that. It was discernible in the winter time just as well. My attention, when I was talking, was directed to the summer and not to the winter.

6319 Q. So that it was discernible prior to the opening of the canal at all times?

A. I think so, it was just as offensive in the winter, so far as we were concerned down there. The boys would go skating across the river and most always used to come down there. I lived fifty feet from the river—

Q. Now what you have stated in reference to the condition of the water now and prior to the opening of the canal is simply from your observation and not on account of any personal or scientific investigation that you have made, or that has been made?

A. You would have to divide that question. Personal and scientific—I ain't a scientist, but personally, I can't help this nose of mine being used to smell.

Q. That comes within your observation?

A. It comes through ordinarily the nerves of my nose, anyhow.

Q. How long have you been living on the bank of the river now?

A. Why, I should think nearly eighteen years, a little over seventeen—between seventeen and eighteen years, I think probably it will be either eighteen years next September, or either seventeen, and I am inclined to the notion that it will be eighteen.

6320 Q. Now in speaking of the Illinois Valley Association, at the time of its organization and down even to the present time, and especially down to the time of the opening of the canal, the membership almost entirely were working for a deep water way as you understood it, were they not?

A. Why of course—why I guess that to a certain extent, and they thought that the sewage of Chicago would be offensive to them as I understood it, but I always told them if they wanted water to come down here that the law directed, that I thought it was to be a God's blessing to the whole valley.

Q. Now the object of the people, as you believe, on that subject, did not have in view the obtaining of a water supply for the various towns and cities in the valley, but the object was to free themselves from this offensive odor that might have come from this water in the past, is that not true?

A. Except by their talks, I couldn't tell what those people intended. I hadn't any possible way of devining what their notions were. My own opinion was this, that there never was any intention on the part of those people, to use the additional supply of water for domestic purposes, or for any purpose except to have an additional water-way, and to have the sewage so diluted with an accumulation of water, as that it would not be offensive to us. From a patriotic standpoint I was always in favor of a large, deep canal, because I believed and 6321 I still believe, that we ought to have an internal waterway for at least men of war or cruisers on the interior streams of the country, of small draught to be at comparatively a moment's notice, thrown right into our lakes to defend our large cities and come right up from the Gulf, because while we are apparently friendly with England now, nobody can tell how long that may be, and I believe that we ought to have cruisers on the lakes to defend our large cities.

Q. That, however, could be obtained without carrying the Chicago sewage down the Illinois river?

A. I know, but you have got to have always some little motive and some little incentive to our people. I found that out in the war of 1898 when we had to go down to Porto Rico and Cuba, we were not prepared; we always want to do things right off in a hurry, and then we got left and we got walloped like blazes for about five or six months before we were in condition to fight.

(F. S. B., Com'r.)

6322 J. O. LESLIE,

called as a witness in behalf of the defendants, being first duly sworn by the Commissioner, was examined in chief by Judge Johns and testified as follows:

Q. State your name, residence and occupation?

A. My name is J. O. Leslie; my residence is Ottawa; occupation, school teacher.

Q. What position do you occupy with reference to the public schools of Ottawa?

A. I am principal of the High School.

Q. How long have you lived in Ottawa?

A. Fifteen years.

Q. Do you live anywhere near either the river Fox or the Illinois River?

A. Well, when the Illinois overflows, it overflows my garden.

Q. How long have you lived there?

A. I have lived there ten years, that is to say I lived on one side of the street or the other, across the street—ten years at that place.

Q. Do you sometimes fish?

A. Yes, sometimes.

6323 Q. Were you acquainted with the condition of the waters of the Illinois river before January, 1900, when the drainage canal was opened?

A. I was.

Q. What was its condition?

A. Well, the water was pretty bad sir, and I noticed it especially in the summer time.

Q. In what respect?

A. When the water would be low, in the summer, you could notice an accumulation of slimy mud, and then the water would go off of the places where it wasn't very deep and leave mud on the banks, a dirty, stinking mud.

Q. You mean when the high water would recede?

A. Yes sir.

Q. Was that a regular condition here after a flood and when the waters retired?

A. Yes sir, so far as I know, it was from the time I came here.

Q. Take it in your lot, for instance, did it leave a deposit there?

A. Well, that particular lot I have only owned three years, but I have lived immediately across the road for seven years before that, so that that special lot I don't know about it.

Q. But other places in that vicinity?

A. Yes sir.

6324 Q. What was the character of that odor?

A. Well, it is hard to characterize an odor—offensive I should say. I didn't like the smell of it.

Q. Now as to the condition of the river in low water, before the opening of the drainage canal, what was it?

A. Well, the current was very sluggish for one thing; the water was dirty and full of floating—I don't know what you would call it, chunks of stuff; it never was free from them. All along the banks of the river the gravel line just along the banks was most always covered with a dirty slime; never clear sand or clean gravel.

Q. Was there an odor to the water?

A. Always, so far as I know. I didn't use to like to row on it because it did smell so.

Q. Do you know of the condition of the water in the winter?

A. I don't know so much about that. I have sometimes skated a little, but never noticed it particularly.

Q. Now since the opening of the drainage canal what has been the condition of the Illinois River at this point?

A. Well sir, it has been very much improved—very much, I should say; the water stands twenty inches higher than it did at any rate, and the old muddy banks we used to notice are not exposed any more, and the gravel and sand along the edge of the river is cleaned up. You see the white sand now and the
6325 clean gravel that you never used to see before the ditch was turned in.

Q. Since the opening of the drainage canal and after a period of high water, was there any deposits left upon the banks here in the gardens on the low-lands?

A. Oh yes sir, but it is silt that is washed in from the surrounding country; it is not what comes down the river proper. It is what is washed in; it is such silt as is washed in by any flood.

Q. It is not offensive now, as it was?

A. No sir.

Q. How long have you been connected with the schools here?

A. Fifteen years.

Q. What has been the health of the children in the schools since the opening of the drainage canal as compared with that before?

MR. JEFFRIES: Object to the question for the reason that the evidence shows that the people living in this city do not use the waters of the Illinois River for domestic or drinking purposes.

A. I can't see a very great deal of difference, that I know of. The water, as this gentleman says, is not used for drinking purposes or for domestic purposes at all. We use artesian water here and it does not come from the Illinois river.

6326 CROSS-EXAMINATION, by Mr. Jeffries.

Q. When you speak of the condition of the water in the river being improved, you do so simply from what you have observed?

A. Sure.

Q. Not with reference to any use of it or anything of that character?

A. What do you mean by having used it?

Q. Using it for drinking or domestic purposes?

A. Sure; never used it that I know of; never intended to.

Q. What is the flow of the current now as compared to what it was before the canal was opened?

A. Well, it is just a matter of observation and judgment—I should say it was at least twice as great.

Q. At times before the canal was opened, there was practically no current?

A. Oh, there never was a time when there was no current, but it was often sluggish.

Q. It has never been sluggish though since?

A. I never saw it sluggish, no sir.

(F. S. B., Com'r.)

6327 JAMES F. FARRELL,

called as a witness in behalf of the defendants, being first duly sworn by the Commissioner, was examined in chief by Judge Johns and testified as follows:

Q. State your name, residence and occupation?

A. James F. Farrell; I reside at Ottawa, Illinois; I am a newspaper man and also city clerk.

Q. How long have you been city clerk?

A. I have been for the past four months, but I was city clerk on a former occasion; ten years ago, I was also city clerk.

Q. Is there in the office of the city clerk a record of the deaths from all causes?

A. Yes sir.

Q. For how long a time has that been kept?

A. For a period of thirty years, I think, about 35 years.

Q. Are you the custodian of that record?

A. Yes.

Q. Have you that record with you?

A. Yes sir.

Q. I wish you would open it and give from it the number of deaths from typhoid fever from 1897 until the present year?

6328 A. Fourteen deaths from typhoid fever.

Q. How many each year?

A. 1897, 5 deaths,
1898, None,
1899, 2 deaths,
1900, 2 deaths,
1901, 4 deaths,
1902, 1 death.

Q. And have you a record thus far in 1903?

A. Yes, there were none I believe in the last year, in 1903; nothing in 1903 at all.

CROSS-EXAMINATION, by Mr. Jeffries.

Q. Do you keep this book?

A. Yes sir.

Q. How long have you kept it?

A. Well this last time, I have kept it since the first of May.

Q. Have you kept it at any other time for the last six years?

A. No sir.

Q. Is there any distinction made between typhoid malaria, typhoid fever and malarial typhoid or typhoid malaria?

A. Well, I think not.

6329 Q. It all goes under the one head?

A. It all comes under the head of typhoid. Most doctors, in rendering their certificates, present them in that form.

Q. Just simply typhoid?

A. Typhoid, yes, and very frequently, if you will observe there you will find that in cases where deaths have been caused by pneumonia, it may have been typhoid pneumonia; I know nothing about that.

Q. And have you included those in your list?

A. I have not.

(F. S. B., Com'r.)

Whereupon an adjournment was taken to same place until 7:30 p. m., same day, Monday, August 17, 1903.

6330 Ottawa, Illinois, Monday, August 17, 1903.

Parties met pursuant to Adjournment. 7:30 p. m. Present, the Commissioner and same counsel representing the respective parties.

LESTER J. HORAN,

called as a witness in behalf of the defendants, being first duly sworn by the Commissioner, was examined in chief by Mr. Todd and testified as follows:

Q. What is your name?

A. Lester J. Horan.

Q. Where do you live?

A. 311 East Superior Street, Ottawa, Illinois.

Q. Mr. Horan, did you take water for the Sanitary District of Chicago?

A. I did.

Q. When did you take it?

A. I kept no record of it; my cards are the only record.

Q. About what time was it?

A. Well, through the summer months up to along, October, I believe.

6331 Q. October of what year?

A. 1900.

Q. For whom did you take the water?

A. I understood it was for the Sanitary District of Chicago.

Q. At what places did you take the water?

A. From the Fox river north of Ottawa, and from the Illinois east of Ottawa.

Q. What did you take the water in?

A. Glass bottles, a gallon and a four ounce bottle, one of each of these from each river.

Q. Where did you get the bottles from?

A. They were shipped from the station to where the water was delivered.

Q. Where were they shipped from?

A. From the Department of Health and from the Illinois University at Champaign.

Q. When you got the bottles did they have a cork in them?

A. Yes sir.

Q. What kind of a cork?

A. Glass stopper.

Q. After you received the bottles, just relate the manner in which you filled them?

A. I placed the bottles elbow deep under the water, removed the stopper, let in a small quantity of water, placed the stopper in again; withdrew the bottles, rinsed them, emptied out the water and placed the stopper in again, placed the bottle again in the water and removed the stopper until they were filled within—well just left small air spaces in the top. 6332

Q. Now after you filled the bottle, what did you do with the bottle?

A. I sealed them.

Q. How did you seal them?

A. By placing a rubber cloth over it, and running a wire seal around it with the number, one was from one river and the other from the other.

Q. After you had sealed them what did you do with them?

A. I took them over to the house and packed them before shipping.

Q. How long after you took them out of the water before you packed them and prepared them for shipment?

A. Well, about twenty minutes I should judge.

Q. How did you pack them?

A. The large bottles were put in excelsior in the case; the small bottles placed in a small can and then in turn put in ice, in a larger can.

Q. After you had got them prepared in that manner, how did you identify them?

6333 A. There was an envelope containing a tag with the date of taking the water attached to the large bottle.

Q. Did that tag have the sample number on it?

A. Yes sir.

Q. The date?

A. Yes sir.

Q. Place taken?

A. Yes sir.

Q. Your name as collector?

A. Yes sir.

Q. Height of water?

A. Yes sir.

Q. Temperature of water?

A. Yes sir.

Q. Direction of wind?

A. Yes sir.

Q. And temperature of air?

A. Yes sir.

Q. With the directions on the back?

A. Yes sir, the directions for filling the bottle and filling out the card.

Q. I show you Sanitary District of Chicago Exhibit No. 11, for identification, Frank S. Bright, Commissioner, and ask 6334 you if the cards which you filled out were cards similar to the one that you have, as far as the printing matter was concerned?

A. Yes sir.

Q. With the directions on the back the same as that?

A. Yes sir.

Q. That card you attached to each sample that you sent?

A. That is the sample consisting of the large and the small bottle.

Q. The large and small bottle?

A. Yes sir.

Q. Now to whom did you send these samples?

A. To the University of Illinois.

Q. Anywhere else?

A. Well no, not in my name.

Q. Did you send any in any other name?

A. No sir.

Q. Do you know whether you sent any to Chicago or not?

A. I don't believe I did.

Q. How long after the samples were taken before they were put on the train?

A. Well, the samples—an hour and a half at the most.

Q. When you got bottles from Chicago, where did you send the bottles that you got from Chicago?

6335 A. The bottles were returned to Chicago.

Q. To whom did you send them?

A. To the Department of Health.

Q. You sent some to the Department of Health?

A. No, just returned bottles there.

Q. The bottles you sent were sent to Professor Palmer of the University of Illinois?

A. Yes sir.

Q. Didn't you send any to the Board of Health of Chicago and to Professor Jordan of the University of Chicago?

A. I don't remember. I had his tags but I don't remember of positively sending any.

Q. Well if you did send any to the University of Chicago, and the Board of Health of Chicago, they would have the tags, with your name?

A. Yes, have my name and the date on it.

Q. The same as these other samples?

A. Yes sir.

Q. And those tags would correctly state the facts as you wrote on the tags?

A. Yes sir.

6336

CROSS-EXAMINATION,

By Mr. Jeffries.

Q. You say this was in 1900 or 1901?

A. In 1900.

Q. What part of the year?

A. Along in the summer, up until October.

Q. How often did you take samples of water?

A. Once a week.

Q. From what particular place in the river?

A. North of Ottawa and East of Ottawa.

Q. How far north?

A. Above where any sewage emptied into the river and east of the same line.

Q. Well, about how many miles?

A. Well, half a mile I think, about.

Q. How far east?

A. East it was across from the Pioneer Works clay bed.

Q. Now did you take samples at both of these places each time?

A. Yes sir.

Q. When you took the sample above the town, did you pack that and ship it before you took the sample below?

A. No sir.

6337 Q. Then you collected the sample at both places, packed them, sealed them and tagged them and shipped them within an hour and a half from the time the first sample was taken?

A. That is about the time.

Q. Who assisted you in this work?

A. Nobody.

Q. Did you use an instrument or machine of any kind in which you placed the bottle before you submerged it into the water?

A. No sir.

Q. You used your hand for that purpose, did you?

A. Yes sir.

Q. Now when did you remove the stopper from the bottle?

A. After the bottle was of the length of my elbow under the water.

Q. Now that was with reference to both the small and the large bottle?

A. Yes sir.

Q. Did you rinse the bottles out?

A. Yes sir.

Q. After you had immersed the bottles in the water and drew them out and rinsed them, did you put the stopper in again before you immersed it in the water?

A. After I rinsed the bottle I put the stopper in and put
6338 the bottles down under the water, took the stopper out
and filled the bottle and then placed it in again before
I took it out of the water.

Q. Both the large and small bottle?

A. Yes sir.

Q. Now were the small bottles packed in ice upon every occasion?

A. Yes sir.

Q. Did you do that yourself?

A. Yes sir.

Q. No one did it for you at any time?

A. No sir.

Q. Now did you take samples at any other period than that which you have just mentioned?

A. No sir.

Q. You spoke of shipping bottles to Chicago that were empty bottles, how did that happen?

A. They sent an order and the order was countermanded.

Q. All of the orders then that came from Chicago were countermanded?

A. All of them?

Q. Yes?

A. I understood all of them came from Chicago.

6339 Q. Well all the orders that came to you from Chicago—

A. Well as far as I had to do with them, they were.

Q. And the only order that you shipped was from here to the University?

A. I had tags from the Chicago University and from the Department of Health, Chicago, but I don't remember positively of shipping them there.

Q. What express company did you send them by?

A. United States Express Company.

Q. How many times did you miss the train on the day that you took the samples?

A. I don't ever remember of missing it.

Q. You may have?

A. Not that I was aware of.

Q. How is that?

A. Not that I was aware of.

Q. After they sent the bottles down here to be filled and shipped to Chicago and countermanded the order, did they write you to that effect?

A. They wrote a letter saying, return the bottles and tags to the Department of Health of Chicago.

Q. And you did so?

A. Yes sir.

Q. There was no excuse given as to why they had countermanded the order?

6340 A. Not that I remember of.

MR. JEFFRIES: That's all.

MR. TODD: That's all.

(F. S. B., Com'r.)

6341 ALBERT HAHN,

called as a witness in behalf of the defendants, being first duly sworn by the Commissioner, was examined in chief by Mr. Todd and testified as follows

Q. What is your name?

A. Albert Hahn.

Q. Where do you live?

A. 300 Jackson Street, Ottawa, Illinois.

Q. Did you ever take samples of water?

A. Yes.

Q. For the University of Illinois?

A. Yes sir.

Q. About what years did you take them?

A. 1898.

Q. Do you know whether you took any in 1899?

A. No sir.

Q. For whom did you take them?

A. Professor Palmer of the University of Illinois.

Q. Where did you take the water from?

A. Fox River.

Q. What point?

A. East of Ottawa.

6342 Q. How far above where the sewage of Ottawa enters the Fox River?

A. Well, it was between the Fox River Bridge here and the aqueduct.

Q. How often did you take the samples?

A. Once a week.

Q. Now just describe how you took the samples and what you did with them?

A. Well, the bottle was tied with a linen cloth or stopper, a linen cloth, when it came. You didn't open it until you got to the river and would go out about, well as far out as you could get into the river, where the current was, and put the bottle down at arm's length; remove the stopper and fill it about half full; place the stopper on again, and rinse the bottle; and then put the stopper in before you put it into the water, then withdrew it after you had it in there, filled the bottle, placed the stopper in while it was still in the water, then withdrew it, and tied that cloth around it.

Q. Then what did you do with it?

A. Packed it in excelsior and shipped it.

Q. Did you put any tag on it?

A. Yes sir.

Q. What kind of a tag did you put on it?

A. Well, I don't remember; it was a card of instructions 6343 that came in an envelope, a card of instructions with every bottle, and it was tied right onto the bottle.

Q. What did you put on the tag?

A. Date, the condition of the river, whether above or below normal, the weather, and signed my name.

Q. Did you see Professor Palmer at any time?

A. Yes sir.

Q. He gave you instructions?

A. Not at the time. I met the gentleman while I was taking water, but all I got was the written instructions from him.

Q. Now, after you got the sample packed, what did you do with it?

A. Took it to the express company's office.

Q. And whom did you express it to?

A. Professor Palmer, of the University of Illinois.

Q. You didn't pack any samples in ice?

A. No sir.

Q. How long after, from the time you took the samples out of the river was it before you put it in the express company's charge?

A. Not later than half an hour.

6344 CROSS-EXAMINATION,

By Mr. Jeffries.

Q. How often did you take samples?

A. Once a week.

Q. For how many weeks?

A. I don't know.

Q. Have you any idea?

A. I began March, 1898, and the last I can remember is December the same year.

Q. Did you take any in 1899?

A. Not that I remember of.

Q. In 1900?

A. No sir, I know I didn't in 1900.

Q. Are you certain that you did not or that you did take them in 1899?

A. I am not certain that I did not take them.

Q. What is your impression or opinion?

A. Well, I have forgotten; it is so long ago.

Q. How can you remember that you did take them in 1898, and cannot remember as to whether you did in 1899?

A. Well I had a record of them when I took them.

Q. And you quit keeping the record?

A. Yes sir.

Q. Did you take any in the winter of 1898?

6345 A. Yes, began in March.

Q. Did you continue through the spring, summer, fall and winter?

A. Yes sir.

Q. And go into the following spring?

A. I don't remember.

Q. Were you out in a skiff to take these samples?

A. No sir.

Q. Get them on the edge of the water?

A. No sir, I waded out as far as I could. In cold weather when there was ice in the river I chopped a hole in the ice; went out as far as I could then into the river.

Q. You didn't get the sample from the channel of the river then?

A. Yes sir.

Q. All the time?

A. Yes sir.

Q. How deep was the water where you got the samples?

A. Oh, it varied from a foot in the summer time to probably four or five feet deep at the deepest.

Q. That was before the Chicago drainage canal was opened?

A. I don't remember when that was opened.

Q. Well, do you remember whether it was opened at that time or not?

6346 A. No sir, I didn't pay any attention.

Q. How long after you took these samples before you shipped them?

A. I took them to the express office, I don't know what became of them after that.

Q. Did you take a receipt for them?

A. No sir.

Q. Did you take samples at any other place than this one that you speak of?

A. No sir.

Q. And that was in the Fox River?

A. Yes sir.

(F. S. B., Com'r.)

6347 DANIEL C. WOODS, called as a witness in behalf of the defendants, being first duly sworn by the Commissioner, was examined in chief by Mr. Todd and testified as follows:

Q. What is your name?

A. Daniel C. Woods.

Q. What is your business?

A. My business at present is clerk in the Clifton Hotel, Ottawa, Illinois.

Q. Have you done any work for the government?

A. I have done a little lately in the way of reading the gauge of the river for the United States Geographical survey.

Q. How long have you been engaged in that?

A. Oh, a matter of—I should say a matter of a year or more.

Q. Prior to that time were you acquainted with the Illinois river?

A. I was.

Q. How long have you been acquainted with the Illinois river?

A. Well, a matter of—well, I will say forty years.

Q. What opportunities have you had of observing the Illinois river during that period?

A. Well, I have in past years hunted and fished 6348 and sailed on that river. I used to use, you might say, millions of gallons of water from that river in the line of business I was previously engaged in.

Q. What business were you previously engaged in?

A. Locomotive engineer on the C. R. I. & P. railroad.

Q. Were you acquainted with the Illinois river prior to the opening of the drainage canal?

A. Yes, sir.

Q. Describe its condition?

A. From what time?

Q. As much of the Illinois river as you have personal acquaintance with?

A. Well, I mean for what period of time; what year.

Q. Well, any period up to 1900?

A. Well, in the early days, way back, it was not so bad; they hadn't done so much in Chicago to make it bad. After and previous to 1900, after they went to pumping the drainage at Bridgeport, I suppose you gentlemen all know where that is,—that river became fouler and fouler and fouler until it was very foul. The Rock Island road abandoned their tanks in the stations in Joliet, and built a coal chute and tanks out about a mile and a half from the station. I suppose you have seen that. Now, that water was so foul that the Rock Island road was obliged to put in some filters, and they put in two very
6349 large filters that cost quite a sum of money, and while they were cleaning one filter they had to use the other filter; but even with using the filter the water was so foul that when it was running from the crane into the tank, if the wind happened to blow toward the engine, it was sickening on the engineer; it was a foul, stifling smell, and after taking the water on the engine any little steam escaping from the gauge cocks or from the boiler head would sicken you with the foul smell. Now these filters I spoke of, Mr. O'Brien, the man who had charge of all the water business—

Q. Never mind about going into that, just confine yourself to the river from Joliet down?

A. Yes, I was coming to that; I was going to say in regard to the water, if you will pardon me a minute, I just want to make that point,—that he had the utmost difficulty to hire men to clean those filters out; had to pay them extra pay; couldn't get men. That is how foul it was—to clean those filters. Well, now, at another place there, another point on that water in winter time when the river was froze up, then the water was foul, the gas and smell from that water was frightful at that time.

Q. At what point was this?

A. At Joliet station.

Q. Well, how about in the neighborhood of Ottawa?

6350 A. Well, you take it in the summer time when the river was not frozen, approaching Ottawa on a still night with the breeze blowing towards you, three miles before you reached Ottawa you would reach the smell, and the smell would continue until you was more than that beyond Ottawa, going west, and of course that was governed a good deal by the wind that was blowing, you know,—how you would get it.

Q. Were you on the river at any time prior to the opening of the canal in 1900?

A. Oh, yes, from time to time, yes.

Q. What was the condition of the water in the Illinois river?

A. Well, the condition of the water where I was on the river was of course much better than it was where we are speaking of, because it was many miles down the river.

Q. Where was it that you were on the river?

A. Well, from Bureau, and up around Bureau, hunting and fishing there. Of course it was very much better that distance from Joliet—the water improved as the water diffused itself in traveling.

Q. Now, in the neighborhood of Ottawa,—were you ever out on the river at this point?

A. What time are you speaking of?

Q. Prior to 1900?

6351 A. Well, I don't know as I was at Ottawa, out on the river, no.

Q. What has been the condition of the water since the opening of the drainage canal?

A. Oh, all the difference in the world. It is now what you would say a clear stream. In fact, if a man was not acquainted with the facts and knew that the drainage canal was coming into the river, he would never imagine for a moment but what it was the same as any other river that arose from a good course and continued on its way; he would never imagine but that it was the same as any other river of that kind.

Q. How often have you seen the river in the last year?

A. Oh, twice a day—I see it every day.

Q. At what point do you see it?

A. At the C., B. & Q. railroad bridge; I go to get my gauges.

Q. Do you notice any smell on the river now?

A. Not a particle, any more than any stream you would find in the country that was a clear, nice river.

Q. What is your opinion as to the effect of the opening of the drainage canal on the Illinois river?

A. The effect on the Illinois river?

Q. Yes, sir?

A. Why, it has changed it from a vile stream,—a stream that you would know at one glance was vile, that you
6352 wouldn't eat a fish out of the river, to a nice clear stream
that you would class with any other stream. The fish in the river—in fact, they are catching lake fish right here at Ottawa, lake fish from Lake Michigan, the same as you would catch in Chicago.

CROSS-EXAMINATION, by Mr. Jeffries.

Q. Did you ever fish in Lake Michigan?

A. Many a time.

Q. And they are the same fish?

A. Same fish; I have caught the same fish in Lake Michigan.

Q. What do you say to this proposition that the lake fish will not live in this water?

A. Well, I have seen them and had them in my hand. I don't ask any man. I have had them right in my hand, right down at the bridge, at this bridge where I go to get the gauge of the river every day. There is a great many men and boys fishing there, and it is a frequent thing for me to go down and see what they were doing and ask questions of course. They said they were catching perch and I would look and see what kind they was. They were the same lake perch I was catching in Chicago myself.

Q. Do you take the gauges of the river every day?

6353 A. Yes sir.

Q. What time of the day?

A. I get it in the morning; I time myself in the morning;—at 6:30 every morning, and 6:30 at night; that is the time I get it for the government. I get up at half-past five and go down the river.

Q. And you gauge it twice a day?

A. Yes sir.

Q. And do you keep a record of those?

A. Yes sir, the record is on my desk at the present time.

Q. How long does that record go back?

A. Well, I couldn't tell. I will go to the book and show you. A year I will say, perhaps more.

Q. Who kept it before you?

A. Nobody before I did here, that I know of. This is a new survey, the United States Geographical survey.

Q. Do you make a report?

A. Yes sir, every week.

Q. Who do you make the report to?

A. I make the report to—now to 263 Dearborn Street. Previous to that I made the report to Heilbron, 1010 Security Building.

Q. What is the name of the gentleman that you are making the reports to now?

6354 A. Well I have forgot; I could hunt it up on the register. He told me not to use his name, but just use the number, 263 Dearborn Street. Mr. Heilbron was afterwards promoted and then this man took his place.

Q. Do you know what he does with them?

A. Why yes, to denote the volume of water passing down the Illinois River valley.

Q. No, but what does he do with those reports?

A. Well, after I send them to him, I don't know anything more than what he told me.

Q. Do you know whether he keeps them there or not, at Chicago?

A. Yes, I dare say he keeps them, from all that I know and learned about it.

Q. Does he put them in a book and record them?

A. From what I know about it he does.

Q. Do you put them in a book and record them?

A. Yes, I copy each week's readings on a card that is furnished me,—I have a slip out there now, and make a report weekly on this card.

Q. Who furnished you this book?

A. The United States Geographical Survey force.

Q. Do you drink the water of the river?

A. Would I drink it?

6355 Q. Do you?

A. No sir, I don't drink the Illinois River water.

Q. The current in the river is much more now than it was before the canal was opened?

A. I think it is.

Q. Well, you know it is?

A. Yes, I know it is. I have been on that river for forty years. I know how it used to be and I think it is a little more rapid than it used to be; there is more water all the time too.

Q. How far is it from Chicago here?

A. 84 miles they will tear out of your mileage book on the Rock Island Railroad.

Q. How far is it by river?

A. To Chicago?

Q. Yes?

A. The river don't reach Chicago.

Q. Well up to the forks of the river Desplaines and the Kankakee and from there on in?

A. The river Desplaines reaches to Joliet. I always call that the Desplaines that we crossed there.

Q. How far is it by river to Joliet?

A. Well, the railroad is 45 1-2 miles, and I expect the river may be about the same distance, perhaps a little longer.
6356 I don't think it is much longer, though.

Q. Ninety-five or a hundred miles from here to Chicago, is it?

A. No, eighty-four.

Q. Well I am talking about the river?

A. Well the river don't reach Chicago; the Canal reaches Chicago.

Q. No, by water from here to Chicago, through the Illinois river, the Desplaines river and the Drainage Canal and the Chicago River, how far is it?

A. Well now, the distance from Chicago to Joliet by the canal or river, I wouldn't say the exact number of miles because I am not personally acquainted with that, but it is 41 miles by railroad from the Rock Island depot to Joliet and the river may be a little bit longer; I expect it is.

Q. How long have you lived here in Ottawa?

A. This will be my third year since I have been living here. I have been through this town before, all my life, backwards and forwards through this town, since I was thirteen years old, but I have only lived in this town three years.

(F. S. B., Com'r.)

6357 GUSTAVE KNEUSSL,

called as a witness in behalf of the defendants, being first duly sworn by the Commissioner, was examined in chief by Judge Johns and testified as follows:

Q. What is your name?

A. Gustave Kneussl.

Q. What is your residence and occupation?

A. My residence is on 617 Illinois Avenue; my occupation is druggist.

Q. Where do you live with reference to the Illinois river; how close to it?

A. I live within ten yards of it.

Q. In time of high water are your premises overflowed in any part of them?

A. Yes sir.

Q. How much of it?

A. Why, what we term the pasture, that is a lot, oh, possibly 200 feet from the river bank.

Q. Were you residing there prior to the opening of th drainage canal in January, 1900?

A. Yes sir.

Q. Now what was the condition of the Illinois river
6358 prior to the opening of the drainage canal?

A. The condition of the Illinois river prior to the opening of the canal has always been, during the summer months, especially in the months of August and September, practically clogging up the channels between islands, and running from ten to 100 feet out into the stream on both sides of the Illinois River from the Illinois wagon bridge down to the rocks, that is the point of the first island, the mosses and high grass making it impossible for row boats to go through.

Q. As to its color and odor, what was it?

A. Well, of course that was always a stagnant water, you know, with an odor, an offensive odor, decaying vegetation and such as that.

Q. Do you know anything about this odor in the winter, under the ice?

A. Why a little, not very much, and what I do recall is that oftentimes there was a stagnant odor.

Q. Now in times of flood, and after the waters receded, what was the condition of the adjoining land, the land that had been flooded?

A. Why, there would be a deposit of mud, running from one-half an inch to three inches, and full of weeds and stuff of that kind,—debris.

Q. Did that mud have an odor?

6359 A. Why not that I can say.

Q. Now since the opening of the drainage canal, what has been the condition?

A. Why, there has been a clear channel in the last two years; I have not noticed any moss growing between the islands nor any moss, sea grass and weeds on the shores at all.

Q. Now as to the current, has it been greater or less than before?

A. Oh, it has been greater, much greater.

Q. Since the opening of the drainage canal, have there been the usual floods here?

A. Why yes.

Q. In what condition did it leave the banks of the river when the waters receded?

A. Why just as before, muddy deposits, that's all.

Q. Any different in character, that you noticed?

A. No, not that I noticed.

Q. As to the color and smell of the water, has there been any odor in it since the opening of the canal?

A. Why I didn't notice any odor; Monday or Tuesday I rowed down to Starved Rock in a row boat and back, and the odor of the river, why it didn't amount to anything.

Q. This is the season of the year when ordinarily before the opening of the drainage canal the river was very bad?

6360 Objected to as leading.

A. Yes sir.

Q. Is the water clearer now than before the opening of the drainage canal?

A. Why I really couldn't say; I really couldn't answer that.

Q. Is its general condition better or worse than since the opening of the drainage canal?

A. Why, much better.

CROSS-EXAMINATION,

By Mr. Jeffries.

Q. There is some odor since the canal was opened, is there not?

A. Why, not to my knowledge, no; I mean by that no more than any river would naturally give off an odor. Any water has an odor; but outside of that I would say there was not.

Q. What did you say your business was?

A. Druggist.

Q. How long have you been engaged in that business?

A. About 22 years.

Q. At this place?

A. Yes sir.

Q. How often were you upon the river?

A. Oh, I am on the river on an average about—well, previous to this year, on an average of twice a week in the summer time.

6361 Q. What are you doing? What were you doing?

A. Rowing, and previous to that I used to fish.

A. You say the water became stagnant prior to the opening of the canal?

A. Yes sir.

Q. That was only during the low stages?

A. Well, I should judge from the months of July until freeze-up time.

Q. What is freeze-up time with reference to this part of the country?

A. Why the last days of November to about the middle of December. The reason I say last days of November is because I distinctly remember one time on the last day of November I skated on the river.

Q. Now this statement that you have made about the river being in better condition than it was prior to the opening of the canal applies simply to the river, judging from its appearance, and you make it with some qualifications, do you not?

A. Why how do you mean that part—to its appearance?

Q. Yes?

A. Well, to its appearance certaintly, and also to your ability to get around in a row-boat.

Q. That is caused by a larger volume of water?

6362 A. Yes sir.

Q. And the current is much more rapid than it was?

A. Yes sir.

Q. In fact there is a good current now at all seasons of the year?

A. Well of course I don't know how it was in the winter, I should judge we have got more current in winter also.

Q. Well, so far as your knowledge goes?

A. Yes sir.

Q. Do you drink the water from the river?

A. No.

Q. Why not?

A. Why I have always had something better along. The fact is, it is too impure, I wouldn't think of drinking the water any more than you would think of drinking the Chicago River water. Then of course, you realize that I am a druggist and I certainly have some regards to the animal life that is in the river. I don't wish to drink one any more than any other.

Q. You are not a physician.

A. No, I am not a physician.

Q. The people here in Ottawa don't use the water of the river for domestic and drinking purposes at all?

6363 A. Not to my knowledge.

(F. S. B., Com'r.)

Whereupon an adjournment was taken to Marseilles, Illinois, at 9:00 A. M., Tuesday, August 18th, 1903.

Marseilles, Illinois, Tuesday, August 18, 1903.

6364 9:00 A. M.

Parties met pursuant to adjournment.

Present, the Commissioner and same counsel representing the respective parties.

T. W. THIRY,

called as a witness in behalf of the defendants, being first duly sworn by the Commissioner, was examined in chief by Mr. Todd and testified as follows:

Q. What is your name?

A. T. W. Thiry.

Q. Where do you live?

A. Marseilles.

Q. What is your business?

A. Cigar manufacturer.

Q. How long have you been in that business?

A. Been in that business for about eight years.

Q. How long have you lived in Marseilles?

A. About eight years.

Q. Are you acquainted with the condition of the Illinois river at this point?

6365 A. Yes sir, considerable.

Q. What is the name of the river at this point?

A. Illinois.

Q. What opportunities have you had of observing the Illinois river during the last eight years?

A. Well, I have visited there on an average of twice or three times a week. I have fished in it and I have ate the fish.

Q. What was the condition of the Illinois river before the opening of the drainage canal in 1900?

A. In what respect; in regard to low water?

Q. In regard to the quality of the water, and the character of the water in the river?

A. Well it was not near as high at that time, and a sort of a greenish hue and during the summer months it would smell bad.

Q. How bad was the smell?

A. Well it was so that when you went down near the banks you could distinguish it very easily; it was not a very pleasant odor.

Q. What effect has the opening of the drainage canal had on the water at this point?

A. Well, it seems to have changed it to a sort of a blue, and it has taken the scum off the river, and a better flow; it seems to be better and larger.

6366 Q. How is it as to color?

A. Well before it was kind of a greenish hue and now it is a nice blue—not at all times of the year, but then, take it when we have no rains and let it drain out for three or four days and it turns to a nice blue color again.

Q. How do the fish compare today with what they were before the canal was opened?

A. Well, before this drainage came in, the fish seemed to have a kind of tarrish taste, gassy, and this year we have not been bothered with it at all. We don't taste it at all.

Q. Do you find the same kind of fish in the water now that you did before?

A. Yes, we have got several varieties that we didn't have before.

Q. What ones?

A. What we call the cisco, it is a kind of a herring, and we get these lake perch down here and there is another fish here—well, pickerel has been plentiful this year, at the right part of the year.

Q. Do you know whether there is as much malaria here now as there was before the opening of the canal, or was there any malaria here before the opening of the canal?

A. Well, with regards to that I don't know,—the people are generally pretty healthy here on account of the artesian water. We don't drink any surface water at all. 6367

Q. Have you any typhoid fever in this town that you know of?

A. Not that I know of.

Q. How large a town is Marseilles?

A. About 2500 I should judge.

CROSS-EXAMINATION,

By Mr. Jeffries.

Q. Where do the people in Marseilles get their water supply?

A. At the present time?

Q. Yes?

A. Mostly from artesian wells. We have got a water system here but we don't rely much on that. In fact it is not in many of the houses.

Q. Where does this water system get its supply?

A. From an artesian well.

Q. Does anyone use the water from the Illinois river?

A. No, they wouldn't use it from the Illinois river.

Q. And they do not use it?

A. No.

Q. How deep are those wells?

A. Well this well—this artesian well down here is about 600 feet. Most of them run about 300 I guess.

Q. How large did you say this place was?

A. I should juge about 2500. Some claim more.

6368 Q. You don't know anything about the water in the river as far as its quality is concerned, for sanitary purposes, do you? Household and domestic uses?

A. They don't use it at all.

Q. So from what you said on that subject you judge only from the appearance of the water?

A. Well, not from the appearance. Of course a man can tell a good deal by going down there as much as I have been, probably the smell of it and the like. Even now you take it below the dam and before this flow came in and there was a nasty, yellow scum that run almost across the river, that gathered there, and you don't see it today.

Q. Do you know of anybody that does use the water for drinking purposes?

A. I don't think it is used for drinking purposes.

(F. S. B., Com'r.)

6369 **G. W. SMITH,**

called as a witness in behalf of the defendants, being first duly sworn by the Commissioner, was examined in chief by Judge Johns and testified as follows:

Q. What is your name?

A. G. W. Smith.

Q. What is your residence?

A. Marseilles.

Q. And your occupation?

A. Furniture business now; undertaker at the present time.

Q. Have you any official position in Marseilles?

A. Not at present, no sir.

Q. Have you ever had?

A. Yes sir.

Q. What?

A. I was Mayor six years ago, six to eight years ago, and I was in the Council as trustee and alderman for about ten years prior to that.

Q. How long have you lived in Marseilles?

A. Thirty years.

Q. Have you been engaged in any manufactory here?

A. I was working for the Marseilles Manufacturing Company for twenty years.

6370 Q. What is their business?

A. Corn shellers and agricultural implements.

Q. Have you been acquainted with the water of the Illinois river for some years prior to the opening of the drainage canal?

A. Yes, so far as the flumes was concerned, the water coming in through them.

Q. What were the flumes used for here?

A. Used for running the wheels, that is the race comes down through and the water comes through and the wheels furnish the mills and factories.

Q. Water power here?

A. Yes sir, water power.

Q. Now what was the condition?

A. The condition was very bad.

Q. In what respect?

A. Well, when the water was frozen over why it would pretty near make one sick to go into the mill. When you would go into the mill where the flume is, it would always be open there, that steam would come right out; the gas was so strong it was hard for men to work in there almost at times.

Q. What kind of an odor was it; how did it smell?

A. Why, it smelled like dead animals, fish, a stinking rotten smell,—decaying vegetables and everything else; very disagreeable.

6371 Q. Was it more disagreeable in the winter than in the summer?

A. Yes sir.

Q. Did you also notice that smell in the summer, in low water?

A. Yes sir, to a great extent, but not so much.

Q. Now from these flumes,—they are fed from the Illinois river?

A. Yes sir.

Q. And the water passing again into the Illinois river?

A. It passes back below the dam; they take it into the race above the dam and it goes out below.

Q. Now since the opening of the drainage canal, what do you say with reference to the water here?

A. I consider the water far better than it ever was before.

Q. Well, in what respect?

A. The water is clearer and when the water is clearer there is less color to it. Prior to that the water was so dark colored you could hardly see through it. Now it is very clear noticeably along the river.

Q. Is there an odor now upon it?

A. Not that is noticeable. There might be a trifle perhaps in the winter, but not that is noticeable; nothing to what it was.

6372 Q. None of that very offensive odor that it had before?

A. No sir.

Q. Now have you noticed the water in its steam making capacity?

A. I have not, not since the new water has been in.

Q. Had you noticed it before?

A. Yes sir.

Q. Its action in the boiler, what was it?

A. It had a tendency to foam where you used a great amount of it, unless the boiler was frequently cleaned.

Q. And when cleaned what kind of a sediment came out?

A. Well, it was a filthy, dirty sediment. Well,. the water will form a scale anyway; it would before, because the water is hard in the river. It would make a scale. When it burned down it was more like a muddy, yellowish color. You can tell good water from the color of the water you are using.

Q. The water supply of the inhabitants here is derived from what source?

A. For domestic purposes?

Q. Yes?

A. Artesian water.

Q. Now when you use the term artesian, do you mean water that flows up over the top—

6373 A. Well yes, we pump; we pump from the St. Peter's rock. These are dug wells here that they all use; they are all bored wells.

Q. How deep are they?

A. The first flow is evidenced about 100 feet. It will vary a little from that in different localities, but the average is about 100 feet. That is from the St. Peter's rock; it is known all over this country.

Q. Is there a sewerage system here?

A. No sir.

Q. Are there private sewers?

A. More or less, yes. That is, from house to road, to some ditch, open ditches, but no regular system.

Q. Well, take such sewage as is discharged here, where does it finally go?

A. It goes to the river.

Q. In times of flood, or hard rains do the surface waters run into the Illinois river?

A. Yes sir.

CROSS-EXAMINATION,

By Mr. Jeffries.

Q. How far is the town located from the river bank?

6374 A. It goes right down to it. This part of the town, the center part of the town is probably very nearly a quarter of a mile to the river there.

Q. The residence part of the town is down on the river?

A. Yes, the residence part is down on the river, yes sir, and then it is back too, on the bluff.

Q. The people here in this place don't use the water do they, for domestic and drinking purposes?

A. No sir.

Q. Do you know whether or not the people in any of these other towns along the river here use the water for drinking purposes?

A. I don't think they do; I don't think Ottawa does; they may have used it in the past, but they don't now, I know.

Q. When did you quit working for this manuafcturing company?

A. Ten years ago; eleven years ago the first of June.

Q. You haven't worked there since the canal was opened?

A. No sir.

Q. Have you been running engines since that time?

A. No sir.

Q. Boilers, or anything of that kind?

6375 A. No sir.

Q. You don't know what the condition of the water is now?

A. Only from observation and smell, by passing over it.

(F. S. B., Com'r.)

6376 DONALD A. NICHOLSON,

called as a witness in behalf of the defendants, being first duly sworn by the Commissioner, was examined in chief by Judge Johns and testified as follows:

Q. What is your name, residence and occupation?

A. Donald A. Nicholson; I am a police magistrate here of the city of Marseilles.

Q. How long have you resided in the city?

A. Upwards of forty years.

Q. Is your residence near the Illinois river or removed from it?

A. I am about, well, probably a little over a quarter of a mile from the river. My residence is right under the bluffs here, and the river is a little over a quarter of a mile perhaps.

Q. Are any parts of the city of Marseilles overflowed at time of extreme high water in the Illinois river?

A. Yes sir.

Q. How much of it?

A. Well nothing north of the canal, the Illinois and Michigan Canal; it overflows some down there, and below town, down to what we call Matchtown; it got its name from formerly being a match factory there.

6377 Q. Were you acquainted with the condition of the Illinois river at this point before the opening of the drainage canal?

A. Yes, sir.

Q. Describe its condition?

A. The water was in a very bad condition. It had a kind of a soapy, greasy appearance on its surface, dark colored, and a green scum would form on top of the water. I at one time had charge of the water power company here and their works were up on the river above the head gates there, where the water was kind of still. I have seen the scum form there six or eight inches thick, a green scum, and after it would lay there a few days in the hot sun there would be a very bad stench coming from it.

Q. Now since the opening of the drainage canal what has been its condition?

A. The water is very much better, it is clearer, and that offensive odor is not there. Before the drainage water was turned in, especially in the evening, I could smell the water from the river up to my house where I lived there.

Q. Could you describe the odor?

A. Well it was—it had somewhat the smell of a privy, an outhouse and as though there might be dead fish or dead animals of some kind.

Q. Now since the opening of the drainage canal, have you
6378 any of that odor?

A. None of it at all; can't discover any.

Q. Is there a dam here in the Illinois river?

A. Yes sir.

Q. Is it known as the Marseilles dam?

A. Yes sir.

Q. What is the flow fall from the crest of the dam to the apron?

A. The dam when originally built was eight feet and a half I think.

Q. Fall?

A. Yes sir.

Q. Well is it higher or lower now?

A. It is perhaps a little bit higher; not very much; it has been repaired somewhat and the action of the water in going over the dam has naturally worn the rock away a little below, so as to make a little more of a fall than it was before, not very much.

Q. Did the power company put flash boards on the dam here?

A. Not since the drainage was turned in.

Q. Did they before?

A. Occasionally, yes; in low water they did.

Q. What was the height of the flash boards above the crest of the dam?

A. Generally about twelve inches.

6379 Q. How much manufacturing is done here by water power?

A. We have three paper mills, one agricultural works; we have a box factory, in fact two box factories now—Howe & Davidson have one. In fact all the manufacturing that is done here is done by water power. At the present time however, it is not, because the water is out of repair.

Q. What is the capacity of the paper mills here?

A. They run from six, I think to thirty tons.

Q. Per day?

A. Per day, yes sir.

Q. Do you mean the three together, or each one?

A. Each one.

Q. From six to thirty tons a day?

A. Yes sir.

Q. Now what is the waste matter from the paper mills here, what kind of looking stuff is it?

A. There is really no waste to speak of, excepting the liquid that the stock is cooked in which is composed almost exclusively of water and lime.

Q. What kind of looking liquid did that form when it ran off?

A. Well, it would be a dark colored liquid, especially where it cooked straw, it would be dark.

Q. And where did that go?

6380 A. That goes into the river.

Q. That is water mixed with lime and with some of the chemical substances that are used?

A. Yes sir, sometimes some chemical substance.

Q. Now is that a constant, regular thing here, or do they turn that in only at intervals?

A. Only at intervals.

Q. Have you any idea how much water is used here per day that is discharged into the river?

A. No, I couldn't tell; they use a large amount of water.

Q. Have they been running continuously since January, 1900, these paper mills?

A. Yes—well, the large one has not been in operation all that time, what is called the Howe & Davidson House.

Q. How much of the time has it been operated in the last three years?

A. In the last three years, it has been in operation perhaps about a year, may be a year and a half; it burned down at one time.

Q. And the other two?

A. One of the others has been in operation perhaps for—oh, it has been in operation for 25 years.

Q. And has it operated continuously since January, 1900?

6381 A. Yes sir, until recently.

Q. And the others?

A. The others the same.

Q. From what material do these institutions make paper?

A. Mostly of straw.

Q. You have no wood pulp manufacturing?

A. Yes we have wood pulp here too, but that has only been in operation I think, for the last—for about five years perhaps.

Q. How large an institution is that?

A. They will have, when they start up now, I think about eight stones for grinding the pulp; it is something like a mill stone, only they work the other way. The revolve and the wood works up against the stone.

Q. Is the wood ground in water here or ground dry?

A. They have water.

Q. Do they keep a continuous stream of water running over the stone as the grinding is done?

A. I think they do, yes.

Q. Now what kind of a liquid does that discharge into the Illinois river here?

A. That would be kind of a light substance, there would not be much to it.

Q. Was there any acid or chemicals mixed with it?

6382 A. No sir.

Q. Just the ordinary washings of wood pulp?

A. That is all, and the bark is taken all off the wood before it is ground, so that there would be no dark substances there.

Q. Is the bark used here then in some other—

A. No, the bark is ejected, I think it goes into the river perhaps.

CROSS-EXAMINATION,

By Mr. Jeffries.

Q. Isn't the bark burned in some way after it is taken off?

A. I suppose it would be.

Q. Well I say, isn't it—don't they burn it?

A. I don't think so. I have been around the mills a good deal and I never saw any burn.

Q. You have seen the color of this water that comes out from this pulp into the river?

A. Yes sir.

Q. Well that is white, isn't it—water color?

A. Yes, it is about the color of water, if they had a wood that was dark colored it might make the water a little dark.

Q. There are no chemicals, you say?

A. No chemicals used.

6383 Q. Now how many such plants are there here?

A. Of wood pulp?

Q. Yes.

A. Only one.

Q. What was this other plant that you say was here

A. They manufacture principally straw-board.

Q. From this wood pulp?

A. No, there is very little wood pulp used in that kind of work.

Q. Well that is another company now that you have referred to?

A. The wood pulp is used principally in print paper.

Q. You say there is a straw-board company?

A. Yes, two of them.

Q. Do you know the character of the water from that that runs into the river—any chemicals used there?

A. Yes, there is some chemicals used there.

Q. But they don't escape into the water?

A. Yes sir.

Q. You know that do you?

A. Yes sir.

Q. Are you a chemist?

A. No sir.

Q. All you know is what you observed?

6384 A. Well, I had charge of these mills and know pretty near what the process is in the manufacture of paper.

Q. How much of the chemicals escape?

A. All of it that is used which is not retained by the pulp, it goes into the river.

Q. How much is there used?

A. Oh, it depends on the grade of paper that we are making. There is really no chemicals used in straw, but they have old papers, print papers, old newspapers that they use chemicals to take the ink out.

Q. You have not examined the water in the Illinois river, have you for the prpose of determining what solid matter it contains?

A. No sir.

Q. You don't know anything about its chemical ingredients or constituents?

A. No sir.

Q. You don't drink the water from the Illinois river?

A. No sir. F. S. B., Com'r.

6385 JAMES BRUCE,

called as a witness in behalf of the defendants, being first duly sworn by the Commissioner, was examined in chief by Mr. Todd and testified as follows:

Q. What is your name?

A. James Bruce.

Q. Where do you live Mr. Bruce?

A. Marseilles.

Q. How long have you lived here?

A. Eight years.

Q. What is your business?

A. Grain merchant.

Q. Where you acquainted with the Illinois river prior to the opening of the drainage canal?

A. Yes sir.

Q. How long have you been acquainted with the Illinois river?

A. Well I have been on it practically all my life, since I was a boy.

Q. What part of the river are you acquainted with?

A. All the way from the head waters down to La Salle.

Q. What point on the head waters?

6386 A. Well I mean the junction of the two rivers, clear up to Romeo or Lemont on the Desplaines, or to Wilmington on the Kankakee.

Q. Prior to the opening of the canal what was the condition of the Illinois river?

A. Well, during the summer months, dry seasons, why the river was very low; showed the effect of the drainage of Chicago; and the gases from the river were very strong. There was places in the river where it showed stagnant water, covered with green slime. Today I think that is all disappeared with the extra head of water and very little gas is found.

Q. What improvement, if any, have you noticed in the waters of the Illinois River at this point,—Marseilles?

A. Well, there has been a general improvement. There is very little gas as I could detect now coming across the bridges, and when you would smell the gases take a still evening; there is practically no gas on the river; the river is fairly clean so far as I can see; no stagnant water; the water has a good flow.

Q. Prior to the opening of the canal you speak of gases—what opportunities have you had to observe the operation of the gas from the Illinois?

A. Well, at Joliet, my old home, especially between Lockport and Joliet, it showed the effect of the gases on the
6387 houses there. If you painted a house, inside of a year it
would turn black, like my father's place there, we didn't paint our house for two years, or until the drainage canal was completed, on that account.

Q. Since the canal was opened, what has been the effect?

A. Well, that trouble has disappeared entirely; we have no such trouble.

Q. How about the quality of the fish in the river, do you know anything about that?

A. Well the game fish is all returning up here where they disappeared before, and the cats coming up and there is fairly good fishing here now, where heretofore they had disappeared.

CROSS-EXAMINATION,

By Mr. Jeffries.

Q. What is the difference between the flow of the current now and what it was before the canal was opened?

A. You mean how much faster it is?

Q. Yes?

A. Well, you take from up the river above the dam here, there is a strong current up here now; in fact you can hardly go against it from here up to Seneca. Before there was very
little current there, and there is a good flow over the dam
6388 now.

Q. When there was no flow over it?

A. Practically none—no flow over it at all; you could trace the dam clear across. The races took it all here. Now there is I guess, six inches to a foot and a half at different stages, on account of the dam.

Q. You don't drink the water of the river?

A. No.

Q. And the people here do not?

A. No.

Q. You don't know whether it contains the same decayed matter that it did prior to the opening of the canal or not, then?

A. Well I know this, that before the bed of the river showed the effects of the sewage of Chicago, while that has practically disappeared today.

Q. It has washed away?

A. It has washed away, and the rocks all covered with black slime before. You could hardly step on it, while today you go into the bed of the river and it is practically clean.

Q. How often do you go on the river now?

A. Well, take during the summer months not very often; through the fall and the spring of the year I am on it a great deal; I fish some.

6389 Q. In the winter months?

A. No, take through the spring an along through May and June, why I hunt and fish a good deal.

Q. Now there is some odor arises from the river in the spring when the ice goes out?

A. Very little.

Q. There is some?

A. Yes, there is some. You can detect it if the air is just right,—a slight odor, but not very often.

Q. How wide is the river at this place?

A. Well, I couldn't tell you how many feet; there is five spans on the river bridge there.

Q. Well about how wide would that be in your judgment?

A. Oh, somewhere around eight or nine hundred feet.

Q. About three hundred yards?

A. Yes sir, at this point here. If there is any gas in the river it ought to show more than any other point, because the water is churned up thoroughly here on account of the dam and the rapids. Perhaps you wouldn't detect it above here, but you could here because it is stirred up.

Q. Where are those rapids?

A. Why, the dam is just above, about half a block up this Main street, while the rapids run down here very nearly a mile and a half.

6390 Q. Below the dam?

A. Below the dam.

Q. How deep is the water over those rapids?

A. Why, all the way, I guess from two to three feet deep now, while before the drainage water came down, it wasn't passable in a row-boat; you had to go out.

F. S. B., Com'r.

6391

W. H. SPENCER,

called as a witness in behalf of the defendants, being first duly sworn by the Commissioner, was examined in chief by Judge Johns and testified as follows:

Q. You may state your name, residence and occupation?

A. W. H. Spencer, my residence is Marseilles; my occupation is that of a grocer.

Q. How long have you lived in Marseilles?

A. I have always lived in Marseilles, except while I was in the country, until I was three years old—since I was three years old.

Q. Have you been acquainted with the condition of the Illinois river here before and since the opening of the drainage canal?

A. I have.

Q. What was its condition before the opening of the drainage canal in January, 1900?

A. Well its condition was then at various times during a rainy spell, it was just what you would call an ordinary river, but in the dry of the summer, when the water would get low, there would be a green scum form over it; it would smell very bad, and in the winter time when it froze over, the water 6392 would churn up in going over the dam and if there happened to be a south wind, the stench was almost unbearable at times, especially if it had been frozen over a long while, and turned warm.

Q. That is the south wind would bring the odors down?

A. The south wind would bring the odor down.

Q. But the stench would be there just the same?

A. The stench was there just the same, but it would go the other way when the wind was in the north it woudl bear it over the other way.

Q. Could you describe tht stench, what is seemed like?

A. Well, I don't know as I could. Smell is something hard to describe. It was like an outhouse that the city scavenger would condemn to be cleaned out. That is about as near as I can express it.

Q. Now after the opening of the drainage canal and up to this time, what has been the condition of the river?

A. Why I haven't noticed any of those conditions mentioned. I notice that the water is much clearer, and I have never noticed the smell since.

Q. Are you much upon the water yourself?

A. Why, I am not upon the water; I frequently go to the river—quite often go there of a pleasant Sunday; there is
6393 a nice walk along there, and my business takes me down there sometimes and I am this close to the river. My store is right just as close to the river as the hotel. My house is just as close as the hotel.

Q. How far are we now from the river?

A. Why, about a quarter of a mile, I think.

Q. Have you observed the odor of the water in the winter here in the flumes around the dam?

A. Do you mean recently?

Q. Yes?

A. No sir, I have not observed any odor since the drainage canal was turned in.

Q. Well, had you noticed it before?

A. I noticed it before, yes. I had noticed it almost,—well any time that I would go down to the river and any time as I speak of, when there was a south wind to blow it towards town.

CROSS-EXAMINATION,

By Mr. Jeffries.

Q. Before the canal was opened, and the stench would get very bad, here, there was no current, was there, in the river?

A. Why at times there was a current, and at times there
6394 was not; I think it was worse when there was no current than it was before.

Q. It smelled at all times of the year?

A. Yes,—Well, I will take that back—after a hard rain, when there would be lots of fresh water all over the country, apparently it would dilute the water so that you would not notice the smell so much, but as quick as the abnormal rise in the river caused by the rains would go down, you would smell the smell; the lower the water got the worse the smell was.

Q. You don't know of anybody that uses the water in the river for domestic purposes?

A. No sir, I do not; we have good water laying 100 feet under us here, flowing artesian wells all through this valley.

Q. Well, you wouldn't consider it a good water anyway, would you?

A. Why I never lived any place where their custom was to use river water for domestic purposes. I have always been accustomed to either dug wells or flowing wells, artesian wells. I suppose if a man couldn't get anything else, it would be better than none.

Q. So you have noticed no odor whatever since the canal was opened?

A. Why I haven't noticed it, no sir.

6395 Q. How often are you on the river since the opening of the canal?

A. You mean across the river?

Q. On the river?

A. Why I never go on the river as far as that is concerned.

Q. You just go down to it and look at it?

A. I just go down to it and look at it and cross it on the bridge.

Q. Were you there last week?

A. Yes, I was along the river last week.

Q. How many times?

A. I think twice.

Q. How many times the week before?

A. Well I couldn't tell; I think probably about twice, I wouldn't swear to that exactly. My business takes me down there every week at least two or three times.

F. S. B., Com'r.

6396 A. S. GUM,

called as a witness in behalf of the defendants, being first duly sworn by the Commissioner, was examined in chief by Judge Johns and testified as follows:

Q. What is your name, residence and occupation?

A. A. S. Gum; Marseilles, eastern part of the city. I live a mile from here almost.

Q. What is your business?

A. Teaming.

Q. How long have you lived in Marseilles?

A. I have lived here over sixty years.

Q. Are you much upon the Illinois river in boats or otherwise?

A. Why, I often go fishing and have been any time when there is fishing, and like that.

Q. Do you fish with rod and line?

A. Yes sir.

Q. What was the condition of the Illinois river at this point before the opening of the drainage canal?

A. That is how long ago, did you say?

Q. It was opened in January, 1900, three years ago last January?

6397 A. Well, it is better; we don't get such a stench as we used to; the worst we used to get was in the winter when it was frozen over and then dropped over the dam; that was when we would notice it the most. Where I live, that is all of a mile from here when the wind was from the southwest.

Q. Did you notice the odor much in the summer?

A. Yes,—well I will say not as much as we did in the winter.

Q. What was the appearance of the river here above the dam in the summer?

A. Well it was kind of a dark water, like—of course it wasn't as dark as it has been often, but it is clearer than it was before the current went through.

Q. Before the opening of the dranage canal in January, 1900, did a scum form here upon the river?

A. Yes sir, it did; it did sir, for a fact.

Q. Could you describe this stench that you mentioned?

A. Well, it was like a kind of a rotten smell; I don't know how you would come at it. It was a very disagreeable smell; you would want to get out of it as soon as you could if you was any place where you could inhale it.

Q. Now since the opening of the drainage canal, have you had any of this odor?

6398 A. Not so much, no sir; I haven't noticed it. I don't notice it since, as I used to.

Q. Have you noticed here in the winter time, since the opening of the drainage canal, any of this odor?

A. Well, I don't hardly think I have; I don't remember of it.

CROSS-EXAMINATION,

By Mr. Jeffries.

Q. You are not sure though, that there has been no odor since the opening of the canal?

A. Well, you see I live about a mile from here, and it would not be every day; it is when the wind is from the southwest that I get the most of it where I live. That is when I used to get it.

Q. There is an odor though, coming from it in the winter time, is there not?

A. Well, I haven't noticed it as I could say.

Q. The current is much more rapid now than it was before the canal was opened?

A. Yes sir, the water is purer and more clear than it was.

Q. When you say it is purer, you simply say so from observation?

6399 A. It is clearer, with a current in it.

Q. Well you say it is purer simply from observation, that is the only way you know of judging?

A. That would be it, yes sir.

Q. You don't drink the water from the Illinois river?

A. Oh no, we have good water here.

F. S. B., Com'r.

6400 **H. R. ADAMS,**

called as a witness in behalf of the defendants, being first duly sworn by the Commissioner, was examined in chief by Mr. Todd and testified as follows:

Q. What is your name?

A. H. R. Adams.

Q. What is your business?

A. Manufacturing agricultural machinery.

Q. What concern are you connected with here, Mr. Adams?

A. The Marseilles Manufacturing Company.

Q. In what capacity are you engaged with that concern?

A. I am Vice President.

Q. How large a business is carried on by that concern?

A. Well, we employ from 150 to 250 men.

Q. How long have you lived in Marseilles?

A. I came here 36 years ago the 4th day of March.

Q. Are you acquainted with the Illinois river?

A. Yes sir.

Q. How long have you been acquainted with it?

A. A little over—well 36 years ago in January was the first that I came down on the river.

6401 Q. What was the condition of the Illinois river prior to the opening of the drainage canal?

A. The water was very impure; the water of the stream rising from swamps largely; the water was in a very impure condition.

Q. Were you acquainted with the river before the sewage of Chicago was turned into the Illinois and Michigan Canal?

A. Yes sir.

Q. Describe the conditions that existed at that time?

A. Before there was any sewage sent this way, the condition as I was saying, was very impure, so much so that we didn't dare to bathe in it for fear of getting mud itch, and it was quite a dark, dense color, and there was a good deal, at times of a kind of a formation, what we used to call frog spawn, at certain seasons of the year, would come down, and the water was not pure enough so you could see any depth in it.

Q. When the sewage of Chicago was turned into the Illinois and Michigan Canal, did it have any effect upon the Illinois river?

A. Yes sir, well, for some time we didn't notice the effect very much, but as it increased, there was a bad odor to it, and if the water was not high, so that there was a rapid current, you would see a kind of an oily substance on the surface, and this vegetable or spawn appearance increasing.

Q. Now just before the opening of the drainage canal, what was the condition of the Illinois river at this point?

6402 A. Well it was bad, as I have described.

Q. Was there any odor to the river?

A. No smell as of sewage; simply there was a swampy smell to it always.

Q. I mean immediately before the opening of the drainage canal in 1900?

A. Oh, the drainage canal—excuse me. Yes, there was quite a strong smell of this vegetation, to a very serious extent, so much so that this formation on top would come down and accumulate in our races here in such beds that it would sometimes obstruct our rights in our wheels, and where the water passes through our shop it was so intensely filthy there that the men's clothes would become saturated with it, and even their systems, so that when they would get away from the shop, sometimes for days, if you went near them, you would smell that shop, what we would call the shop smell of the water, it got very strong.

Q. What power did you use in your manufacturing industries here?

A. We used about 85 horse.

Q. Is that water power?

A. Water power, yes sir.

Q. Since the opening of the canal, what has been the condition of the river at this point?

6403 A. Well, since the opening of the drainage canal the water has improved very much. Well, when they first opened it, at times, there was a lot of that old smell left, but it has been gradually purifying, and during the past year, since they have let in some water, I don't know that there has hardly been a time that we have had any of that smell. Now in our head races, where it used to be so dense that you couldn't see any depth in it, there is a great deal of the time now when you can see two or three feet very clearly, and sometimes even deeper, when we have had no rains for sometime to disturb the soil, or no excavating in it, and the water has a chance to settle; it gets so clear that you can see it quite a depth. That we never could do before.

Q. What in your opinion has been the effect of the opening of the drainage canal upon the Illinois river?

A. It has been a very decided improvement in every way, in health and everything, I think.

Q. Prior to the opening of the canal, what was the condition of the health in Marceilles?

A. In some parts of the town we used to have quite a little malarial fevers, ague and such things as that. Of late I haven't heard anything of that at all. I don't think we have had it.

6404 CROSS-EXAMINATION, by Mr. Jeffries.

Q. How long has it been since they have had malarial fever?

A. Well, I can't say positively, for the reason that I have been away part of the time, but the knowledge that I have had of it is—the last that I knew of anything to amount to anything was four or five years ago, I think that last year, about a year ago now, I think there was a case of malarial fever reported here down here in this low ground district, but I doubt if it could be attributed to the river. I think that would be more local conditions from what I have heard of the case.

Q. You do not drink this water here, do you, that comes through the dam here?

A. No sir.

Q. The flow of the current is very much greater now isn't it, than it was before?

A. Yes, especially through the fall and winter. Last fall and winter we had quite a strong current. It is not very strong at the present time.

Q. You say you don't detect this odor at any time of the year now?

A. I have not noticed the odor—well, in nearly two years when I have gone out through the shop where the water wheels are.

6405 Q. Do you go out there very often now?

A. Yes, I am out there every little while.

Q. Every day?

A. Well, not every day, no sir, but out through there as I am apt to be through other parts of the shop.

(F. S. B., Com'r.)

6406 H. B. McKAHIN,

called as a witness in behalf of the defendants, being first duly sworn by the Commissioner, was examined in chief by Judge Johns and testified as follows:

Q. What is your name, residence and occupation?

A. My name is H. B. McKahin; I am Assistant Secretary of the Marseilles Manufacturing Company.

Q. How long have you resided here?

A. Why, my folks came here when I was about two years old; that would be about 1871.

Q. Have you been familiar with the condition of the Illinois river here before January, 1900, when the drainage canal waters were turned in?

A. Yes sir.

Q. Now were you much upon the river before that time?

A. Well, during the years 1883, 1884 and 1885 I used to boat a good deal up there for pleasure.

Q. In a row-boat or launch?

A. Row-boat at that time.

Q. Now prior to the opening of the drainage canal what was the condition of the water in the Illinois river?

A. Well, during the low stage of water in the summer time, it was very foul, so foul that I had to quit going on the 6407 river much after sun-down on account of the malaria.

Q. Was there an odor that came from the water?

A. A very perceptible odor after the sun left it.

Q. How was it in the winter?

A. Well, in the winter time we were not on the river, but we noticed the water coming through our water wheel at the plant, and the odor there was very foul, very similar to rotten cabbage out of an old cellar.

Q. Now, did it affect the men in the factory?

A. Why, I don't know how it affected their health, but the odor was so strong that you could smell it on their clothes when they came from the wood shop.

Q. After they came away from the place you could smell it?

A. Yes, sir.

Q. Now, since the opening of the drainage canal, how has it been?

A. I haven't noticed anything of the kind.

Q. Has there been any odor to the water here since the opening of the drainage canal?

A. I haven't noticed anything that was anywheres near as strong as it was before.

Q. In the winter how has it been?

A. We don't notice that odor in the winter time.

6408 Q. Nor in the race nor flume of the water power?

A. No, sir.

Q. Before the opening of the drainage canal did a scum form on the water here above the dam?

A. It did.

Q. Was that purely a vegetable, or did it seem to have some foreign substance in it?

A. Well, I would say it was both.

Q. What was its color and appearance?

A. Well, the perceptible part of it was this little plant that seems to grow on top of the water, of the foul water; it would accumulate down here against any obstruction and rot, the race would be full of it.

Q. Would it sometimes obstruct the wheels here in the race?

A. Well, that small plant would not obstruct them as much as the grass that used to come down in large quantities.

Q. Before the drainage canal was opened, was there considerable growth in the river of vegetable and animal life?

A. There was.

Q. What was its character, moss or grass?

A. Well, there was a long grass that would grow in the shallow places, and then this little three-leaf plant that grows on the surface of the water.

6409 Q. What do you call that plant here?

A. I don't know the name of it.

Q. You don't know whether it is called duck-weed, shamrock or water clover?

A. No, I don't. My impression is, though, that we used to call it a kind of a water clover.

CROSS-EXAMINATION, by Mr. Jeffries.

Q. Is your work there at the mill?

A. In the office, yes.

Q. How long have you been working in the office?

A. I have been in their employ since 1886.

Q. Were you out at the water—on the water every day?

A. Why, the head race runs right by the office. I have ten or fifteen feet of it in plain view all the time.

Q. There is a large volume of water now, is there?

A. Yes, sir.

Q. Swifter current?

A. Yes, sir.

Q. The current even runs over the dam?

A. Yes, sir.

Q. At all times of the year?

6410 A. So far as I have noticed. There is water going over the dam all the time now.

Q. There is some odor perceptible yet, isn't there from the water at times?

A. Yes, there is a slight odor there.

(F. S. B., Com'r.)

6411 U. T. SMITH, called as a witness in behalf of the defendants, being first duly sworn by the Commissioner, was examined in chief by Judge Johns and testified as follows:

Q. State your name, residence and occupation?

A. U. T. Smith; I live nearly opposite the depot on Rowe street.

Q. What is your business?

A. Well, it isn't anything in particular now. I run a livery stable here for about twenty years and I farmed.

Q. Have you retired from business now?

A. Yes, sir.

Q. Have you been acquainted with the waters of the Illinois river here prior to January, 1900, when the drainage canal was opened?

A. Yes, I have been here twenty-four years this fall. I have lived in the same place.

Q. What was the condition of the Illinois river at this point before January, 1900?

A. Well, the river was very offensive at that time, it smelled very bad, especially when it froze over a little; there was a terrible stench to it; you couldn't hardly endure it.
6412 In the morning it smelled very bad. In the summer time the water wouldn't run over the dam, it would be sometimes a foot or two below running over the dam and there would be a green scum form over the water, and it smelled very bad.

Q. Now, since the opening of the drainage canal what has been the condition of the water?

A. I have never smelled anything since the drainage water has been turned in; the water looks clear and very nice.

Q. Does this green scum form on the water since?

A. I haven't noticed any since; there is generally water running over the dam ever since the water has been turned in, I think. I have never seen that dam dry, and there is no scum forms on it.

CROSS-EXAMINATION, by Mr. Jeffries.

Q. How often are you on the river?

A. Oh, I don't know how often. I never was on it so very much, but in our livery business we were crossing it sometimes half a dozen times a day and perhaps sometimes not at all on some days.

Q. And the water flows much more rapidly than it did before, doesn't it?

A. Oh, yes; there is more current, sure; the water runs
6413 over the dam, I think, all the time now, some.

Q. You don't drink that water?

A. No, sir.

Q. When you say there has been an improvement in the water you mean an improvement for the purposes to which it is put at this point?

A. Well, it is an improvement as far as the smell is concerned and the water appears to be purer and cleaner and looks clearer.

Q. That is just from your observation?

A. Yes, certainly.

(F. S. B., Com'r.)

6414 G. H. SWADER, called as a witness in behalf of the defendants, being first duly sworn by the Commissioner, was examined in chief by Mr. Todd and testified as follows:

Q. What is your name?

A. G. H. Swader.

Q. Where do you live?

A. Marseilles.

Q. What is your business?

A. Foreman of the Marseilles Manufacturing Company, wood department.

Q. Mr. Swader, were you acquainted with the Illinois river before the opening of the drainage canal?

A. Yes, sir.

Q. What was the condition of that river before the Sanitary District turned in the waters of Lake Michigan?

A. Well, it was pretty bad.

Q. In what way?

A. Well, there was a kind of a slaughterhouse smell to it, as near as I could tell you, in the summer time, this grass seed and stuff would run down the river here and stop us sometimes at the mill, we would have to—it would just almost
6415 hold you up to walk upon it.

Q. What was the color of the water?

A. Why, a kind of—like it went through a sewer like or a water-closet; dirty color to it.

Q. How did the odor of the water affect employes in the business?

A. Well, I don't know as it ever affected me any, but it made some of them sick.

Q. Well, how about the smell of it?

A. Well, it smelled just like—as Mr. Adams used to say, "George, I don't come over to see you very often, you smell like rotten cabbage." That is the way he used to put it, but it smelled like a slaughterhouse, in the winter time especially, more so than in the summer.

Q. What has been the effect upon the waters of the Illinois river of the opening of the drainage canal?

A. Why, we have got more water and it is purer and clearer and better.

Q. What is the color of the water at present?

A. Why, it is a kind of a greenish color, or blue or something like that.

Q. Well, is the water dark now?

A. No, sir; it is not; it is down there in the race where there is no water flows over the dam.

6416 Q. What is its color there?

A. Over there?

Q. Yes?

A. Why, it has more of a color.

Q. Do you observe that odor that you observed before the opening of the canal?

A. No, sir, there is no odor there.

Q. What is the general condition of the river?

A. Through here?

Q. Yes?

A. Why, it is better.

Q. How about the current?

A. Why, there is a lot more water running and of course the current is a lot swifter than it was.

CROSS-EXAMINATION, by Mr. Jeffries.

Q. Do you know whether the sewage from Chicago was turned into the Illinois river or not?

A. Do I know?

Q. Yes?

A. Why, it used to be years ago. They used to pump it up through the locks there at Lockport or Bridgeport.

Q. You don't know anything about it now?

6417 A. I don't know whether it is running down through the river now or not; it may be in the canal; I have never been up there.

Q. Do you drink the water from the river?

A. Why, no, sir, but I have.

Q. Since the canal was opened?

A. Why, not more than I have been placed where I had to. I am situated where if there is anything goes wrong with the wheel I have got to go down there and clean it out; go down into the water. I have drank it, more or less; I have had to.

Q. You don't know anything about what substances are contained in the water, do you?

A. No, sir, I don't.

Q. The people here in town do not use the water for drinking purposes?

A. No, sir, not that I know of. I don't know whether any of the water seeps down here in the reservoir, they have got down here or not.

Q. Is that the water supply?

A. Yes, it leaks, but I don't know whether any of the water goes through there or not.

(F. S. B., Com'r.)

6418 LEANDER G. DOUGLAS, called as a witness in behalf of the defendants, being first duly sworn by the Commissioner, was examined in chief by Mr. Todd and testified as follows:

Q. What is you name?

A. Leander G. Douglass.

Q. Where do you live, Mr. Douglass?

A. At present I live in Marseilles.

Q. What is your business?

A. Well, I am kind of loafing now. I have always been a farmer up to within a few years.

Q. Do you own any land around Marseilles?

A. Yes, sir.

Q. How much?

A. Well, I can't tell you; I own what is on two sections on the north river front between the Illinois and Michigan canal and the river.

Q. About how many acres is included in that?

A. Well, I think the way I got it, there is about 330 or 340 acres. I really have never known its fractional inches and quarters, and so on. My deeds run from canal to river, so I couldn't make any more by measuring it, or any less.

Q. Were you acquainted with the Illinois river before the
6419 opening of the drainage canal?

A. Well, before the opening is a good ways back, but since I have been acquainted with it—

Q. I mean in 1900, the drainage canal?

A. Oh, what has been the condition?

Q. Yes?

A. Why, it has been, I suppose, not entirely free from filth; I don't think it has, but it has been decidedly better than it was before the opening of the drainage canal, the river has.

Q. What was the condition of the river before 1900, the date that the canal was opened?

A. It appeared clear and—well, before 1900?

Q. Before, yes?

A. Well, it had a stench in it; did always at times, except in an extreme flood.

Q. How was the color of the water?

A. Well, at times it was filthy like, and at times it wasn't.

Q. Did you have any cattle on your farm?

A. Yes, sir.

Q. How were they watered?

A. Well, up to 1880, they had to drink out of the river, or out of the canal, at dry times, in the wet times, why, we
6420 had what we call sloughs that we watered from.

Q. Up to 1890, would the cattle drink the water of the Illinois river?

A. Not after I got, in 1880—

Q. Up to 1900, I mean?

A. In 1880, I dug artesian wells and since I have had artesians on the farm, no live critter would touch the water. They would go to the artesian wells to drink ever since, whether the drainage run or not.

Q. Since the opening of the canal have they drank the water of the Illinois river during the last three years?

A. No, sir, not as a rule because I have two or three flowing wells, and they drink from the flowing wells.

Q. You keep them where they can get the well water?

A. Yes, they are kept in pastures so as they can get it.

Q. What has been the effect of the opening of the drainage canal on the Illinois river?

A. Why, the water is, in my judgment, decidedly better than it was before the opening of the drainage canal.

Q. In what way is it better?

A. It don't have the stench that it used to have. From 1866 or 1867 to 1880 I watered my cattle in dry times, and in the winter time, out of the river, and chopped holes in the ice, and don't recollect now of ever chopping holes in the ice—
6421 I have not smelled the water.

Q. Well, since the opening of the drainage canal have you noticed the smell?

A. Well, no, I have not chopped any holes in the ice much. As far as I know, the water is free of that stench.

CROSS-EXAMINATION, by Mr. Jeffries.

Q. Do you drink the water from the river?

A. No, sir.

Q. Do you use it for domestic purposes?

A. Never,—I don't know but that sometimes way back we might have been short of cistern water and drawed some river water to wash in, but I don't know as we did. I don't think we did more than one time anyway.

Q. How often are you on the river?

A. Well, that depends on how thick the ducks was; I was there pretty often or along the river.

Q. But here lately in the last two or three years?

A. Oh, my work was right along the river. I plowed down to the river here and kept a set line and catched fish when I would be plowing.

Q. How is it now?

A. Well, I don't know.

6422 Q. Are you on the river much now?

A. I have not been on the river very much for about seven years; not so much as I was when I lived on the farm, and my work and my business called me to the river.

(F. S. B., Com'r.)

6423 GILBERT HOWLAND, called as a witness in behalf of the defendants, being first duly sworn by the Commissioner, was examined in chief by Judge Johns and testified as follows:

Q. What is your name?

A. Gilbert Howland.

Q. Where do you reside?

A. Here in Marseilles.

Q. How long have you lived here?

A. I have lived here fifteen years or more.

Q. How long have you lived in the vicinity of the Illinois river?

A. Since a boy eight years old.

Q. And that would be about how many years?

A. Well, I am 67 years old.

Q. What was the condition of the Illinois river here before January, 1900, when the drainage canal was opened?

A. I considered it very bad, sir.

Q. Well, in what way?

A. Well, it smelled very bad. I fished a good deal; I didn't have any particular business and I fished a good deal. I have seen down there almost what you might call floating islands, I don't know what you call it, it is a plant or something
6424 that grows on the water; it used to come down and
lay—I have seen it eighteen inches to two feet thick kind of laying on the water there, and decaying there.

Q. Was there an odor from that in the summer?

A. Oh, terrible, sir, bad.

Q. Now, since the opening of the drainage canal what has been the condition of the water?

A. I haven't seen a thing of it since.

Q. You have seen nothing of this scum, of this plant?

A. No, sir, I haven't seen it at all.

Q. Has there been any odor on the water since the opening of the canal?

A. Not to amount to anything.

Q. Prior to the opening of the canal how was the water here in winter?

A. Oh, it was very bad; you could smell it about forty rods if the wind was right, either side of the bridge here, if the wind were blowing.

Q. Now, have you noticed in this river here any different varieties of fish since the opening of the drainage canal?

A. Yes, I have caught them. I have caught lake fish here.

Q. What ones?

6425 A. I think they call them ciscos; they average about a foot long, and I have caught perch,—lake perch, that I never saw in the river before. I caught any amount of them last season here.

Q. How long have you been noticing these lake fish in the river here?

A. Well, I have noticed them the next year after the water was let in.

Q. And they seem to be increasing?

A. I should judge so. There was more last year than there were the year before.

Q. Is it quite common here to catch lake perch and ciscos in the river?

MR. JEFFRIES: Objected to as leading.

A. Yes, I should think it was.

CROSS-EXAMINATION, by Mr. Jeffries.

Q. How often are you on the river now?

A. Oh, pretty much every day.

Q. Did you, or do you use the water from the river for drinking purposes?

A. No, sir.

Q. Do the people in this town use it for that purpose?

A. No, sir; not that I know of; I don't know of any.

6426 Q. You don't know whether the water contains deleterious substances or not, then?

A. No, sir, I don't know anything about that.

Q. You don't know whether the water contains Chicago sewage or not?

A. Well, all I know about it, is what I read, from what I have read, it does; I don't know personally.

Q. There is some odor now, is there not?

A. Very little, sir.

Q. A larger volume of water, though, and a stronger current?

A. Yes, sir.

Q. Very much stronger, isn't it?

A. Yes, the river used to be low, of course.

Q. Well, there is a current now all the time?

A. Yes, sir.

Q. When before the canal was opened, there was times in the year when there was no current ?

A. Oh, no, there wasn't times that there wasn't any current.

Q. Wasn't there times that you know, when the water wouldn't flow over the dam?

A. Well, very short; there might have been.

(F. S. B., Com'r.)

6427 H. W. COLLIER, called as a witness in behalf of the defendants, being first duly sworn by the Commissioner, was examined in chief by Judge Johns and testified as follows:

Q. What is your name?

A. H. W. Collier.

Q. How long have you resided in Marseilles?

A. Why, in Marseilles and vicinity, right around here within a mile and a half since the spring of 1870.

Q. What is your business here?

A. Why, I am running a pool room at present.

Q. Have you ever been engaged in the sprinkling of the streets?

A. Yes, sir, we are now and have been for the last nine years.

Q. Where do you obtain your water for the street sprinkling?

A. Why, with the exception of this year we have been getting it from the canal.

Q. Do you know whether the canal is fed from the Chicago river?

A. Well, they claim it is. I have not been right to the point of its feed; I couldn't say positively as to that, but that is the belief.

6428 Q. Now prior to the opening of the drainage canal, what was the condition of the Illinois river at this point?

A. It was very rotten, so to speak; you could smell it.

Q. In what way?

A. Why, seemingly from refuse; I don't know what else.

Q. In low water did the water run over the dam here?

A. Well there has been—yes, at all times I guess there is a little water run over the dam, if not run over it, run through a little, but nothing to speak of, so that but what you could go two-thirds of the way across the dam without wetting your feet at all, on the cone.

Q. Now did a scum form on the water here before the opening of the drainage canal?

A. Yes sir.

Q. What was the character of it?

A. Well, it was a floating weed; it seemed to be a kind of a slimy gathering; I really don't know what the composition of it was.

Q. Was there an odor in the water in the summer?

A. Yes sir.

Q. How in the winter?

A. Well it seemingly was even worse in the winter; that is when we noticed it more here, especially when it was froze up, on account of the opening, it not being opened all
6429 along, just open at the dam.

Q. It seemed to be worse in the winter?

A. Yes sir.

Q. Now for your sprinkling purposes here, was there an objection to the water before the opening of the drainage canal?

A. Yes sir.

Q. On what account?

A. Well, they claimed that it was so stinking that it wasn't fit to be thrown on the streets.

Q. Now since the opening of the drainage canal what has been the condition?

A. Well, I never have had any trouble; it has been much better. I never have had anyone refuse the water.

Q. Has it been clearer or purer here since the opening of the drainage canal?

A. Yes sir, it certainly has.

Q. Has there been any of this odor in it?

A. Well there has been some yes, but not one-hundredth part of what there was before, I would say.

Q. How has it been in the winter under the ice?

A. Well, it has not been near so bad; we have had some of course.

6430

CROSS-EXAMINATION,

By Mr. Jeffries.

Q. How long do you say you have lived here?

A. Since the spring of 1870.

Q. You don't drink the water from the river?

A. No sir.

Q. About the only purpose that they use it for is down here at the dam is it?

A. Yes sir.

Q. For water power?

A. Yes.

Q. Do you know whether it contains sewage from Chicago or not?

A. I don't—no sir; I have never examined anything of the kind to know anything about where is comes from.

Q. The people here in town don't use it at all?

A. No sir.

F. S. B., Com'r.

6431

J. W. VAN LOON,

called as a witness in behalf of the defendants, being first duly sworn by the Commissioner, was examined in chief by Judge Johns and testified as follows:

Q. What is your name?

A. J. W. Van Loon.

Q. What is your occupation?

A. I am a painter.

Q. How long have you lived in Marseilles?

A. About eleven years.

Q. Have you been much upon the Illinois river here?

A. Yes.

Q. In what way?

A. In fishing.

Q. With a rod or nets?

A. With a rod.

Q. Are there net fishermen here?

A. No sir.

Q. Were there net fishermen here before the opening of the drainage canal?

A. Why, I don't know of any. Not to my knowledge.

6432 Q. Then the business of fishing here in the Illinois river was not an industry; it was not for commercial purposes?

A. No sir.

Q. What was the condition of the Illinois river before the opening of the drainage canal?

A. Oh, I don't know; it was a good deal worse then than it is now. I could say that.

Q. Well, in what respect?

A. Well in warm weather there was quite a stench to the water.

Q. What kind of substances were there in it?

A. Oh, it was just a mass of stuff floating in the water, it looked like a kind of a jelly that gathered along the shore.

Q. And did that stuff produce a stench?

A. Yes sir.

Q. What was the color of the water as compared with it now?

A. Well it was a very dark, oily, greasy color and muddy.

Q. Do you know of any odor in the river during the winter when it was frozen over?

A. Yes sir.

Q. What was it?

A. It was a very bad odor there at the dam, where it was open, where the water run over the dam; we could smell it bad around town here.

6433 Q. Now since the opening of the drainage canal what has been the condition of the water?

A. We don't see so much stink at all; the water seems to be purer.

Q. What is the color of it; has it a better color now?

A. Yes, days here it is just the same as lake water, blue.

Q. Is there any of this floating stuff on the water?

A. Don't see any, no.

Q. Any scum form on the surface?

A. No, don't see any at all.

CROSS-EXAMINATION,

By Mr. Jeffries.

Q. You say you are a painter?

A. Yes.

Q. Spend a good deal of time on the river?

A. Yes, I fish a good deal of the time.

Q. You are not very busy at your business then?

A. Well I fish in the morning and the evening.

Q. Do you drink the water from the river?

A. No sir.

Q. Do you know of anybody that does?

A. No.

Q. You say the filth and slime used to stay along the banks of the river? 6434

A. Yes.

Q. On the rocks?

A. Yes, on the rocks.

Q. The rocks would be covered with it where it would settle on the little pebbles?

A. Yes sir.

Q. Does it do that now?

A. No, I have never seen it.

Q. Well, you would have seen it if it did, wouldn't you?

A. Certainly.

Q. What becomes of it?

A. I don't know—I couldn't tell you that.

Q. It is washed away, isn't it?

A. I couldn't tell you that.

Q. Well it isn't there?

A. It isn't there; it is not like it was.

Q. Well there is a larger volume of water and a stronger current now, isn't there?

A. Oh yes.

Q. When at times before the opening of the canal where this scum formed on the water, there was no current to amount to anything?

6435 A. Well there is always a current in the river.

Q. No current to amount to anything though—it was very sluggish, wasn't it?

A. Well it was a great deal more sluggish then than it is now. I noticed it this morning; it runs very slow.

Q. Do you mean to say that the current is not any faster now than it was before the canal was opened?

A. Well here above the dam, I am speaking. Below the dam it is always rapid along there.

Q. Well I am not speaking of above the dam; I mean any place.

A. Yes sir.

Q. A green scum formed before the canal was opened, but it don't form now?

A. No sir, and the water today is traveling much faster than it was then; when the mills was open, during the summer, low water, we had no water run over the dam; all the current it got in it was the water that passed through the mill.

Q. So you have got a better current now?

A. At certain times, yes, according to the stage of the water.

Q. What do you know about the water in the Illinois river for drinking purposes?

6436 A. I don't know anything about it.

Q. Do you know whether it contains as much filth as it did before the opening of the canal?

A. Well, I couldn't say that.

Q. Well, if the sewage from Chicago got down here from the old Illinois and Michigan Canal, why wouldn't it come from the other canal?

A. I couldn't say as to that.

Q. In other words, you don't know anything about it?

A. I know about the condition of the water, the smell of it and the slimy stuff, like that.

Q. And that is all you do know?

A. Yes.

F. S. B., Com'r.

Whereupon an adjournment was taken until 1:00 P. M., same day, Tuesday, August 18th, 1903, at Morris, Illinois.

6437 Morris, Illinois, Tuesday, August 18th, 1903. 1:00 P. M.

Continuation pursuant to adjournment. Present, the Commissioner and same counsel representing the respective parties.

HENRY COOPER,

called as a witness in behalf of the defendants, being first duly sworn by the Commissioner, was examined in chief by Judge Johns and testified as follows:

Q. What is your name?

A. Henry Cooper.

Q. What is your residence?

A. Morris, Illinois.

Q. What is your occupation?

A. Harness business.

Q. How long have you lived in Morris?

A. I came here in 1866,—a little more than 37 years.

Q. How far is Morris from Marseilles?

A. Why, I don't remember it exactly. If I should guess at it, something like 35 miles, I don't know.

Q. Do you know where the Desplaines and Kankakee Rivers join?

6438 A. Yes sir.

Q. How far is it from here?

A. That is about—well we call it nine or ten miles.

Q. By river?

A. Yes sir.

Q. After the junction of those two rivers is the river called the Illinois river?

A. That is what we call it.

Q. Have you been acquainted with the Illinois river between here and the junction of the two rivers forming it since you have lived in this community?

A. Yes sir.

Q. Through what means did you become acquainted with it?

A. Well, when we would go fishing, we always rowed a boat from here up the river all the way. We used to go up here in boats and stay all night, fishing.

Q. Now did you fish in this river prior to 1885, when the sewage from Chicago was pumped into the Illinois and Michigan canal?

A. Did I live here then?

Q. Yes.

A. Oh yes.

Q. Dd you fish in this river here at that time, and below?

6439 A. Yes, I didn't below; I did above.

Q. Now prior to that time what was the condition of the Illinois river before the sewage was pumped into the Illinois and Michigan Canal?

A. Why, I didn't see anything wrong with the river. We used to catch lots of fine fish there, but we found the river was getting polluted, and we understood, I think, that they was pumping this sewage in,—well then it stayed on the side of the Desplaines, on the north side of this river.

Q. Of the Illinois?

A. Yes, and from one-third to half way across the river would be what we called spotted, and we would go on the south side sometimes and catch fish, until it finally got so bad we could not catch them at all, for we couldn't stand it anyway, it smelled so bad, and they told me it was the sewage that was pumped into the Chicago river and of course from what I read and what I have heard, I supposed that it was.

MR. JEFFRIES: I move to strike out what the witness has been told on this subject; also what he has read.

Q. Now after this sewage was pumped in, you may state whether or not in this upper stretch of the river the fish disappeared?

A. Well they did after that, yes, after it became so bad
6440 here we couldn't catch any fish at all; couldn't get any,
and we saw lots of dead ones; they would be dead all along the shores of course, even catfish and bull-heads, and we knew when the water got so bad that catfish and bull-heads couldn't live in it, it was pretty bad.

Q. What was the matter with it?

A. Why the sewage, slime and stuff that came in.

Q. Did it create an odor in the water here?

A. Well, I should say so.

Q. In the summer?

A. Yes, sometimes when the wind was from the south, especially evenings,—I knew it was the river because I knew it was the same smell I got when I was up the river; it was the same smell exactly.

Q. What kind of a smell was that; can you describe it?

A. Well, it was a strong smell. I have often wished I could describe it; it is a smell that I can't describe, I don't believe.

Q. Now did that condition of affairs continue up to 1900, when the drainage canal was opened?

A. Yes sir, it did.

Q. How was the water in the winter here, under the ice?

A. Well, I don't know about that; I never was on the
6441 river here in the winter.

Q. You don't know whether if a break came, or there was a hole cut in the ice there was stench came up?

A. Not of my own knowledge; I have heard them say so, but I don't know that.

Q. Now after the drainage canal was opened, what was the condition of the river here?

A. Why, soon after it begun to get better, and we thought the water looked since that, as like as though it was about as clear and as good as it used to be before, but I have not tried to fish in it since that. Of course I know from what I hear they are catching fish in the river now, but I haven't tried to fish in the river because I got disgusted with it at that time and quit.

Q. What kind of a water system have you here,— a public water system?

A. Yes sir.

Q. From what source is the water obtained?

A. From wells,—artesian wells, I believe they call it.

Q. Have you a sewerage system?

A. Yes sir.

Q. How much sewer is in the town by miles?

A. Well, it ain't all sewered. That has only just
6442 recently been done; that is about a year. There is one
large sewer runs down the Main Street and some little branches from it, and that's all.

Q. But that is recent?

A. Yes, recent; just about a year.

Q. And such sewage as empties into that goes into the Illinois river?

A. Yes sir.

Q. Are there privy vaults in the town?

A. Oh yes.

Q. Is there a sytem here of cleaning them?

A. They have had scavenger work done of that kind I believe; I know they have.

Q. Do you know where the deposits from the privy vaults are made, when they are cleaned?

A. No sir, I do not.

Q. Is the water used here now from the Illinois river in manufacturing establishments?

A. I don't think it is.

Q. What manufacturing establishments have you in the town?

A. There is what you call the Coleman works and the tannery and the Nickel Works up here, similar to the Coleman works, and paper mill and so on.

6443 Q. How many paper mills in the town?

A. Only one.

Q. Is it straw-board or is it wood pulp?

A. Straw.

Q. Since the opening of the drainage canal you have seen the water in the Illinois river and seen the river?

A. Yes sir, I have been on it.

Q. Now how much better is it than before the opening of the drainage canal?

A. Oh, I think about five hundred or a thousand per cent, something along there. It looks good to me, and it wasn't fit to be seen before.

CROSS-EXAMINATION,

By Mr. Jeffries.

Q. They don't use it for domestic and drinking purposes here in town, do they?

A. No sir.

Q. Do you ever drink it?

A. No sir.

Q. When you say it is better than it was before the canal was opened, you get your information from simply observing the water?

6444 A. Yes, from looking at it, and I can see the fish in it, and before they couldn't live in it; it was so slimy then that you couldn't see in it hardly.

Q. Now then before there was no current to amount to anything?

A. Well I don't think there was as much as there is now.

Q. Well at times in the year there was practically no current?

A. Oh yes, there was always some current in the river in some places where it runs quite fast.

Q. Well it was very shallow there?

A. Yes, it was pretty shallow.

Q. It was so shallow and the current was so sluggish that it deposited this stuff along the banks, did it?

A. Yes sir, it deposited it along the banks and of course right in where the water ran you could see it on the water.

Q. None of that obtains now?

A. I have never seen anything of the kind now.

Q. How often do you visit the river?

A. Oh, once a week perhaps.

Q. You say you don't fish in the river?

A. I have not fished in it since that time.

Q. That was years ago?

A. Yes, that is a few years ago. I guess I will try it again; I see the rest of them are all catching fish now.

6445 Q. Are there any places in town along the river here in this locality that use the water of the river?

A. Well sir, I don't think there is; I don't think so; I don't know.

Q. How many people are there in this town?

A. I think they call it about 5,000.

Q. Now the sewers that are constructed in the town are in the business part of the town, aren't they?

A. Yes sir.

Q. What per cent of the town is sewered, according to the population, twenty-five or thirty per cent of it?

A. Well about, I should think 25 per cent, to guess at it. I haven't thought about it.

Q. Now how far is the town from the river?

A. Well from where we sit now, to the river, I don't think it is a quarter of a mile; something like that, may be.

Q. The Illinois and Michigan Canal is between the town and the river, is it not?

A. Yes sir.

Q. Now with reference to the construction of the sewer, does it pass under the canal?

A. Yes sir.

6446 Q. And the surface water that runs from the town, where does it go to?

A. Well, if it runs that way, I presume it runs into the canal.

Q. But not into the river?

A. Oh, no.

(F. S. B., Com'r).

6447 H. M. FERGUSON,

called as a witness in behalf of the defendants, being first duly sworn by the Commissioner, was examined in chief by Judge Johns and testified as follows:

Q. What is your name, residence and occupation?

A. H. M. Ferguson, Morris, Illinois, physician.

Q. In what county in Illinois is Morris?

A. Grundy.

Q. Is it the county seat?

A. Yes sir.

Q. Is it an organized city under our general corporation act?

A. Yes sir.

Q. Has it a Board of Health or a health officer?

A. Yes sir.

Q. What is the name of the—or the official style of the health officer?

A. Executive officer.

Q. Have they a board of health here?

A. Yes sir.

Q. Now have you occupied any position in this board of health?

A. Yes sir.

Q. What was it?

6448 A. I was Executive Officer, health physician.

Q. When were you in this position?

A. Up until this last year, I served three, possibly four years.

Q. When did your term expire?

A. Last Spring.

Q. After the municipal elections?

A. Yes sir.

Q. You were then the health officer both before and after the opening of the drainage canal in 1900?

A. Yes sir, that would make it.

Q. Now what system of public water supply is there in this town, if any?

A. Artesian water.

Q. What is the depth of the wells?

A. The depth of the city supply?

Q. Yes.

A. I will say approximately about 900 feet; but that is only approximately, it has slipped my mind.

Q. How extensively in the town is the public water supply used?

A. Largely.

Q. What portion of the population take their water from the public water supply?

6449 A. The large bulk.

Q. Well, seventy or eighty per cent?

A. I would say fully that.

Q. From what source do the other people in the town obtain their water?

A. Well, the practice is almost universally taking city water. On the outskirts there is occasionally a well, and possibly one or two wells in the town that are being used.

Q. Are there any cisterns?

A. For drinking purposes?

Q. For drinking purposes?

A. I don't know of any families that drink cistern water.

Q. Is there a system here of reporting the statistics as to deaths from diseases, to any officer?

A. Yes sir.

Q. To whom?

A. It is reported to the City Clerk, but that is this last year only.

Q. Never before?

A. Not systematically.

Q. Do you mean by that that it has not been done regularly and carefully so that the statistics as to deaths would be reliable?

A. Yes sir, that would be what I would say. We tried
6450 to get the statistics before, to make report to the board.
Our mortality here is a little less than fourteen per thousand.

Q. Do you know with reference to the prevalence or existence here prior to January, 1900, of typhoid fever?

A. Formerly typhoid was very prevalent; now it is excellent, practically none except imported cases.

Q. You mean now there is scarcely any except imported cases?

A. Yes sir.

Q. Now since the opening of the drainage canal, what has been the condition of the people here as to typhoid fever?

A. We have had no typhoid fever practically except it is imported. I have noticed that and discussed it with other physicians only last night.

Q. Are you familiar with the manufacturing interests here, and their character?

A. Yes sir.

Q. What are they?

A. We have got a paper mill; we have got a foundry; we have a tannery; we have a large machine shop and we have an oat-meal mill and the usual small shops.

Q. What kind of a paper is made here, from straw or wood pulp?

A. Straw.

Q. Do you know into what it discharges its refuse water, into the canal or the river?

6451 A. I don't know positively, but I have understood it was into the river. This mill has been working very irregularly for it was idle for a long period, the paper mill.

Q. When was it in operation last?

A. It is in operation now. I can't give you accurate figures regarding that, but I think it has only been the last two or three years that it has been in operation.

Q. What is the extent of the tannery?

A. It is quite a tannery.

Q. The refuse from the tannery; do you know where it goes?

A. It empties below the bridge into the river.

Q. What amount of public sewers are there in the town?

A. Well, we have just inaugurated the sewerage system; the city has been surveyed of course, and we have two main outlets, one in the river and one in the Nettle Creek that empties below the river, or below the bridge.

Q. Does that mean below the city?

A. Yes sir.

Q. What is the extent of the Nettle Creek?

A. Well, there is always some water in it, but in midsummer it gets pretty low.

Q. Which direction from the city does it run?

A. It runs through the west side of the city, and parallel to the western boundary.

6452 Q. How long a creek is it?

A. Oh, I understand that its source is up in Wisconsin, from hearsay.

Q. So that it drains quite an extensive country?

A. Yes, during freshets, with a large amount of water.

Q. Now what was the condition of the Illinois river here before the opening of the drainage canal?

A. Bad.

Q. In what respect?

A. It was murky, ill-smelling, and dead, rotten.

Q. Was there an odor here to the water in the summer?

A. We could smell it here in town.

Q. How far is the business part of Morris from the river?

A. About a quarter of a mile away, and about an elevation of thirty or forty feet.

Q. Above the level of the river?

A. Yes sir. Those are approximate figures; I don't know for certain.

Q. Do you know whether there was a considerable growth of plant life in the river prior to the opening of the drainage canal?

A. Yes sir.

Q. Was there a scum upon the river?

A. Yes sir.

6453 Q. Of what character?

A. Why, I didn't examine it especially, a vegetable growth, a rank growth, I would describe it.

Q. Do you know the form of the plant life that appeared on the surface, whether it was a small plant, very small with three leaves and a very small root, three little sprangles of the root?

MR. JEFFRIES: Objected to as leading and suggestive.

A. I am familiar with one type only and that I could describe very accurately. It is probably a quarter of an inch across, shaped something like a clover leaf, and it had several little tendrils extending down into the water, and this would become matted and would grow in masses.

Q. Do you know by what name that plant was called here?

A. No sir.

Q. Duckweed, shamrock, or water clover?

A. Water clover seems familiar. I never had it—I don't know—but I picked it up out of the water and examined it.

Q. In addition to this plant life, was there a foreign substance appeared on the water here, grease or oil or something not connected with the plants?

A. Why I never noticed that specifically except that the whole body of water was bordering on putrid.

6454 Q. What was the character of plant that grew from the bottom of the river, moss or grass?

A. Well, I would hardly know how to differentiate those two. My recollection is that it would grow like seaweed, you would pull it up on an oar and it would mat down very heavy, and it would grow right close together, but the form of leaf I never noticed particularly. Sometimes they would have almost microscopic spikes running off from the side and that is as definite as I could give that.

Q. Did you notice the condition of the water here in the winter prior to the opening of the drainage canal?

A. Yes sir, by reputation and by casual observance.

Q. What was its condition then?

A. Bad.

Q. Was there a smell or an odor from it here in the winter?

A. I don't recollect that.

Q. Now since the opening of the drainage canal what has been the condition here?

A. Better.

Q. In what respect?

A. Well in all of the objectionable respects, the water is clearer, that is after the period of washing, after the water was first turned in, it was worse, but after that it cleared up; there was less odor apparently, less solids in suspension, 6455 and you could see the bottom more.

Q. Clearer you mean by that?

A. Yes sir.

Q. And better current?

A. Oh yes, the current is much better.

Q. What was the current here before the opening of the drainage canal?

A. Oh, it was sluggish.

Q. There was always some current?

A. Yes, there was some current but not very much.

Q. Now do you consider the water since the opening of the drainage canal better water than before?

MR. JEFFRIES: Objected to as leading.

A. Oh yes, decidedly so.

Q. Now did you take samples of water here for any person, either before or since the opening of the drainage canal?

A. Yes.

Q. For whom?

A. State Board of Health.

Q. In what years did you take the samples?

A. I think it was 1899 and 1900; I am not sure; I think that was the year; I have a memorandum at the office that I could refer to.

6456 Q. Were you instructed to take the samples?

A. Yes.

Q. By whom?

A. Dr. Long and Mr. Harman.

Q. They were together here?

A. Yes.

Q. Now at what point in the river did you take the samples?

A. About 50 or 100 feet above the railroad bridge.

Q. Is that above any of the sewage influences of the city of Morris?

A. Practically so; I went down to the bridge with them and viewed it, and it was agreed that it was a good place.

Q. At what point in the channel did you take it, middle or in the channel?

A. A little this side of the middle—middle of the center pier.

Q. In what way did you take it?

A. According to instructions.

Q. Well but at what depth?

A. Well the small bottle, or sample, for bacteriological examination—well both samples for that matter, I took as far down as my arms would reach, about here (indicating) oh twelve or fifteen inches.

Q. How frequently did you take the samples?

6457 A. My recollection is once a week.

Q. During what season of the year of each of the years, summer or winter?

A. Why, as I remember, I took them at all seasons. I remember cutting through the ice and I remember going in mid-summer.

Q. Now when you took the sample of water did you have a thermometer?

A. Yes sir.

Q. What did you observe upon the thermometer?

A. Observe in what way?

Q. What temperatures did you take with the thermometer?

A. I took the temperature of the water and of the atmosphere.

Q. Now did you record upon tags furnished to you the time and place of collection and the temperature of the air and the water?

A. Yes sir.

Q. And did you sometimes record other facts as to the condition of the river or showers, or anything of that sort, upon these tickets?

A. Yes I think I did. I replied in answer to Dr. Long, in reply to questions as I recollect it, commenting on the better condition of the water. I was interested in the work, 6458 being a physician and bacteriologist myself.

Q. From whom did you receive the bottles?

A. The express company.

Q. And to whom did you return them after they were filled?

A. The express company.

Q. Describe the bottles and their covering and the manner of taking the sample and preparing it?

A. The samples were taken in duplicate; there was a glass stoppered, clean bottle, sealed and steriled and an either four or six ounce—four, six or eight ounce, I don't recollect just the dimensions of it, a practically six or eight ounce glass stoppered and also sealed with a rubber cloth around it and tied.

Q. Now how did you take the sample in the smaller bottle, as to whether you opened the bottle before you put it into the water or after?

A. I took the water—that is, I took the seal off the bottle and closed the bottle under the surface twelve or fifteen inches, or as far down as it would get away from the surface drift.

Q. And then remove the stopper under the water?

A. Yes sir.

Q. And after the bottle was filled what did you do with the stopper?

6459 A. Well, I put the stopper into the bottle under the water.

Q. After it came up what did you do with this smaller bottle?

A. Why, I drove immediately to my office, sealed it and packed in ice and delivered it to the express company and sent it away that morning.

Q. Now with the larger bottle, what was the manner of treating it?

A. Well I sealed that and attached the envelope with the address on and the descriptive ticket under seal.

Q. How long from the time that you took the samples of water until they were delivered to the express company?

A. Well there was no delay from beginning to end. I went to the river, to my office and to the express company. I would say that I would start out at half-past eight and the express company would have them within an hour.

Q. Well, would it be thirty minutes from the time that you took the samples until you delivered them to the express company?

A. No, I couldn't possibly do it that quick, the work was completed while I was doing it—I took it to the office and sealed it and got it under the ice as quick as I could.

Q. The smaller bottle, was it enclosed in a larger case?

A. Yes sir.

6460 Q. And what was put in the larger case?

A. Ice.

Q. Do you remember whether in the box into which the two bottles were put you put ice outside of both bottles, both cases?

A. I don't recollect of icing the big bottle.

Q. I now hand you forty-two tickets and ask you to examine them and state whether or not the writing upon them is in your hand, or done under your direction?

A. Yes sir, those are mine.

Q. Now when these tickets were prepared as they appear, state what you did with them?

A. I enclosed them in a shipping envelope and sealed them.

Q. And what became of the envelope, was it attached to one of the bottles?

A. It was attached to the large bottles with sealing wax and string.

Q. Did you have a stamp which was placed on the wax?

A. Yes sir.

Q. Do you remember your number?

A. Three, I think it was.

JUDGE JOHNS: I now hand the Commissioner forty-two tickets, referred to by the witness and ask him to mark them Exhibit No. 16 for the State of Illinois for identification, to the testimony of H. M. Ferguson. 6461

Said tickets are so marked by the Commissioner.

CROSS-EXAMINATION,

By Mr. Jeffries.

Q. When did you say you took those samples, doctor?

A. In the morning.

Q. What year?

A. My recollection is in 1899 and 1900.

Q. What part of the year in 1899?

A. I can't say definitely.

Q. In the summer or winter?

A. Well that is four years ago; I don't care to state definitely without referring to my ledger.

Q. Did you take them in 1900 also?

A. I think I did.

Q. So you took samples during a part of two years?

A. Yes sir.

Q. But it was all one continuous duration of time, or was there a cessation?

A. No, I think it was irregular; that is when I was taking them I took them regularly, and then there would be an interval, or was an interval.

6462 Q. Did anybody assist you in this work?

A. No sir.

Q. How often did you take the samples?

A. My recollection is once a week.

Q. And who did you send them to?

A. To Dr. Long. The printed directions were on the ticket; I have forgotten whether it was sent to the University, but it was delivered to Long.

Q. How long have you been practicing medicine?

A. Thirteen years.

Q. What school of medicine do you belong to?

A. The regular.

Q. You stated, I believe that you were a bacteriologist yourself?

A. Oh yes, I have done quite a little of that work.

Q. Does your knowledge of bacteriology influence you in your opinion as to the condition of the water now and what it was prior to the opening of the canal?

A. I made no bacteriological examinations of it at all.

Q. You don't know what that shows?

A. No sir.

Q. Whether it is good or bad?

A. Why, I glanced over the report of the State Board and noticed.

Q. I am not talking about that; I am talking about 6463 from your own knowledge?

A. No, not from my own knowledge, I don't know.

Q. Did that have anything to do with you in expressing an opinion as to the condition of the water?

A. No sir.

Q. You just judged from its appearance?

A. Yes sir.

Q. Without having made any examinations whatever?

A. Yes sir.

Q. Either chemical or bacteriological?

A. Yes sir.

Q. And the fact that it has been examined, or your knowledge of the science of bacteriology and as a physician, had nothing to do with your forming an opinion on that subject?

A. My opinion is formed only on the microscopical condition that I found there, noticing it casually in collecting the samples.

Q. Did you take microscopical observations yourself?

A. No, I say the microscopical, that is the gross condition of it.

Q. Or from ocular observation?

A. Yes, sir.

Q. The river was very sluggish before the canal was opened, was it not, doctor?

6464 A. Yes, sir.

Q. And as a consequence it deposited this decayed vegetation and matter along the banks and held it in the body of the water, and permitted its going down the river?

A. I wasn't familiar with that condition, no; I never noticed it in fishing or anything of that kind.

Q. Was there any decayed vegetation along the river at that time?

A. At what time do you refer to?

Q. Prior to the opening of the canal, either winter or summer?

A. Well, I would say Yes and No to that question. There would be this shore wash, and this little clover leaf growth that I referred to.

Q. Is that shore wash there now?

A. No, sir.

Q. It has all gone?

A. So far as I know, yes.

Q. How often do you visit the river now?

A. Oh, I have been across the river on a boat twice, but I have been across on the bridge often, practicing and always noticed the water as I go by.

Q. What is the difference in the current now to what
6465 it was before the opening of the canal?

A. Well, the current is much stronger so that in boating you have to take it into consideration.

Q. The people in Morris and vicinity do not use the water of the Illinois river for drinking or domestic purposes, do they?

A. Oh, no, we have no system of getting it at all.

Q. Do they use the water from the Illinois and Michigan canal?

A. For commercial purposes?

Q. For drinking and domestic purposes?

A. No, just for mercantile work.

Q. Did they ever use the water from the Illinois and Michigan canal previous to this at any time for drinking and domestic purposes?

A. No, our well supply has always been pretty good.

Q. What was the cause of the typhoid fever several years ago, that you spoke of; you said there was more then than there is now.

A. Well, all through the country here there was shallow surface wells, and it got to be a fashion twelve or fifteen years ago to put down pipe wells, and then this strata of sand here down the river—the drainage gathered, and the cause of the typhoid fever was defective drainage on the prairie.

Q. Not due to anything connected with the Illinois river?

A. I don't know anything about that.

6466 Q. Well, what would be your judgment about it?

A. Whether the condition of the river produced typhoid or not?

Q. By reason of their drinking the water from the river?

A. I think it had an effect in view of the mosquitoes; we used to have an immense amount of them there, but the town and surrounding country is higher than the river, but the mosquitoes explained that.

Q. Well, then, it was not due to the inferior wells that they had?

A. Well, the well entered into the proposition, I know. Years ago we had an immense amount of typhoid fever.

Q. When did the condition commence to abate?

A. It commenced to abate—

Q. As soon as these wells were being sunk?

A. Typhoid fever, when I looked over the records—my recollection is that the typhoid fever wave dropped about the time that the city waterworks were instituted.

Q. When was that?

A. I couldn't say, it is five or six or seven years ago.

Q. About when, 1887, 1897 or 1895?

A. Well, let's see; call it eight years ago.

Q. Eight years ago?

A. Yes, sir.

6467 Q. How large a water system have they; what is the capacity of the water system here—sufficient to furnish water to all who want it?

A. Oh, yes, abundant.

Q. The source of the water is beneath the bed of the river is it not?

A. I think so.

Q. Does it come from the direction of the river, or from the opposite direction, if you know?

A. I only know by hearsay, as I understand, the strata drifts from the northeast.

Q. Towards the river?

A. Down through here (indicating).

(F. S. B., Com'r.)

6468 DEWITT C. HUSTON, called as a witness in behalf of the defendants, being first duly sworn by the Commissioner, was examined in chief by Judge Johns and testified as follows:

Q. What is your name?

A. DeWitt C. Huston.

Q. Where is your residence and what is your occupation?

A. Morris, Illinois; I am in the grocery business.

Q. Do you occupy any official position here?

A. I am just at present on the board of review.

Q. That is the board reviewing the system of taxes?

A. Yes.

Q. Are you appointed or were you a member of the board of supervisors?

A. No, sir, I was appointed.

Q. By the county judge?

A. Yes, sir.

Q. How long have you lived in Morris?

A. Well, continuous residence since 1874. I did live here awhile in 1855 and 1856.

Q. Have you been acquainted with the Illinois river for a considerable number of years prior to the opening of the drainage canal in January, 1900?

6469 A. Yes, sir.

Q. Through what means did you become acquainted with it?

A. Oh, passing over it.

Q. Did you fish or hunt much?

A. Well, not such a great deal; some.

Q. Prior to the opening of the drainage canal what was the condition of the Illinois river at this point?

A. Very bad, the water was.

Q. In what respect?

A. Well, it smelled bad and looked bad and dirty and nasty.

Q. What was its condition in the summer here as to its being covered over with any substance?

A. It used to be covered over with green scum along the edges, excepting in the middle; of course it was washed out. I have seen places where it was clear across the river.

Q. Was there an odor to the water in the summer?

A. Yes, sir.

Q. Can you describe that odor?

A. I know it was very disagreeable; I don't know as I could tell just exactly what it was.

Q. How about the water in the winter?

A. That I don't know anything about; I never was on the river in the winter to take any notice to that.

6470 Q. Do they take ice from the Illinois river here in the winter?

A. No, sir, not for use.

Q. Not for domestic purposes?

A. No, sir.

Q. Where is the ice supply obtained?

A. Well, they get it from the canal and they used to get it from the Mazon creek that comes into the river here opposite the city here.

Q. That is a different stream from Nettle creek?

A. Yes, Nettle creek is on this side of the river.

Q. And Mazon on the other?

A. Yes.

Q. How long a creek or river is the Mazon?

A. Oh, it is,—I should think it would be forty miles.

Q. Is it always full of water?

A. Yes, sir, most always; but towards the head of the creek it dries up.

Q. In dry weather is it a creek or a river of any considerable size?

A. Oh, it is pretty fair sized for a few miles along here.

Q. Now, since the opening of the drainage canal what has been the condition of the Illinois river?

A. It has been a great deal better.

6471 Q. Well, in what respects?

A. The water is clearer, and the water don't have that bad odor to it, it used to have; it don't scum over like it used to.

Q. Is there none of that green scum forming here now?

A. I never see any of it now, no, sir.

Q. Do you know anything about the condition as to the fish in the river here?

A. I know a few years ago we used to catch a good many fish, and late years there has been none at all; couldn't get any.

Q. What do you mean by a few years ago?

A. Well, I say twelve or fifteen years ago.

Q. Do you know of a time when the city of Chicago pumped this water from the Chicago river into the Illinois and Michigan canal?

A. Yes, sir.

Q. Now, with reference to that time when was the fishing good here—before or after?

A. Well, I don't know when that was, of course,—when that pumping started.

Q. It started in 1885.

A. Well, that is about the time the fishing quit.

MR. JEFFRIES: I object to the testimony of counsel here.

Q. Now, do you know anything of the fishing conditions here since the opening of the drainage canal?

6472 A. I understand—I have not fished any myself in the river, but I understand they are catching quite a few fish in the river here.

Q. Is fishing pursued here as a commercial enterprise, for profit?

A. No, sir, not to any extent.

Q. By nets or seines?

A. No, sir.

Q. You have no professional fishermen here?

A. No, sir.

CROSS-EXAMINATION, by Mr. Jeffries.

Q. The water in the summer time prior to the opening of the Chicago drainage canal was very sluggish, was it not?

A. Oh, it would be in low water.

Q. Scarcely any current at all?

A. There wouldn't be very much, no.

Q. How is it since the opening of the canal?

A. Great deal stronger current.

Q. You don't drink the water from the Illinois river, do you?

A. Not when I can help it.

6473 Q. Do you know of anybody that uses it for domestic purposes?

A. No, sir.

Q. Its reputation is rather bad, isn't it?

A. Yes, sir; of course, a fellow could drink it now, if he was forced to, but, of course, as long as you can get better water, you wouldn't drink that.

Q. When you say the water is better than it was before the Chicago drainage canal was opened, you say so simply from your observation of it?

A. Yes, sir.

Q. Without any scientific knowledge as to whether it contains unwholesome ingredients or not?

A. No, sir, just from my own observation.

Q. That observation then is that it don't contain any contaminating matter at all?

A. Well, that,—I don't know about that. I know the water looks clearer a good deal.

Q. Is it your idea that all clear water is pure water?

A. Of course, it looks purer.

Q. Well, you don't want to be saying unqualifiedly that the water is purer now than it was before the canal was opened?

6474 A. Well, I think it is purer.

Q. Judging from its looks?

A. Yes, sir.

(F. S. B., Com'r.)

6475 L. B. RAY, called as a witness in behalf of the defendants, being first duly sworn by the Commissioner, was examined in chief by Judge Johns and testified as follows:

Q. You may state your name, residence and occupation?

A. My name is L. B. Ray; my residence is Morris, Illinois, and my occupation—I am without any; I will say retired.

Q. Have you occupied any official position in the state or in Grundy county, if so, what?

A. Well, I have been a member of the Legislature, both houses, and have been lieutenant-governor of the state four years.

Q. How long have you lived in Morris?

A. Since 1855.

Q. Were you acquainted with the condition of the Illinois river at and above Morris prior to the opening of the drainage canal in January, 1900?

A. Well, only in a very general way. I have never boated on the river at all; I have never fished in the river and never made any examination. I have noticed it as I would go across the river, and know more about the condition from hearsay or talk with the people here, than from personal observation.

6476 Q. Where is the head and origin of the Illinois river?

A. It is about eight or ten miles east of here in this county, in the eastern edge of this county.

Q. What creates it there?

A. The Kankakee and Desplaines rivers come together there and make the Illinois river, the DuPage going into the Desplaines just above the junction of the Desplaines and the Kankakee.

Q. Now, do you know of a stream called the Mazon?

A. Oh, yes.

Q. On some of the maps it is put down as Mazon river, and others as Mazon creek—what is it designated here?

A. We have always called it Mazon creek.

Q. What country does that creek drain?

A. Well, it drains, I think, the northern part of Livingston and the south part of Grundy. I think it gets its head from near Dwight, I think it is; I may be mistaken as to that, and then it goes east and at Gardner the railroad crosses it. There is a place there just east of Gardner called Mazon, and it is quite a river there, quite a creek, and from there it comes in an indirect course down to the Illinois here, at the bridge.

Q. What is the length of this Mazon?

A. As it runs?

6477 Q. Yes?

A. Oh, I would hate to guess; it runs a good many miles going a little ways; some places it is a very crooked stream, particularly when it comes down to the bluff on the south side of the river.

Q. What is the extent of DuPage river?

A. That is quite an extensive river with its source up in Wisconsin, I don't know just where.

Q. Is the Desplaines river, before its junction with the Kankakee, ever called in this vicinity the Illinois?

A. No, sir.

Q. It is distinctly recognized as the Desplaines river?

A. Oh, yes, as the Desplaines river.

Q. And that comes down from Joliet?

A. It comes down through Joliet and Desplaines, and as I said, forms a junction with the Kankakee in the eastern edge of our county, perhaps eight miles east of here.

Q. Now, according to your observation, what was the condition of the Illinois river here before the opening of the drainage canal?

A. Well, in the dry season for the last several years the condition of the water has not been good; it has been bad.

Q. In what way?

6478 A. Oh, well, I don't know that I could give you a scientific answer to that.

Q. Well, have you noticed that there has been vegetation in it, and a scum upon the water in the summer?

MR. JEFFRIES: Objected to as leading.

A. Well, I never noticed that.

Q. Have you ever noticed here an odor coming from the river here in the summer?

A. Well, there has been times here that you could be in the town here and get an odor here, which I suppose was from the river.

Q. And in the winter, have you had any effects from that, or have you noticed it at all?

A. Well, I have noticed that the river has been frozen over, that is, years ago, driving on the river in the winter, when we came to an air-hole it would be vile,—the odor from the river would, in the winter particularly; I never paid any attention to it.

Q. Now, since the opening of the drainage canal what has been the condition of the river?

A. Well, I think the condition of the water has been improved.

Q. Is there a considerable greater volume of water?

6479 A. Or,—if they are not putting in what the law requires them to—they have got four or five feet more here in the bed of the river within a few rods from here—here at the bridge. Engineers tell me that if they are sending down what the law requires it will make a difference of four to five feet at this bridge; that in the dry season makes a great deal of difference; in the flood season like we had most of last year, why, it wouldn't count for so much.

Q. Now, in the flood season the Illinois river is a considerable body of water here, is it not?

A. Yes, sir.

Q. And is it subject here to sudden rises because of the confluence of these various creeks and rivers?

A. Oh, of course they all contribute. Its sudden raise is occasioned in the spring by the melting of the large body of snow; in the summer by heavy rains, the same as any other valley.

Q. Do you know this creek called Nettle creek?

A. Yes, sir.

Q. What is the extent of it?

A. Well, I don't know, it runs up through the northwest part of our county—how much further than that I don't know. In dry season at the present time there is very little water in
it, but in flood season here it may be very large, because
6480 the river takes it. It empties into the river just below
the town here, and that drains the western part of the town of course into the river.

CROSS-EXAMINATION, by Mr. Jeffries.

Q. What has been your business before you were lieutenant-governor?

A. I was in the dry goods business here.

Q. The odor prior to the opening of the Chicago drainage canal was not so bad as to cause anybody to leave the town, was it?

A. No, I don't think so.

Q. What is the difference between the current in the river now and what it was prior to the opening of the canal?

A. Oh, I couldn't tell that.

Q. Could you approximate it?

A. *No, I never paid attention so as to say*; I was never on the river in a boat.

Q. How often do you visit the river?

A. Oh, very seldom.

Q. How far is the river from here?

A. Oh, it is forty rods, perhaps, it may be a little more 6481 or less, I very seldom go there.

Q. The people don't use the water?

A. Never have; we have got an excellent system of waterworks here and a partial system of sewerage.

Q. Then when you say the water has improved, you simply speak from your observation?

A. General observation.

(F. S. B., Com'r.)

6482 CHARLES D. FERGUSON, called as a witness in behalf of the defendants, being first duly sworn by the Commissioner, was examined in chief by Mr. Todd and testified as follows:

Q. What is your name?

A. Charles D. Ferguson.

Q. What is your business?

A. Blacksmith.

Q. How long have you lived in Morris, Illinois?

A. Nearly all the time since 1854.

Q. Were you acquainted with the Illinois river prior to the opening of the drainage canal in 1900?

A. I was.

Q. What opportunities have you had of becoming acquainted with the Illinois river?

A. Well, I used to fish a good deal for amusement, and our fishing club was about a mile up here; we used to row up the river and go up to the four-mile slough above Mazon.

Q. What was the condition of the Illinois river before the opening of the drainage canal in 1900?

A. Well, we called it bad. I did.

Q. What do you mean by bad?

6483 A. Why, it was very black and smelled very bad.

Q. You are pretty well acquainted with the county here, are you not?

A. Yes, sir.

Q. Have you ever held any official position in Grundy?

A. I was sheriff six years.

Q. What extent of the river were you acquainted with?

A. Well, I have been from the mouth of the river or from the Kankakee to Ottawa in a boat.

Q. What was the color of the water prior to the opening of the drainage canal?

A. Why, it was inky.

Q. Did it have any aroma to it?

A. Yes, it smelled like sewage.

Q. Did fish thrive in the Illinois river prior to the opening of the drainage canal?

A. Well, I never fished in the river from the time that the pumping works was started. I have never fished any since.

Q. What effect, if any, has the opening of the drainage canal and the turning of Lake Michigan water into the Illinois river had upon the Illnois river at this point?

A. Well, it is not so dark and it don't smell so strong.

Q. Is there any smell to the river at present?

A. Very little.

6484 Q. How perceptible is that odor?

A. Well, I was across the bridge Sunday night and you could smell a little, crossing the bridge last Sunday.

Q. How does the color of the water compare now with the color that existed prior to the opening of the drainage canal?

A. Why, it is a good deal lighter color, clearer.

Q. What is your opinion from what you know of the Illinois river as to whether the opening of the drainage canal has been a benefit or a detriment to the Illinois river at this point?

A. I should say it betters it.

CROSS-EXAMINATION, by Mr. Jeffries.

Q. Why do you say it has bettered it?

A. Why, it looks better, it is lighter colored, looks clearer and does not smell so strong.

Q. That is the only reason?

A. That is the reason; I judge from appearances.

Q. Nothing else?

A. No.

Q. What is the cause of this smell up here in the street now, today; I noticed it coming down here?

A. Why, I smelled the tannery along about eleven o'clock. You can smell the tannery when the wind is right.

6485 Q. Can you distinguish the difference between the smell from the tannery and that from the river ?

A. Yes, sir.

Q. You could before the canal was opened?

A. Yes, sir. The reason I say that, I am at the tannery quite often, and I know where the smells come from; a stranger might not be able to tell it.

Q. Well, you find that the current is much stronger in rowing up and down the river, since the canal was opened, don't you?

A. It is quite a good deal stronger.

(F. S. B., Com'r.)

6486 G. W. ELERDING, called as a witness in behalf of the defendants, being first duly sworn by the Commissioner, was examined in chief by Mr. Todd and testified as follows:

Q. What is your name?

A. G. W. Elerding.

Q. What is your business?

A. I am photographer at present.

Q. How long have you lived in Morris?

A. About twenty-six years.

Q. Are you acquainted with the Illinois river?

A. Yes, sir.

Q. What opportunities have you had for becoming familiar with the Illinois river?

A. Well, I consider them the best. Hunted and fished on it all my life, pretty near.

Q. How often do you fish and hunt?

A. Well, when fishing was good in the river, I used to go out and fish two or three times a week, that is in the fishing season, spring and fall, and late years here every spring I go hunting.

Q. Prior to 1900, the opening of the drainage canal, what
6487 was the condition of the water in the Illinois river?

A. Well, that varied with the distance you went up.

Q. Well, just start here and differentiate between this point and as you went up?

A. Well, here at Morris the water was dark; it was pretty near black, and it had a kind of an oily appearance, just like grease, and it smelled very bad, and then the further you went up, why the better it got on the other side. On this side it got worse.

Q. What river enters the Ilinois river on the other side?

A. Well, there isn't any river enters it, the junction of the Desplaines and the Kankakee form the Illinois river.

Q. What side of the Illinois river does the Kankakee enter it?

A. On the south side.

Q. Now, as you went up, on which side would the water be better, and which side would it be worse, the side on which the Kankakee entered, or on the side the Desplaines came in?

A. It would be better on the Kankakee side.

Q. After you passed the Kankakee, what would be the condition of the water in the Desplaines river?

A. Very bad.

Q. To what did you attribute that variety of water on one side bad and on the other side good?

6488 A. Why, it was according to the volume of water coming down the Kankakee river.

Q. How was the water of the Kankakee as compared with the water of the Desplaines river?

A. Why, as much difference as there is between black and white.

Q. In favor of which river?

A. In favor of the Kankakee.

Q. Now, as you went down the stream how did the water become?

A. Well, it became somewhat better; that is what I call the sewage water was probably good water over on the other side.

Q. How far down did that condition obtain?

A. Well, there has been times here when this side of the river would be inky black and on the other side it would be comparatively clear.

Q. Are you acquainted with the river down below?

A. Yes, sir.

Q. How far down would you find that separation of the waters to extend?

A. Well, that depended on the time of the year. If there was a considerable amount of water coming from the Kankakee river, it would extend further and if it was in low water here, sometimes it would be clear across here; in fact further east than Morris.

6489 Q. Well, how far down the river would the Kankakee and the Desplaines river become mingled into a water of general appearance?

A. Well, now, that I wouldn't say.

Q. What was the condition of the water, the average condition of the water of the Illinois river at Morris?

A. At what time?

Q. At any time?

A. You mean since the—

Q. Before the opening of the canal?

A. Why, it was bad.

Q. What do you mean by bad?

A. Well, it had a bad odor, a very disagreeable odor, and there weren't any fish to speak of.

Q. Did you ever catch fish and put them in live-boxes?

A. Yes, sir.

Q. How did the fish live when so treated, before the opening of the canal?

A. Why, in the fall they would live quite awhile; in the summer time, the warmer months, they wouldn't live so long.

Q. Would the fish live in a live-box in the waters of the Illinois river at this point prior to the opening of the drainage canal?

6490 A. Well, I never kept any in live boxes in the Illinois;

those we kept in live-boxes was when we was camping up the river.

Q. What effect, if any, has the opening of the drainage canal had upon the water of the Illinois river at this point?

A. Why, it has improved the water.

Q. To what extent.

A. It is clearer; doesn't smell so bad, and there are more fish.

Q. What kind of fish do you catch here?

A. Rock bass, catfish, sturgeon. I heard of a few perch; I have not caught any myself, not of late years.

Q. Any odor to the water now?

A. At times, yes.

Q. How appreciable is the odor as compared with what existed here before the opening of the canal?

A. Well, before the opening of the canal you could smell the river most any place, that is, in the town here, if the wind was from the south. At the present time unless you are pretty close to the river you don't smell it.

Q. From appearances, can you detect the presence of sewage from Chicago in the water at this point?

A. At times you can.

Q. How does it manifest itself?

6491 A. There is a—it looks a little bit like a sediment of starch floating in the water; it is not on the surface; it is in the water.

Q. Kind of matters in suspension?

A. Yes.

CROSS-EXAMINATION, by Mr. Jeffries.

Q. The current is much more rapid now, isn't it?

A. Yes, sir.

Q. Than it was before the opening of the canal?

A. Yes, sir.

Q. Where does the water from the Illinois and Michigan canal come as it passes up here, what is its source?

A. It comes from the Desplaines river.

Q. Above Joliet?

A. No, sir, it comes in at the junction of the Kankakee and the Desplaines.

Q. Then it empties first into the Desplaines and then it carries the water from the Desplaines as it comes on down?

A. I didn't understand you?

Q. It first empties into the Desplaines?

A. It comes down the canal.

Q. I know, but the canal empties into the Desplaines?

6492 A. Yes, sir.

Q. Then it leaves the Desplaines again further down?

A. The canal?

Q. Yes?

A. The canal and the Desplaines river cross each other at Shannaham.

Q. Have you seen the canal at that point?

A. Yes, sir.

Q. Does it empty into the Desplaines?

A. I think it does.

Q. And then gathers itself on the other side, or is it bridged over?

A. Here at Shanaham?

Q. Yes?

A. Well, it has been a number of years since I was up there, but if I recollect right, the canal—or the Dupage river rather—now just wait a minute, I am mixed up there. The Desplaines river crosses the Kankakee at Shannaham.

Q. How does it get across?

A. What, the canal?

Q. The canal?

A. There is a lock there; it is locked there.

Q. That is, it comes then through the lock?

A. No, sir; it comes from above the lock; the water 6493 mingles there.

Q. The water of the canal and the Desplaines?

A. Yes, I have not been up to Shannaham for a number of years now; that is my recollection. I didn't examine into the location exactly.

Q. Part of it comes down the Illinois and Michigan canal and part down the river?

A. Yes, sir.

Q. When you say the water is better now in the Illinois river than it was prior to the opening of the canal at this point, you are judging altogether from its appearance?

A. From its appearance, yes, and from its use.

Q. Do you use it for drinking and domestice purposes?

A. Why, two years ago we were camping, and we used it to cook with.

Q. You didn't drink it, though?

A. Well, we drank it in coffee; we didn't do that very long, though, it was a case of necessity.

Q. How far up or down the river was that?

A. It was up.

Q. How far?

A. About seven miles from here.

Q. How far down the river have you been?

6494 A. Well, I have been by boat as far as Marseilles, in fact, below Marseilles.

Q. Do you see the effects of the sewage that far down?

A. Well, I was down there before the sewage was turned in.

Q. You haven't been down there since?

A. No, sir.

(F. S. B., Com'r.)

6495 HENRY STOCKER, called as a witness in behalf of the defendants, being first duly sworn by the Commissioner, was examined in chief by Mr. Todd and testified as follows:

Q. What is your name?

A. Henry Stocker.

Q. Where do you live, Mr. Stocker?

A. Here at Marseilles.

Q. What is your business?

A. Oh, I have been in the boot, shoe and harness business, for the last thirty years or over.

Q. What opportunities have you had for observing the Illinois river in the last ten years?

A. Oh, I went up the river once, perhaps twice a week in a boat, that is in fishing and hunting season.

Q. What was the condition of the Ilinois river prior to 1900, the date of the opening of the drainage canal?

A. The water was pretty rotten and filthy.

Q. Just describe the water?

A. Well, it couldn't have been much worse.

Q. Did it have any odor to it?

A. Yes, sir.

6496 Q. What was the character of the odor?

A. It was a most disagreeable smell.

Q. What effect has the opening of the drainage canal had upon the waters of the Illinois river at this point?

A. Well, the water is much clearer and then it has lost that odor, and the only time that I have ever noticed the odor on it since, is some nights you get it on the boat, if it was a foggy night we would smell it. In the day time when the weather was clear there was very little odor to it.

Q. How does the water compare in color?

A. Well, the water is much brighter; it is not so dark and greasy looking.

Q. Has the opening of the drainage canal in your opinion been a benefit or a detriment to the Illinois river?

A. I think it has been a great benefit to it.

Q. In what way?

A. Well, it has done away with that odor and the water is much brighter and better. You can on the bank now, see an object laying in the water ten or twelve inches deep, you can see it. Before you couldn't.

CROSS-EXAMINATION, by Mr. Jeffries.

Q. You judge altogether from the appearance of the water, though, in passing upon the question as to whether it is better or worse than before the opening of the drainage canal? 6497

A. Yes, sir.

Q. You don't drink the water?

A. No, I am not much of a hand to drink water, but I have drank it, but not in the last few years.

Q. Not since the opening of the canal?

A. Well, yes, I have since the opening of the canal, I have drank it up on the other side, up above what we call the railroad bridge.

Q. And what you supposed then was the water from the Kankakee?

A. Well, I presume it was; it does not mix up there like it does after it gets further down.

Q. There is some odor on the water yet, is there not?

A. If I noticed it, it was especially, as I say, especially on a foggy night when the air would be heavy I would notice it. In the day time I wouldn't notice it.

Q. The water at times gets of a sort of a milky color, does it, showing the effects of the sewage?

A. Well, I don't know; I have not paid much attention as to that; I couldn't say as to that.

Q. There is a good current now, is there not?

A. Yes, sir.

Q. And prior to the opening of the canal there was not 6498 a good current?

A. No, this time of the year especially, there would be a very little current in the river.

RE-DIRECT EXAMINATION, by Mr. Todd.

Q. When you say that you judge by appearances, do you eliminate in that answer the observation and the knowledge you obtained through the sense of smell?

A. What do you mean?

Q. As to whether the river is in better condition now than it was before the opening of the canal?

A. That is sense of the smell and upon the appearance of the water, yes.

Q. You include that in appearances?

A. Why, yes, and then of course there is another thing. I don't suppose the fish after a while could have lived in that water here. I never heard of anybody catching any.

Q. Do they live now?

A. Now—indeed they do, I have seen them. Before it was opened up the fish would come floating down—they wouldn't be dead, but they would float on the surface. I have seen catfish, suckers and redhorse; but I don't see anything of that kind now, and have not.

(F. S. B., Com'r.)

6499 J. O. LERETTE, called as a witness in behalf of the defendants, being first duly sworn by the Commissioner, was examined in chief by Mr. Todd and testified as follows:

Q. What is your name?

A. J. O. Lerette.

Q. Where do you live?

A. In Morris.

Q. What is your business?

A. Saloon business.

Q. How long have you been in that business?

A. About 28 years,—27 years, I think.

Q. Are you acquainted with the Illinois river?

A. Yes, sir.

Q. What opportunities have you had of becoming acquainted with the Illinois river?

A. Well, I have boated here for years before that and was on it more or less.

Q. What was the condition of the water in the Illinois river prior to the opening of the drainage canal?

A. Well, a few years prior to that, it was very bad.

Q. By "very bad" what do you mean?

6500 A. Well, it was so bad that cattle and horses wouldn't hardly drink it, and it looked black and smelled a little loud.

Q. How loud was the smell?

A. Well, loud enough for most of the people here to kick in the evening. They complained of it.

Q. What effect has the opening of the drainage canal had upon the water of the Illinois river?

A. Well, it has made it a great deal better.

Q. In what respects is it better?

A. It looks better and well, I don't know as I have noticed any odor since that.

Q. Have you observed anything about the fish in connection with the Illinois river?

A. Well, since the canal has been opened, I have not had much to do with the river. I go down there occasionally and cross the river once in a while, but not so much as I have before that.

Q. You have seen it, though, frequently?

A. Yes, sir.

Q. What in your opinion has been the effect of the opening of the drainage canal and the turning of the water of Lake Michigan into the Illinois river?

A. Well, it has made it a great deal better.

6501 CROSS-EXAMINATION, by Mr. Jeffries.

Q. And when you say it is better, you say so simply from observation?

A. That's all.

Q. And from the fact that there is not as much odor as there was?

A. Well, I have not smelled any.

Q. You have noticed some odor since the opening, have you not?

A. No, sir, I have not. That is, if I have I have forgotten it; I don't recollect it.

Q. You don't use the water?

A. No, sir.

Q. Can you see the effects of the sewage on the water now at any time?

A. Well, I have not been down to the river but little lately, only from the bridge, it didn't seem as though there was any. Of course, I wouldn't want to say there was not.

Q. Your opinion is, though, that there is none?

A. I wouldn't want to say that, but from the general appearances there isn't any.

6502 Q. And the general belief is that there is not?

A. Well, I wouldn't say what I believe, of course that I don't know, but there must be some sewage in it, because there is in mostly all river water.

Q. And more particularly in this because of the immense amount of it discharged in the river and the small volume of water that passes down the river and the short distance from Chicago here?

A. There is a pretty good volume in it now, to what it used to be; there didn't use to be any current in it hardly.

Q. But since then there is?

A. Yes sir, there is.

(F. S. B., Com'r.)

6503 J. C. HORRIE,

called as a witness in behalf of the defendants, being first duly sworn by the Commissioner, was examined in chief by Mr. Todd and testified as follows:

Q. What is your name?

A. J. C. Horrie.

Q. What is your business, Mr. Horrie?

A. Jewelry business.

Q. How long have you been in that business?

A. About twenty years.

Q. Do you live in Morris?

A. Yes sir.

Q. Are you acquainted with the Illinois river?

A. Yes sir.

Q. What opportunities have you had of becoming acquainted with the Illinois river?

A. Crossing it every day, living alongside of it for a life time.

Q. What was the condition of the Illinois river at this point before the opening of the drainage canal?

A. Why to all appearances it was bad, the smell—we smelled it up town easily, in the evening.

6504 Q. What effect has the opening of the drainage canal had upon the waters of the Illinois river at this point?

A. It has been good.

Q. Have you noticed any smell on the water since?

A. No sir, I have not.

Q. How does the water in clearness compare with the conditions that obtained before the opening of the drainage canal?

A. Why, it is a good deal clearer than it was before, more current.

CROSS-EXAMINATION,

By Mr. Jeffries.

Q. You know nothing of the chemical ingredients of the water.

A. No sir.

Q. But you judge altogether from its appearance and the absence of the smell?

A. Yes sir.

Q. Do you see any evidences of Chicago sewage in the water now?

A. Why, I have noticed after a heavy rain there would be small pieces of sticks, something like that, that some have said was sewage, but I have noticed that there was pieces of sticks that would come from the bank or from the overflow.

6505 Q. Well, the current in the river is much more rapid now than it was before the Chicago drainage canal was opened?

A. Yes sir.

Q. And at times before the opening of the canal it was very sluggish?

A. Very sluggish.

Q. In fact the greater part of the year?

A. Yes sir.

Q. You don't use the water from the river?

A. No sir.

Q. And the people here don't use it?

A. No sir, to my knowledge; I don't know of anyone using it.

Q. It has a bad reputation among the people, here has it?

A. Yes sir.

Q. Do you notice that smell or odor that comes from the river now?

A. No sir, we don't smell it now.

Q. You notice it when you go down to the river, don't you?

A. No sir, I cross it quite often and wouldn't notice it at all.

Q. It is your opinion then that the sewage has dissappeared altogether from the water?

A. Compared with what it was before, it has, in my estimation.

6506 Q. You think that the Chicago sewage is having no effect on the water here at all?

A. Well, sure, it must have.

RE-DIRECT-EXAMINATION,

By Mr. Todd.

Q. Can you tell by appearances whether what you see in the water comes from Chicago or Joliet or Kankakee, up on the Kankakee river?

A. Well, what I would call it, it would be the overflow that would come from the banks, such as limbs and sticks and objects of that kind. I never noticed anything in the water outside of being ordinary river water.

Q. As far as appearances go there is nothing to indicate that there is any sewage in the water, is there?

A. Not to me.

RE-CROSS-EXAMINATION,

By Mr. Jeffries.

Q. What is your idea as to the appearance of sewage?

A. Well, my idea of the appearance of sewage would be a thick muddy water and smell bad,—the water.

Q. Do you know, or don't you know, that sewage when it comes from the pipes is a clear, bright color?

6507 MR. TODD: Objected to as it assumes that which does not exist.

A. I don't know.

Q. Did you ever see the water coming from a sewer pipe?

A. Well, I don't say that I have—yes, I have.

Q. You didn't see any mud coming from it, did you?

A. No, I did not.

Q. It was clear, wasn't it?

A. Clear water.

Q. Do you know whether it was pure water or not?

A. Well, I would hate to drink it.

(F. S. B., Com'r.)

6508 FRED SLACK,

called as a witness in behalf of the defendants, being first duly sworn by the Commissioner, was examined in chief by Mr. Todd and testified as follows:

Q. What is your name?

A. Fred Slack.

Q. What is your business?

A. Deputy sheriff here in Grundy County.

Q. How long have you been connected with the sheriff's office?

A. Since last December.

Q. Are you acquainted with the Illinois river?

A. Yes sir.

Q. What opportunities have you had of becoming acquainted with the Illinois river?

A. I have fished and hunted on it a great deal.

Q. Do you know the condition of the Illinois river before the opening of the drainage canal?

A. Yes sir.

Q. What was its condition?

A. Why, it was sluggish; the water was stagnant and had a bad odor.

6509 Q. What was its color?

A. Black, so black at times I could hardly row a boat through it, it would get on the bottom of the boat like ink.

Q. What effect has the opening of the drainage canal had upon the waters of the Illinois river at this point?

A. Why, it has been a benefit to it.

Q. In what way?

A. Well, in one way there is much more water flowing through here and the water is clearer.

Q. Do you observe the odor?

A. No sir.

Q. Have you had any experience that would enable you to pass an opinion in regard to its effect upon fish?

MR. JEFFRIES: We object to the question because it is calling for an opinion from the witness without stating the reasons for his qualification, or the experience that he has.

Q. What experience have you had?

A. By rowing up and down the river.

Q. Have you fished in the river since the opening of the canal?

A. Yes sir, and before.

Q. Now what is its effect upon fish?

A. Since the opening?

6510 Q. Yes?

A. Why, there is fish in the river at the present time, they live in there.

Q. How do you know there is fish in the river at the present time?

A. I have caught them out of there.

Q. Before the opening of the canal did you catch any fish in the river?

A. Not for a long while.

CROSS-EXAMINATION,

By Mr. Jeffries.

Q. Your opinion as to the condition of the water now as compared to what it was before the opening of the canal is based simply upon your observation as you have testified here, a moment ago in your direct-examination?

A. Yes sir.

Q. Nothing else?

A. No, I have never—

Q. Do you know whether there is any Chicago sewage in that water or not?

A. Well, they say there is, I have never seen it.

Q. Well, what is your opinion about it?

6511 A. Well I have an idea that there is, yes, but I have never been able to find it.

Q. Well, you know when sewage comes from these large cities, there being no solid matters of any kind in the water, or garbage thrown into the sewers, that it looks like pure water, don't it?

A. Yes sir.

Q. Then it would be a difficult matter to tell from the eye whether it contained sewage from Chicago or not, wouldn't it?

A. It would.

Q. That is so far as its appearance is concerned?

A. Just to look at it, you wouldn't think there was any in it.

Q. You don't drink the water, do you?

A. No.

Q. Nor use it for domestic purposes of any kind?

A. No sir.

RE-DIRECT-EXAMINATION,

By Mr. Todd.

Q. Do you know whether as a matter of fact there is any sewage in the water here?

A. I don't know.

6512 Q. Do you know whether as a matter of fact that all the sewage has completely disappeared by processes of oxidation before it reaches this point?

A. I couldn't tell that.

Q. You haven't gone into that?

A. No.

Q. All that you know about it is simply from its appearance?

A. That is all.

Q. And from its appearance can you detect the presence of any sewage in it?

A. No sir.

Q. Then as to whether there is any or not, it is purely conjectural with you?

A. Yes sir.

ADJOURNED.

STATE OF MISSOURI

6513 VS.

THE STATE OF ILLINOIS and the SANITARY DISTRICT OF CHICAGO.

Met pursuant to agreement of counsel representing the respective parties, at room 869 Rookery Building, Chicago, Illinois, 10 A. M., September 21, 1903.

Present: The Commissioner.
Messrs Jeffries and Woerner,
representing the complainant.
Messrs. Hamlin, Todd, Springer and
Drennan,
Representing the defendants.

6514 R. P. ELLIOTT,

called as a witness in behalf of the defendants, being first duly sworn by the Commissioner, was examined in chief by Mr. Todd and testified as follows:

Q. What is your name?

A. R. P. Elliott.

Q. What is your business?

A. I am express agent at Wilmington, Illinois.

Q. How long have you been engaged in that business?

A. I think since 1886 I have been the agent there.

Q. And on what river is Wilmington situated?

A. The Kankakee river.

Q. Mr. Elliott, did you ever take and collect any samples of water for the Sanitary District of Chicago?

A. I did.

Q. What year did you collect the water?

A. Commencing June 5th, 1899, and ending June 25th, 1900, is about the time I examined.

Q. Where did you collect the water from?

A. The Kankakee river just below Wilmington.

Q. For whom did you collect the water?

A. I collected it for the Health Department in Chicago and Prof. Jordan at Englewood, and what's-his-name at 6515 Urbana, Palmer,—W. A. Palmer, I think it was,—Urbana, Illinois.

Q. When you collected water for Prof. Jordan of Englewood, that is Prof. Jordan of the Chicago University, isn't it?

A. Yes.

Q. And the Health Department of the city of Chicago, and Prof. Palmer of the University of Illinois?

A. Yes sir.

Q. Where did you collect this water from?

A. The Kankakee river.

Q. At what point?

A. Just north of Wilmington— of the city of Wilmington.

Q. Does the sewage of Wilmington empty into the Kankakee river?

A. In fact we have no sewage there.

Q. There is no open system of sewerage used by the inhabitants of Wilmington?

A. No sir.

Q. Mostly privy vaults?

A. Yes sir, mostly privy vaults.

Q. In what did you collect this water?

A. In glass bottles.

Q. Where did you get the glass bottles from?

A. They were sent to me by the Health Department of Chicago, Mr. Reynolds I think.

6516 Q. Dr. Reynolds?

A. Yes sir.

Q. When you got these bottles, how did you get them, by freight or express?

A. They came by express.

Q. When you got them were they shipped in your name?

A. Yes sir.

Q. When you got them from the express office, in what condition were they?

A. They had a cloth tied around them with a string around it.

Q. And the stopper inserted?

A. A stopper inside with a cloth tied around it.

Q. Now after you got the bottles, for the collection of the water, will you describe the manner in which the water was collected?

A. Yes, I took these glass bottles with the glass stopper, and submerged them in the water of the river and let a little run in; then rinsed it out; then put it back and submerged it in the water and let it run full.

Q. How many bottles did you have?

A. Two bottles.

Q. What were the sizes of the different bottles?

A. I should judge about two gallons; I never measured them; the large bottles were that high (indicating).

6517 Q. Any small bottles?

A. Yes, there was a small bottle that I filled in the same way.

Q. Now describe the method you pursued in filling the bottles?

A. The small bottle?

Q. In filling it with water?

A. Well, I put the cork in and submerged it under water some eight or ten inches or more and let it run into the bottle.

Q. When you got the bottle, the cork was in the bottle, wasn't it?

A. Yes, sir.

Q. When did you take the cork out of the bottle?

A. After I got down to the river.

Q. Before or after the bottle was submerged in the water?

A. I took it out after I submerged the bottle in the water.

Q. You took the cork out after you put the bottle under the water?

A. Yes, sir.

Q. How much water did you put into the bottle the first time?

A. Probably a quart.

Q. Then what did you do with that water?

A. Rinsed it and threw it out.

6518 Q. Did you stop it up under the water? Stop the bottle under the water after rinsing it?

A. Yes sir.

Q. And after you had thrown the water out, then what did you do?

A. Then I put the stopper back, submerged it under and filled the bottle.

Q. After you had filled the bottle, did you stop it under the water?

A. Yes sir.

Q. Now after you had the bottles filled in the manner indicated, what did you do with the bottles of water so collected?

A. I took them out to the express office and put a cloth around them. It is a rubber cloth, and I put this wire seal that Prof. Reynolds sent me and wired it and pierced it through the cloth around this bottle and sealed it with these lead stamps that he sent me. He sent me a seal for the purpose.

Q. What else did you do?

A. Then I shipped them to these different parties by express. I made out that slip, of course, and put it in. I made out that slip, and I took the direction of the wind, I think and the water if it was raining I think. There were different 6519 directions. I forget just exactly now, what. I made out that slip; put it in an envelope, sealed the envelope and sent that to each one of the parties at the time I took the water, the hour and the date, etc., and put that in the envelope. That was in the tags they sent me with an envelope to put that in. And the slip was sent to each one of the parties I sent the water to.

Q. I show you a tag on the back of which is printed "Stream examination, Chicago Sanitary District; Sample of Water (In large type) Sample No. 4, and ask you if that card is in your handwriting?

A. Yes sir, that is in my handwriting.

Q. With instructions on the back of the card?

A. Yes sir.

Q. Did you place a card similar to that card upon the samples of water you sent out?

A. Yes sir.

Q. Filled out in the same manner that this card is filled out?

A. Yes sir.

Q. Did all the cards which you put on the water collected and sent to all the different parties indicated in your testimony, have a sample number, date, time from the place taken, collected by; height of water; temperature of water; direc- 6520 tion of wind; temperature of air, printed on it as indicated on this card I show you?

A. All filled out the same way.

Q. And the part of the card left to be filled out, you filled out in accordance with the facts as you observed them at that time, did you?

A. Yes sir.

Q. Now after you had collected the water and filled out the card as you have indicated, and sealed the packages, did you pack any of the samples in ice?

A. Yes, there was the little bottle I packed in ice. I don't know how long or how many times I did that. It was several times I did that. That came to Professor Jordan at the Chicago University.

Q. Just describe how you packed the sample that was to be packed in ice?

A. Now I chopped up the ice, and I think they sent me a little can or something. If I remember right, they sent me a can that I put that in, and the arrangement was sealed I think, the same as the large bottle. It was prepared the same way as the large bottle, only it was iced as near as I can remember.

Q. Now after you had prepared the sample in the manner you have indicated, both the large and small sample, 6521 what did you do with them?

A. Sent them to Prof. Jordan.

Q. And Professor Palmer?

A. Prof. Jordan is the one that I shipped the ice one to.

Q. I mean all the samples?

A. Prof. Palmer and the City Health Department of Chicago—that was the direction of the City Health Department of Chicago, and Professor Jordan at Englewood, and Professor Palmer at Urbana, Illinois.

Q. How did you ship them?

A. By express.

Q. How long after you collected the samples, was it, before you delivered the samples into the charge of the express company?

A. Well, ranging all the way from an hour to an hour and a half.

Q. By what express company did you ship the samples?

A. United States Express Company.

Q. Were you the agent of it?

A. Yes sir.

Q. You saw the samples went out on time.

A. Yes sir, over the next train, after I collected them.

MR. TODD: Mr. Commissioner, I offer this card as a sample of the cards which were placed upon all samples 6522 as testified by the witness as the Sanitary District of Chicago's Exhibit No. 12 for identification.

CROSS-EXAMINATION,

By Mr. Jeffries.

Q. When did you say you commenced taking these samples of water?

A. June 5th, 1899.

Q. How often did you take them?

A. Once a week.

Q. Now during all this time you took samples in two kinds of bottles, a large bottle and small bottle?

A. No, not all the time. I don't think I took it in the small bottle all the time; I don't remember that I did.

Q. June 5th, the first time you took the samples, did you take both the small and the large?

A. Now I am unable to tell that, whether I took the small bottle at that time, or just as to the times I took them.

Q. The small bottles, after being shipped to you you found them at the express office, did you?

A. I shipped them myself; I am the agent there.

Q. The question is, when you got them, where did you get them.

A. I got them from Professor Reynolds of Chicago; they were shipped to me from Chicago.

6523 Q. Where did you get them the first time?

A. At the express office.

Q. In Wilmington?

A. Yes sir.

Q. How did they come, shipped in boxes?

A. By express, two bottles in one crate.

Q. Were they wrapped in any way?

A. No they were packed; the top was wrapped, over the cork with a cloth; it was wrapped with a cloth.

Q. Now what did you do with them when you got them out of the express office?

A. I kept them there until the day I shipped them.

Q. Kept them right there at the express office?

A. Yes sir.

Q. You say you went from the express office how far to the place where the samples were taken, the place in the river?

A. A half a mile or three-quarters, I guess.

Q. How did you go—walk?

A. No sir, I took my express wagon.

Q. Did you unpack the bottles at the express office or wait until you got to the river?

A. At the river.

Q. You took the box and all, down to the river?

A. Yes sir.

6524 Q. How would you get out into the river to get the samples?

A. Drive my wagon out into the river.

Q. How deep was the water?

A. Probably a foot and a half or two feet deep, somewhere along there.

Q. How did you get down to the water from the wagon?

A. Got on the step of my express wagon and held the bottles down under the water.

Q. Now you took the cork out after you got the bottle under the water?

A. Yes sir.

Q. Now, how could you take the cork out of the bottle, hold one hand on the wagon and holding the bottle in the other hand?

A. I done that easy enough.

Q. How low was the step?

A. It was right down in the water.

Q. The step was right under the water?

A. Yes sir.

Q. You stooped down?

A. Yes sir.

Q. Took the cork out?

A. Yes sir.

Q. And put the bottle under water?

6525 A. Yes sir.

Q. Is that right?

A. Yes sir.

Q. This cork was taken out just when you submerged the bottle under water?

A. I always put it under water and then took the cork out.

Q. Well, the bottle was under water?

A. Yes sir.

Q. Then you let a little water in the bottle and rinsed it out?

A. Yes sir.

Q. Now while you had the bottle out of water shaking it, and before you poured the water out that you had just let in, where was the stopper?

A. Why I held that in my hand.

Q. Which hand did you use for holding it?

A. My left hand.

Q. How did you hold it?

A. In my hand.

Q. Just anyway?

A. Yes sir.

Q. Did you hold it tight in your hand this way (indicating)?

A. Yes sir.

Q. The whole stopper would be covered with your hand?

A. No sir, not all. I might have sometimes laid it on
6526 the seat of the wagon, I don't know.

Q. As a matter of fact you did, didn't you?

A. Sometimes I expect I did.

Q. Most all the time as a general proposition, that is the way you did it?

A. I expect so.

Q. Now were the roads muddy at that time?

A. Sometimes, and sometimes they were not.

Q. You would just drive the wagon right into the middle of the stream?

A. I wouldn't do it all the time.

Q. When you used the wagon?

A. Yes sir.

Q. You drove the wagon into the middle of the stream?

A. I didn't drive into the middle of the running water; just deep enough to take the water.

Q. How far?

A. 25 or 30 feet.

Q. You took the water from one side of the wagon and then from the other?

A. No; generally on the left side. I didn't get behind the wagon; I aimed to get good running water in the bottle.

Q. You don't know whether there was mud on the wagon wheels?

6527 A. No, nothing from the wagon wheels got into it at all.

Q. Wouldn't your feet sometimes be muddy?

A. No sir, I aimed to get good running water.

Q. That was your aim?

A. Yes sir, I did do it; I did get good running water out of the river; that was my object to get good running water. No I didn't try to get any mud on them or anything of that kind; I aimed to get a good running sample of water out of the river.

Q. Now after the bottle was cleaned you put the cork back in did you?

A. Yes sir.

Q. You poured the water out and then stuck the cork back in?

A. Yes sir.

Q. Then what did you do?

A. After I got the bottle filled, after I rinsed the bottle?

Q. Then what did you do?

A. I submerged the bottle and filled it.

Q. What did you do with the bottles?

A. Took them out and put them in the wagon, and put them in the box they gave me; took them to the express office and put these rubber cloths over them.

6528 Q. Now where did you put the rubber cloths over them?

A. At the express office.

Q. In other words you carried them from the river down to the express office just as they were when they came up out of the water?

A. Yes sir, that's right.

Q. You didn't wrap them?

A. No sir, not until I got to the office.

Q. Open to the light and everything?

A. The stopper was in.

Q. There was no rubber around to shut out the light or anything of that kind?

A. No sir.

Q. Now you took the correct temperature of the water did you at all times?

A. Why not always; sometimes I did. I couldn't always. One time I would and one time I wouldn't.

Q. You wouldn't always send the temperature?

A. Not always.

Q. When you did take the temperature you always got it correct?

A. Yes, they sent me an instrument for that purpose.

Q. Sent you a thermometer?

A. Yes sir.

6529 Q. Do you know what kind of a thermometer it was, whether it was Fahrenheit?

A. No sir, it wasn't Fahrenheit, I forget the name. It was the other instrument they sent, Centigrade.

Q. Did you use that instrument all the time?

A. All the time.

Q. Now after you got the bottles filled with water and back to the express office, how long was it before they were packed?

A. I wrapped them and packed them right away, as soon as I got to the office. I got them ready for shipment as soon as I got to the office.

Q. Now then, from the time you took the samples out of the river until you got to the express office, there was no iron around these sample bottles, was there?

A. No sir, I ironed them there; they were ironed right at the express office. There was no iron around them.

Q. You came along here and talked to people and stopped?

A. No sir, my time was pretty precious; I had to get back to the office.

Q. How long did it take you to go to the river?

A. It took me five or ten minutes.

Q. Sometimes longer?

6530 A. No sir, I shouldn't think over ten minutes.

Q. Now after you got back to the express office with the samples, there would be occasions, and in fact quite frequently some urgent business to be attended to and you simply set the samples of water aside and packed them at your leisure.

A. Very seldom.

Q. Occasionally?

A. I don't remember that I did. I made it a point. I wanted to get them out of the way as soon as I could get them.

Q. If there was some business to attend to?

A. If I had a customer there waiting, I had to set them aside until I waited on him.

Q. How long did they wait in the express office before being shipped?

A. Sometimes not over half an hour, sometimes an hour before they were shipped out.

Q. What express company did they go through?

A. United States Express Company.

Q. Now in the winter time how did you take the samples?

A. Sometimes I couldn't take them; I would have to violate the rules, I couldn't take them.

Q. How would you violate the rules, in what way?

6531 A. Took them under the ice. I couldn't follow the rules as I could in the summer time. Sometimes I would have to dip the water out and put it in.

Q. What did you dip it with?

A. A dipper that I had.

Q. You had a dipper that you carried from the express office down to the river?

A. Yes sir, I had. I couldn't comply with the rules in the winter time.

Q. Now how often did you use that dipper?

A. I guess there was several times I used it; I couldn't remember.

Q. In the winter time?

A. Yes.

Q. Did you rinse the bottles then?

A. Yes, I always rinsed the bottles out; I attended to that part of it.

Q. How much water was there in the river; what was the average volume of water in the river as to depth?

A. Well in some places pretty low.

Q. Where you took the samples, that place?

A. The average would be a foot, foot and a half or two feet. In the winter time it would be a little higher where 6532 I took it.

Q. Sometimes it would get lower than that, it would get lower than a foot?

A. Yes, but not much where I would generally get the samples. Some places it wasn't a foot.

Q. Some places no water at all?

A. Yes, there was a place where there was no water at all; that's right.

Q. Water there at all times of the year?

A. Yes, there is water that runs there all the time.

Q. Not very much in volume?

A. There is places where the river gets low.

Q. Now at some places the water in the river along there, doesn't cover over the place, twenty feet wide, does it?

A. There at Wilmington, yes it was wider than that.

Q. At all times of the year?

A. Well yes, pretty nearly all the times unless there was a very dry season.

Q. How is it a short distance above Wilmington?

A. There is a dam up there. It is wider up there.

Q. How is it below?

A. Well, it is the same way. The bridge there is 500 feet wide.

6533 Q. I am talking about the water.

A. The water spreads out all over the river. Of course you can go down there sometimes and wade out, but it spreads all over the river.

Q. How far from the edge of the water would you drive in to get these samples?

A. Drive in probably 25 or 30 feet.

Q. Now how wide is the water in the stream, the average width from one end to the other at Wilmington?

A. The wagon bridge there now is 500 feet wide, and the river covers that space between those piers.

Q. Do you mean to say that?

A. But there are some places that ain't that wide.

Q. At Wilmington?

A. Yes sir. Right there at the crossing of the wagon bridge I am speaking of.

Q. Is that above or below the dam?

A. Below.

Q. Now does the water run 500 feet wide during the entire year?

A. Yes, pretty near the entire year.

Q. What do you mean by pretty near?

A. Well, the entire year.

6534 Q. You say it is 500 feet wide there?

A. Well, I wouldn't confine myself to 500 feet. I am telling you that the average is 500 feet.

Q. The bridge might be 500 feet and yet the water not 500 feet?

A. The water is between those piers.

Q. Then the water must be 500 feet wide; do you say that?

A. Well, nearly that, I wouldn't want to be certain; I never measured it.

Q. How wide is it at the narrowest place?

A. At Wilmington?

Q. Yes, right along in there?

A. Well, the narrowest place occurs down below the island there. I should judge it was not less than 300 feet or 400, not much narrower than it is up above the bridge. That would be my opinion.

Q. About the same all along?

A. Yes, there are little islands growing out occasionally.

Q. What is the average depth?

A. I don't know. I don't think I know the average depth of the river.

Q. About a foot?

6535 A. I wouldn't swear what the average depth was.

(Sig. waived. F. S. B., Com'r.)

6536 JAMES MACK,

called as a witness in behalf of the defendants, being first duly sworn by the Commissioner, was examined in chief by Mr. Todd and testified as follows:

Q. What is your name?

A. James Mack.

Q. What is your business?

A. Moulder.

Q. Where do you live?

A. Morris, Illinois.

Q. Mr. Mack, did you collect any samples for the sanitary district of Chicago?

A. Yes, sir. I did.

Q. When did you collect them?

A. The latter part of May, 1899, to the last of November.

Q. For whom did you collect this water?

A. I made three collections; one went to the city laboratory of Chicago; one to the State University and one to the Chicago University.

Q. Where did you collect the water from?

A. Above the bridge at Morris, Illinois.

6537 Q. What river is Morris, Illinois, located on?

A. The Illinois.

Q. Well, where did you collect the samples of water?

A. Above the bridge at Morris, Illinois, in bottles.

Q. In what did you collect the samples of water?

A. In bottles.

Q. Where did you get the bottles from?

A. From the express office.

Q. By whom were the bottles sent to you?

A. Through Mr. Irons.

Q. Connected with the city laboratory of Chicago?

A. Of the Chicago University, I think.

Q. Ernest E. Irons, wasn't it?

A. Yes, sir.

Q. There were other bottles sent to you?

A. One was sent to Palmer.

Q. I mean, who sent the bottles to you?

A. He made arrangements to send them to me by express.

Q. And you got all the bottles that you collected the water with from the express office sent to you by Irons?

A. Yes, sir.

Q. Now, when you got the bottles, in what condition were they?

A. They were packed in a case.

6538 Q. Were the stoppers in them?

A. Yes, sir.

Q. What kind of stoppers?

A. Glass stoppers.

Q. Now, after you got the bottles, at what point in the Illinois river did you collect the samples from?

A. About 100 yards from the north side of the river in the middle of the channel, supposed to be in the middle of the channel.

Q. How did you get out in the middle of the channel?

A. In a boat.

Q. At what point in Morris, did you collect the samples?

A. Just a little above the river bridge.

Q. Has the city of Morris any open system of sewers?

A. No, sir.

Q. Now, when you went out in the river in a boat to collect the samples, just describe how you collected them?

A. Well, I rowed out into the river in a boat and when I got between 100 and 150 feet above the bridge, and got as near as I could to the center of the channel and stopped there and made the collection.

Q. Just tell how you collected the water, how you filled the bottles, and what you did?

A. Well, I took the bottles and took the stoppers out and 6539 rinsed the bottles out, put them under and filled them under.

Q. Where were the bottles when you took the stoppers out?

A. In the boat; I took them from the boat.

Q. Did you take the stoppers out under or above the water?

A. Above the water and kept the stopper in my hand.

Q. Did you rinse the bottles out first?

A. Yes, sir.

Q. After you had rinsed the bottles out, then what did you do?

A. I pushed them under the water and filled them.

Q. After you had filled them what did you do?

A. Put the stoppers in.

Q. Where were the stoppers?

A. The stoppers were right in my hand.

Q. Did you put the stoppers in above or under the water?

A. Above the water.

Q. After you had put the stopper in the bottle what did you do then with the sample you had collected?

A. Put them in the boat and rowed to shore, put them in my cellar where I live and packed them in the cases.

Q. After putting the stopper in the bottle, did you do anything then with the bottle?

6540 A. No, sir.

Q. Did you put any cloth over the stopper?

A. I took it to the house, put a cloth over it and sealed it; put a wire seal around it.

Q. Now, after you had done that what did you do with the bottle?

A. I took the small one and put it in a can and put it in ice. The large one I packed it in a case, and packed it with excelsior.

Q. How long after you collected the sample in the small bottle was it before you packed it in ice?

A. Ten or fifteen minutes.

Q. How far did you live from the river?

A. I live right on the river bank.

Q. After you had packed it in ice and packed the two samples in the large boxes, in excelsior, what did you do with the boxes containing the samples?

A. Sent them to the express office.

Q. What express office?

A. United States.

Q. Did you take them to the express office yourself?

A. No, sir, my boy did.

Q. Before you sent them to the express office, what did
6541 you do with the samples, did you put any card on them?

A. I put cards on them, yes, sir.

Q. What kind of a card did you put on the samples?

A. A card that was furnished or sent.

Q. I will show you a card which is marked Sample No. 2, June 5th, 1899, 6:00 a. m., at the top of which is written, Stream Examination, Chicago Sanitary District, Samples of water, with your name written on as collector, "by James Mack," and ask you if that card is in your handwriting?

A. No, sir. This is not; this is one my daughter filled out. I told her what to put on it.

Q. Did you see her doing it?

A. Yes, sir; I stood over her while she was putting it on.

Q. She did it under your instructions?

A. Yes, sir.

Q. All the data that is filled in in writing, you directed?

A. Yes, sir.

Q. And the data that you gave to be put into the cards, you collected this individually, did you?

A. Yes, sir.

Q. Now, was a card similar to this, printed as this one is
printed, containing the sample number, the date and the
6542 time, "collected by" the height of the water, tempera-
ture of the water, temperature of the air, remarks, etc.,
placed on each sample of water that you sent out?

A. Yes, sir.

Q. Were those placed on the card that you were left to be filled out, correctly filled by you and under your directions, for each sample that you collected and sent out?

A. They were.

Q. After you had attached the card to each sample of water, to whom did you send the water?

A. I sent the water to the express office, and I sent one to the city laboratory.

Q. The city laboratory where?

A.. Chicago, and one to the Chicago University to Mr. Jordan, and one to Mr. Palmer at the State University.

Q. What kind of a thermometer did you employ in taking the temperature?

A. A short thermometer the first two or three samples I took and then they sent me a centigrade.

Q. On the cards here where the temperature of the water and air is placed, it is according to a centigrade thermometer?

A. No, sir, that is not according to a centigrade in that one.

Q. I mean in the cards that you sent, with the exception
6543 that you stated?

A. No, the air temperature is Fahrenheit, and the water is centigrade.

Q. The water is centigrade?

A. Yes, I took the air temperature from the thermometer I had on the end of the bridge, and the water is centigrade.

Q. The kind of thermometer you used is indicated by "C" or "F" on the cards, is it?

A. Yes, sir.

Q. How long from the time of taking would it be before the samples were placed in the express office?

A. About a half an hour.

Q. How often did you take samples of water?

A. Once a week.

Q. During the whole time that you took them, from May to November I believe you stated?

A. No, there was some times I didn't take it on the same day. I didn't get the bottles back. I generally took it Mondays. Monday was the day set, sometimes it was Saturday and sometimes it was the middle of the week.

Q. You took them as the bottles came back to you?

A. Yes, sir.

6544 Q. And the date of taking you placed on the card, so that each card on the samples that contains your name indicates properly the time of taking?

A. Yes, sir.

Q. Did your daughter make out all the cards for you?

A. No, sir, some I made out myself.

Q. Anybody else make out any cards for you except your daughter?

A. No, sir, me and my daughter.

Q. When your daughter made them out, they were made out under your direction?

A. Yes, sir.

Q. And who attached the cards?

A. I did, I attached the cards.

Q. You attached all the cards after they were made out?

A. Yes, sir.

MR. TODD: I offer the card marked Sample No. 2, signed by James Mack, and ask to have the same marked Sanitary District's Exhibit No. 13 for identification.

So marked by the Commissioner.

6545 CROSS-EXAMINATION, by Mr. Woerner.

Q. Mr. Mack, what proportion of these cards did you fill out and how many were filled out by your daughter?

A. I couldn't tell. I could tell by seeing the writing there; that's the only way I could tell.

Q. Give us some idea?

A. Well, most of them were filled out by my daughter.

Q. Why, didn't you fill them out yourself?

A. I didn't have much time. I had to go to work about half-past six o'clock.

Q. Well, would it take you longer to fill them out yourself than it would to direct your daughter?

A. Yes, she could do it much quicker than I could.

Q. You would give the directions?

A. I told her what to put on the card. I told her the temperature of the air when I took it that morning, and the temperature of the water.

Q. And she put it on the card while you were not there?

A. She put it on the card while I was there.

Q. Did you see here write on the card?

A. Yes, sir, and I examined these cards before I put them in the envelopes.

Q. Where did you tell her these things?

A. In the house.

6546 Q. Whose house?

A. My own house where I live.

Q. Now, will you please explain how it is that your daughter could write these things faster when you gave her directions than you could do it yourself?

A. Simply because she could handle a pen quicker than I could; she had a better education than I had.

Q. You are not a good writer, then?

A. No, sir.

Q. Did you make any memorandum at all in respect to these cards that you told your daughter to make out?

A. Yes, sir; I have a memorandum of them all.

Q. Where did you make the memoranda?

A. I made them in the house myself.

Q. Where did you make the memorandum with regard to the height of the water?

A. I just kept that in my mind; I kept that in my memory from the time I took the samples. You see the water rose and fell in the Illinois river.

Q. You kept that in your memory?

A. Yes, sir.

Q. You didn't make any memorandum of that at the time you observed it first?

6547 A. No, sir, not at the time I observed it first.

Q. How did you take the temperature of the water?

A. I put a centigrade thermometer in the water and held it there for three or five minutes.

Q. Then you kept in your mind the number of degrees as shown by the thermometer until you got an opportunity to tell your daughter?

A. Until I got back.

Q. How long did it take you to get back?

A. About ten or fifteen minutes. I did the whole work in ten or fifteen minutes.

Q. You don't mean to say that as soon as you got back you always dictated this to your daughter?

A. Yes, sir.

Q. Was she waiting for you to come back?

A. Yes, sir.

Q. What else did you keep in your mind, the temperature of the air?

A. That I looked at as soon as I got back from the boat. I had a thermometer on the end of the bridge. I live in the river bridge house.

Q. And you kept the height of the water in your mind, too?

A. Yes, sir.

6548 Q. And all these other things to which you make a certificate here?

A. Yes, sir.

Q. Now, you say Monday was the day on which these were to be taken?

A. Yes, sir.

Q. What do you mean by that?

A. I shipped them every Monday.

Q. Who were the people you shipped them to?

A. Dr. Palmer of the State University and Jordan of the Chicago University.

Q. You say sometimes you took them Saturday, sometimes the middle of the week and sometimes Monday?

A. Yes, sir, just as the cases returned. If the cases didn't return in time I couldn't ship them Monday.

Q. Then practically you had to go out and make these tests whenever you got these bottles back?

A. Yes, sir.

Q. And didn't follow the rule about Monday?

A. I didn't follow the rule about Monday for the first four or five samples that were sent. They sent me extra cases so that I could take them every Monday after the first four or five times.

6549 Q. After that you got extra cases, extra bottles?

A. Extra bottles so that I could take them every Monday.

Q. What did you say your business was?

A. Moulder.

Q. Do you work all the time?

A. Yes, sir.

Q. Were you employed as such during this period when you made these tests?

A. I was employed as moulder, yes.

Q. Did you work during that time?

A. Yes, sir, I worked during that time.

Q. When did you begin work in the morning?

A. Seven o'clock.

Q. How long did you work?

A. I worked until half-past four in the afternoon, sometimes five o'clock, depending when I got through.

Q. When did you have your breakfast ?

A. About half-past five or six o'clock.

Q. Then you would go out and take these samples and then go to work?

A. Yes, sir.

6550 Q. You would just go out and take these samples and carry the things in your mind until you told your daughter?

A. No, a card was made out.

Q. You kept these things in your mind until you saw your daughter?

A. Yes, sir.

Q. How old is your daughter?

A. She is 20 years old now.

Q. Where is Morris, Illinois?

A. In Grundy county, 62 miles west of Chicago.

Q. How far is it from the mouth of the Illinois river?

A. About six miles.

Q. Above the mouth?

A. No, sir, west or below the mouth of the Illinois.

MR. TODD: You don't mean the mouth, you mean the source.

A. He calls it the mouth (referring to counsel).

MR. WOERNER: You don't mean it is above the source at all, do you?

A. No, I say it is six miles below the source.

Q. How long is the Illinois river?

A. I don't know, sir.

Q. What is the volume of water there?

MR. TODD: I object to the question as not proper cross-examination of anything brought out by this witness on direct and on the ground that he is not put on as a hydraulic engineer to state the volume of the Illinois river, but merely to show that he collected samples. 6551

Q. MR. WOERNER: How deep is the river there?

A. Where I took the samples about five feet.

Q. Five feet is the deepest?

A. No, there are deeper spots there.

Q. That is the bed of the river?

A. Yes, sir, that is in the channel.

Q. Any dams along there?

A. No, sir.

Q. How wide is the river?

A. A little over 600 feet, when it is full to the banks.

Q. Well, on the average how wide is it?

A. About 500 feet, about 550 feet.

Q. How far out in the river did you go to take these samples?

A. Oh, a hundred feet.

Q. Did you row out?

A. I rowed out, yes, sir.

Q. Did you take the bottles in the row-boat?

A. Yes, sir.

6552 Q. Did you take anybody else with you on the boat?

A. Sometimes I had my boy.

Q. Did you let the skiff float while putting the bottles in the water?

A. No, sir.

Q. What did you do?

A. I anchored it. I had an anchor. I had a float with an anchor attached to it and I attached my boat to that.

Q. You took the stoppers out before you put the bottles in?

A. Yes, sir.

Q. And then you just simply immersed the bottle while you held it in your hand?

A. Yes, sir.

Q. And when it was full you put the stoppers in?

A. Yes, sir.

Q. And then you went back home and had breakfast?

A. No, sir.

Q. You had breakfast first?

A. Yes, sir.

Q. Did you wash the bottles out before you allowed the water to run into them?

A. I filled them and rinsed them out and then filled them again.

6553 Q. How often did you do this?

A. How often did I do what?

Q. Take the samples?

A. I couldn't remember just how many samples I did take.

Q. Once a week?

A. Yes, sir.

Q. You aimed to do it once a week?

A. Yes, sir.

Q. How long did you keep them in the house before you shipped them?

A. I shipped them just as soon as I got back.

Q. How long would that be?

A. From the time I took them until they were on their way to the express office, would be probably half an hour.

RE-DIRECT EXAMINATION, by Mr. Todd.

Q. Right from the time that you took the temperature of the water, how long would it be before you would have it placed on the card by your daughter?

A. Not to exceed fifteen minutes.

Sig. waived. F. S. B.

6554 **JOSEPH WEIS,**

called as a witness in behalf of the defendants, being first duly sworn by the Commissioner, was examined in chief by Mr. Todd and testified as follows:

Q. What is your name?

A. Joseph Weis.

Q. What is your business?

A. That of milk inspector of the City of Chicago.

Q. How long have you been employed by the City of Chicago?

A. Six and a half years.

Q. Were you ever engaged to collect water for the Sanitary District?

A. Yes.

Q. When did you collect samples for the Sanitary District?

A. During the years 1898, 1899 and 1900.

Q. By whom were you directed to collect samples of water?

A. By Commissioner Reynolds.

Q. Of the Board of Health?

A. Yes, sir.

Q. At what points or places did you collect water, Mr. Weis?

A. At Bridgeport pumping station, at the Western Avenue bridge, at the Kedzie Avenue bridge and at the Lawndale Avenue bridge. 6555

Q. In what did you collect the samples?

A. In bottles.

Q. What kind of bottles?

A. Glass bottles.

Q. Where did you get the bottles from?

A. The city laboratory.

Q. Were those bottles prepared for you to collect the samples?

A. Yes, sir.

Q. How were they prepared, do you know?

A. Yes, sir.

Q. State how they were prepared?

A. There were two compartments in a wooden box, one compartment containing the big bottle holding about a gallon; the other compartment held a tin box that included a small four ounce bottle, and both packed in excelsior.

Q. Were those bottles sterilized before you took them?

A. Yes, sir.

Q. By whom were they sterilized, if you know?

A. They were sterilized in our bacteriological department.

Q. You work in that department, do you?

A. Yes, sir.

6556 Q. How many samples of water did you collect at the Bridgeport Pumping Works?

A. I don't remember that. When we started I took only two in 1898.

Q. I mean how often did you take samples on the various dates?

A. That was in 1898. In 1899 and 1900 I used to take three samples of water three times a week.

Q. In 1901?

A. I didn't take any in 1901.

Q. In 1899 how many did you take?

A. Well, that was subject to the order of Dr. Gehrmann.

Q. Now, when you would take this water at the Bridgeport Pumping Works, Kedzie Avenue, Western Avenue and Lawndale, how many samples did you take at a time?

A. Well, sometimes I took a big bottle, and I had a little bottle tied to my big bottle. We had a cylinder made with a lead bottom and that cylinder was fastened to a rope. I inserted the big bottle in that cylinder and tied my little bottle outside, so that I could submerge both bottles, the big and small bottle.

I couldn't get a fair sample any other way, because the borders of the canal were always covered with a fatty substance.

6557 Q. And you submerged this down under the water?

A. Yes, sir, I submerged it.

Q. How deep did you go down?

A. Just to have the big bottle submerged about a foot or a foot and a half.

Q. Then what did you do after you got the sample of water; how did you stop it up?

A. I got about a quart of water in the bottle first, took it out and emptied that bottle and let my bottles down again and filled them.

Q. Where did you cork them?

A. I corked them when I got them outside.

Q. Now, after you got the water—you did this at all the four places, did you, this same method that you pursued in collecting the water?

A. I took the samples at one place.

Q. You did the same thing, used the same methods?

A. Yes, when I went to Kedzie Avenue I did the same thing.

Q. And the same thing at Lawndale and Western Avenue?

A. Yes, sir.

Q. Now, after you got the samples of water collected and replaced the stoppers what did you do with the bottles?

A. I took the bottles and put them on top of my box, took 6558 my rubber, perforated rubber which was fastened with a wire, and sealed and tied my wire around the bottles, and with my pinchers I imprinted a seal on a little piece of lead.

Q. Did you pack any samples in ice?

A. Not the big sample bottle. I put that in one compartment and put excelsior around it, and the other, the four ounce bottle I placed in the tin box and the tin box I placed in a big tin box, and that I filled up with chopped ice.

Q. Where did you fill it with ice, right on the place?

A. I took these samples very early in the morning, at two o'clock in the morning sometimes, and I couldn't get any ice. I waited until I got to the West Side to get an ice man or a milkman that had ice in his wagon and I bought the ice of him and chopped it and filled the can.

Q. How often did that happen?

A. That I couldn't get any ice?

Q. Yes?

A. Very seldom.

Q. And after you got the samples packed in the boxes what did you do with them?

A. I drove down to the city hall and left one box in our laboratory, delivering that big bottle to the city chemist, and took the small sample out and placed it on ice in our
6559 ice box, the two other samples I delivered to the American Express Company, one directed to Professor Palmer in Champaign and one to Professor Jordan at the Chicago University. Sometimes, if I had any business down south, I took the box down there myself.

Q. How often did you deliver the box to Professor Jordan at the University of Chicago yourself?

A. In the morning, early in 1900, then, I had the express company deliver them or I delivered that box to another inspector who lives down there, all sealed.

Q. Did you put any card or memorandum on the sample of water that you took?

A. Yes, that wire with a seal on, went through an envelope in which was placed one of the cards.

Q. What kind of a card did you place on it?

A. A similar card to the one you have in your hand.

Q. I show you the card, on which is written Stream Examinations, Chicago Sanitary District, Samples of water, Sample No. 2943, October 8th, 1900, 2:00 a. m., from the Chicago Sanitary Collector, collected by Joseph Weis, and ask you if that is in your handwriting?

A. Now, here is the number, 2943. I forgot to state that we received a bunch of small tin tags which were num-
6560 bered in rotation. This sample was 2943, the next sample was 2944, and so on. We sealed that with a wire, and that wire onto an envelope and sealed the envelope after we placed these cards in. This is in my own handwriting.

Q. Is that the same kind of a card you used in these samples sent out by you to these different parties?

A. Yes, sir.

Q. And you filled in the blank spaces correctly with the data you collected?

A. Yes, sir.

Q. How did you collect the data?

A. In the first one I got there I had to go down to the canal with my thermometer to take the temperature of the water and I marked that on the card; then I took the temperature of the air and I filled out these cards, three of the cards, on the spot.

Q. What point was that taken at?

A. I couldn't tell; this isn't marked.

.Q In the sanitary canal?

A. It is taken in the Chicago Sanitary canal; it must be Western Avenue or Kedzie Avenue. That is one of the latest samples.

Q. Did you mark on the cards the point in the canal where it was taken?

6561 A. Yes. I cannot explain why it isn't marked on here.

Q. On the cards you took from Western Avenue, did you mark anything more on except Chicago Sanitary Canal?

A. Yes, I put in the number in those and point where it was taken.

Q. I notice in the cards where you took from the Kedzie Avenue, you put "Kedzie" in; but from the other points, I don't find that you indicated that.

A. Well, very likely I didn't indicate on the cards. I took samples at Western Avenue. It was self-understood. I didn't do that.

Q. Look at that card 2904, you have got from Chicago Sanitary Canal, Kedzie Avenue bridge, on the card, and preceding that is simply "Sanitary Canal."

A. Yes, this sample was taken in the morning from the middle of the Kedzie Avenue bridge.

Q. Now, what I asked you did you indicate for the Western Avenue bridge anything more than "Chicago Sanitary Canal?"

A. I do not remember. It seems to me during the year 1900, the instructions were to take the samples either at the Western Avenue or Kedzie Avenue bridge.

MR. WOERNER: I object to his testimony on the ground 6562 that it is having the witness describe what is on the cards and the cards are the best evidence.

Q. I will show you two bunches of cards and ask you to look through these cards and see whether those cards are all in your handwriting or not?

A. Yes, sir.

Q. And are those the cards that were taken and placed on the samples by you?

A. Yes, sir, written and marked by me.

Q. And are in your handwriting??

A. Yes, sir.

Q. The writing on the cards outside of the printed matter correctly states the truth, do they?

A. They contain correct statements, yes, sir.

Q. I mean of the temperature, etc.?

A. Yes, sir.

Q. I notice in this bunch of cards that I hand you three cards with T. J. Kelly's name on them; do you know him?

A. Yes.

Q. Who is he?

A. He is a fellow inspector. He is connected with the same office I am.

Q. Did he collect the samples for you?

6563 A. Well, I was sick one week and he took these samples in place of me.

Q. Outside of these three cards, all the rest of these cards were taken by you?

A. To the best of my recollection.

MR. TODD: Mr. Commissioner, I will ask to have this bunch of cards marked Sanitary District's Exhibit 14.

So marked by the Commissioner.

CROSS-EXAMINATION, by Mr. Jeffries.

Q. How long have you been in the employ of the milk inspection department?

A. Six and a half years.

Q. When did you first commence taking samples for the Sanitary District of Chicago?

A. Well, I can't say it was for the Sanitary District. Dr. Gehrmann ordered me in 1898 to take these samples at Bridgeport Pumping Station.

Q. Who is he?

A. He was the director of the city laboratory then.

Q. At what points did you take the samples in 1898?

A. Bridgeport Pumping Station; then we used to go out on the pier of the pumping station and take those samples at the end of the pier. 6564

Q. Do you know what the purpose was in taking those samples?

A. Yes, sir.

Q. In 1898?

A. Yes, sir.

Q. What was it?

A. For bacteriological examination and for chemical analyses in our own office, and for no other purpose.

Q. Now, how often did you take the samples in 1898?

A. Off and on may be three or four times a month.

Q. Now, did you take the small and large samples or just the small samples?

A. Large samples and small samples.

Q. Now, in 1899 where did you take the samples?

A. I took the samples then from the Bridgeport Pumping Works and from Western Avenue, if I remember right.

Q. How often did you take them in 1899?

A. The same way as in 1898.

Q. About how many samples did you take in the course of the year?

A. In 1898?

Q. Yes?

A. We commenced late in 1898; I wouldn't say.

6565 Q. You commenced late?

A. Yes, sir, it was in August, I should think, about the 15th.

Q. Three or four times a month?

A. Yes, I think fifteen or twenty samples all told in 1898.

Q. How many, all told, in 1899 did you take?

A. Well, I couldn't state that. That new system came in vogue then. We took three samples three times a week; I don't remember about that.

Q. Now, then, in 1900?

A. In 1900 up to about November 1st, we used to take samples regularly three times a week, I am sure, beginning with the spring anyhow.

Q. Now, where did you take the samples in 1900?

A. From the Western Avenue bridge, from the Kedzie Avenue bridge and from the Lawndale Avenue bridge.

Q. Now, in 1901 did you take samples?

A. I don't remember having taken any samples at the canal; we took the samples at the pumping station, and the city water pumping stations for our own analyses, the water reports you see in the newspapers.

Q. Now, in 1900 you took the samples you say, at the Western Avenue bridge?

6566 A. Yes, sir.

Q. As well as the other two points?

A. Yes, sir.

Q. Now, state how wide the river was at that point?

A. Well, I couldn't tell that exactly, I am a poor judge of distance.

Q. What river is it?

A. Well, it is the sanitary canal, the new canal.

Q. How far from the Desplaines river?

A. Well, I don't know how far. The Desplaines river is many miles away from the sanitary district.

Q. How far from the Chicago river?

A. From the Chicago river? I am twisted on that. Is that the Chicago river at the Bridgeport pumping works, one branch of it?

Q. I guess it is.

A. It must be a mile, because Ashland avenue is a mile from Western avenue.

Q. Now, you took the samples from the center of the canal?

A. The sanitary canal.

Q. How did you go at it to take them?

A. I have a rig, the inspectors employ a rig in my office.

6567 Q. Did you take them on the bridge?

A. Right on the center of the bridge.

Q. How did you get to the water?

A. We had a cylinder that I took my bottles in, tying the bottles on a rope. We had a device made with a cylinder, out of sheet iron, with a lead bottom.

Q. Now, how far under the surface would you sink that bottle?

A. I submerged the bottles about a foot I should say.

Q. Why did you put it down a foot?

A. I didn't want to get the surface water, I wanted some water below the surface.

Q. Well, what was the matter with the surface water?

A. Well, it was greasy.

Q. Now, you pulled the cork out of the bottle before you let it down?

A. Yes, sir, I couldn't do it any other way.

Q. What did you do with the cork while you were letting the bottle down?

A. I had it wrapped in my hand.

Q. How did you wrap it?

A. Just took the cork and put the rubber around it.

6568 Q. What kind of a rubber was it?

A. What kind of a rubber was it? It was sheet rubber.

Q. Where did you keep the rubber, in your pocket?

A. No I had a little box with a compartment where I kept my chipped ice. I had it in there with my wire and my pincers.

Q. It was loose?

A. No sir, in the little box.

Q. Did you clean the rubber in any way or wash it?

A. Well, the rubber was sterilized in our office and the box was sterilized.

Q. You put the bottle down and got some water in it and brought it up and emptied it out?

A. Yes sir, emptied the water out of the bottle.

Q. Then you would put it back again and fill it?

A. Then I would let it down again and fill it.

Q. Now that was true with reference to both the small and the large bottle?

A. Yes, the small bottle was tied outside of that cylinder.

Q. You submerged both at the same time?

A. Yes sir.

Q. Now after you brought the bottles out of the water, you immediately put the corks in?

A. I put the corks in right with the rubber on top of it,
6569 with the rubber on top of the cork.

Q. You would have to take the cork out of the rubber?

A. No sir, I kept the cork always covered with the rubber.

Q. Now where would the cork be at the time the bottles were being submerged?

A. Well, the cork was laying on the box. It was laying down flat sometimes.

Q. You took the cork out of the bottle and laid it down on this box:

A. Yes sir, wrapped in the rubber.

Q. Then you would sink the bottle in the water, bring it back up and put the cork back in again. You did it with your hands?

A. Yes sir, I couldn't do it any other way.

Q. Now after the samples were taken and corked, where would you take them to put the ice around them?

A. The big bottle I placed in one compartment.

Q. At once?

A. At once, and the small bottle I put the rubber on and tied my wire around it and sealed with the number and that envelope and then punched it so as to imprint that seal, placed it in the little tin box and placed that little tin box in the big tin box.

6570 Q. Now before you placed the small bottle in the little tin box, did you wrap the bottle with tin foil or anything of that kind?

A. No sir, it wasn't necessary.

Q. It don't make any difference what was necessary, I want to know what you did?

A. No I placed my small bottle in the small tin box and covered it up. The small box was very tight.

Q. What did you do after that?

A. Then I placed the little tin box into a big tin box and filled that tin box up with chipped ice.

Q. You always had your ice with you?

A. Yes sir, most of the time.

Q. And if you didn't you went out and hunted up the ice?

A. I drove from the bridge over to the West Side and the first milkman I struck that had any ice in his wagon.

Q. How far was it from where you were to the West Side?

A. About three-quarters of a mile.

Q. You would go directly would you?

A. Yes sir, I took the samples.

Q. What if you didn't happen to meet a milkman?

A. I didn't rely on the milkman at all; I was looking for an iceman.

6571 Q. And if you didn't happen to meet an ice man?

A. I went into a milk depot and got the ice there.

Q. Then you would take the small bottle out again and repack it?

A. Now in seventy-five per cent of the cases I did this way: I took these samples at Kedzie Avenue and drove over Kedzie Avenue to 31st Street. I drove to 26th and Kedzie Avenue and I stopped there. I had an arrangement with a milkman at 26th and Kedzie Avenue to have that ice for me, chipped. He had the ice already with me and I filled my big tin box.

Q. Now did you do the same way in 1898 and 1899?

A. I don't remember. Those samples were mostly taken in the afternoon.

Q. How deep under the surface did you go in 1898 and 1899 to get the samples?

A. I just went down below as far as my reach would carry the bottles, and drew the bottles out,

Q. And let them gather surface water and all the water?

A. That was all. I guess I couldn't do any different.

Q. Then you didn't use the same precautions in 1898 and 1899 to get the water from beneath the surface, that you did in 1900?

6572 A. No sir.

Q. You didn't pack them in ice either?

A. No sir.

Sig. waived. F. S. B., Com'r.

6573 HARRY HUDSON,

called as a witness in behalf of the defendants, being first duly sworn by the Commissioner, was examined in chief by Mr. Todd and testified as follows:

Q. What is your name?
A. Harry Hudson.
Q. What is your business?
A. Switchman.
Q. Where do you live?
A. Joliet.
Q. Did you ever collect any samples of water for the sanitary district of Chicago?
A. I did.
Q. When did you collect them?
A. In 1899.
Q. From what time to what time?
A. I couldn't give you the exact dates, but from the early spring until along in June, if I remember correctly. It was along in March some time I started taking the samples.
Q. And when did you cease taking them?
A. I took them all that year and gave it up along in June of the next year.
Q. You took the samples in 1899, didn't you?
6574 A. Yes sir.
Q. And in 1900?
A. Yes, the first part.
Q. And where did you take the samples from?
A. From the east bank above Jackson Street, and from the east bank of the river below the Rock Island Bridge.
Q. What river?
A. The Desplaines river.
Q. At what point?
Q. What do you mean by at what point?
Q. Was it Joliet?
A. Yes, sir; at Joliet.
Q. These two points you have enumerated are within the corporate limits of the city of Joliet are they not?
A. Yes sir, they are.

Q. For whom did you take the water?

A. One for the Board of Health in Chicago and one for Professor Jordan of the University of Chicago and one for Professor Palmer at the State University.

Q. In what did you take the samples?

A. I took them in bottles that they shipped to us prepared for the taking of the samples.

Q. How were they shipped to you?

6575 A. They were shipped in a crate of two compartments. One was a large bottle that was packed with excelsior with a rubber covering over the top. This rubber cover was tied around so that the cork couldn't get loose; the other was a small bottle. It was sent in I should judge about a gallon tin pail with the small one inside of that.

Q. From whom did you get these receptacles to take the water?

A. I couldn't say. Mr. Irons made the arrangements to send the bottles to me direct.

Q. Where did you get them from?

A. They were gotten from the express office.

Q. Shipped in your name?

A. Yes sir.

Q. How often did you take the samples of water?

A. Once a week.

Q. Now just describe how you took the samples from the Desplaines river at these two points you have indicated.

A. We usually carried the crate as we received it from the express office to the bank at Jackson Street. There the bottle was taken out and submerged under for eight inches. There the cork was opened, the water was let in,—a little water let in and taken out and rinsed. The cork was put in and the
6576 large bottle put down underneath the water, the cork
taken out and the bottle was allowed to fill within four inches of the top and the cork was put in while the bottle was under water. The bottle was taken out then, this rubber covering was put over the top and the wires tied around under the bottom of it, and sealed with the regular seal, and there was cards with a description of where it was taken, what time and the temperature and the weather. These accompanied each sample. The small bottle was taken in the same way.

Q. You have described how you took the water, have you?

A. Yes sir.

Q. Go on and tell what you did with the small bottle?

A. The small bottle was taken in the same way, only when we took the small bottle up from the water we had to pack it in a compartment I should judge, about four inches high, and this small bottle had a rubber over the top in the same way. We put it inside of this smaller tin and put a top on that tin; then we iced it, filled the larger can up with ice, clear to the top, with chipped ice.

Q. Now after you had filled the bottles in the manner you have indicated and sealed them and packed them, what did you do with them?

A. Took them direct to the U. S. express office.

6577 Q. You took them yourself?

A. Yes sir.

Q. To whom did you send them?

A. Sent one to the Board here, the Board of Health in Chicago, one to Professor Jordan at the University of Chicago and one to Professor Palmer at the State University.

Q. How long from the time you took them out of the water until you got them into the hands of the express company?

A. Generally averaged three-quarters of an hour to an hour, long enough to drive from one place to another.

Q. I show you a tag that has printed on it, "Stream examination, Chicago Sanitary District, Sample of water, sample No. 183" and ask you if that is the kind of tag that you placed on each sample of water collected by you?

A. Yes sir.

Q. Is the sample I show you in your handwriting?

A. Yes sir.

Q. And each sample of water collected by you, did it have attached to it a card with the sample number on it, the date, the time, from where collected, and by whom, the height of the water, the temperature of the water, the direction of the wind, the temperature of the air and so forth?

A. Yes sir.

6578 Q. Were the instructions printed on the back as they are in the card which I show you marked Sample No. 183?

A. Yes sir.

Q. Did you fill out each card that you attached, correctly yourself?

A. Yes sir, I did.

Q. And a card similar to the card that you hold being card Sample No. 183, you attached to each sample of water which you shipped?

A. Yes sir.

MR. TODD: I ask to have card sample No. 183, marked Sanitary District of Chicago exhibit No. 15 for identification. So marked by the Commissioner.

CROSS-EXAMINATION,

By Mr. Jeffries.

Q. Where did you say you took the samples of water in 1899?

A. From the east bank of the river above Jackson Street, about 150 feet above Jackson Street.

Q. That was here in Chicago?

A. No sir, in Joliet.

Q. What river was that from?

A. The Desplaines.

6579 Q. Did you take samples of water at other places than that one place during the year?

A. Yes, I took them from the east bank south of the Rock Island Bridge.

Q. How often did you take those samples?

A. Once a week.

Q. Did you always take them on the same day?

A. Yes sir, every Monday. I couldn't tell you or give you the exact time, I guess about a year I took them straight.

Q. A year in 1899?

A. No sir, not a year in 1899, but a year altogether from the time I started.

Q. You say the samples were sent you by express.—the bottles I mean?

A. The bottles were sent to me already for taking samples and were sent by express.

Q. What express office did you get them from?

A. The U. S.

Q. You went to the express office and got the bottles, did you?

A. Yes sir.

Q. How far is it from the express office to these two places where you took the samples?

6580 A. From the express office to Jackson Street is about 5 blocks from the express office to the Rock Island Bridge is about three blocks.

Q. And did you unpack the bottles at the express office?

A. No sir, the bottles were taken in the condition they were received to the place of collection.

Q. In what condition were they received?

A. Each case had two compartments in it. One side had a large bottle which was packed with excelsior around it, and a rubber covering over the stopper. The other side had a sort of a tin box to put a smaller bottle in, and inside of this tin was another small tin can. I call it a tin can; I don't know what else to call it, and inside of that was a bottle that was packed with cotton around it and a rubber covering over the top.

Q. Now you unpacked the bottles at the place where the samples were taken?

A. Yes sir.

Q. Now how did you get out that 150 feet out into the water?

A. I didn't take it 150 feet out. It was impossible to get it more than a foot out from the shore. The stream is too swift at Jackson Street. It is taken from the water just above the dam.

6581 Q. How deep under water?

A. Eight inches.

Q. Did you use an instrument or did you do that with your hand?

A. With my hand. I had my hand below the neck of the bottle with the stopper at the upper part of it. I held the stopper in that hand.

Q. You would hold the stopper in one hand and the bottle in the other?

A. No sir it was done in this way. I put the bottle down with the stopper in, I took out the stopper this way and let the water in.

Q. In other words, you uncorked the bottle then after it was under water?

A. Yes sir.

Q. Then you got a small amount in the bottle and you took it and rinsed it, poured that out and put it back?

A. Yes, first corked the bottle before putting it back.

Q. What did you do with the stopper while you rinsed the bottle?

A. Held the stopper in the same position.

Q. Then after you took the samples or the bottles out of the water, with the water in them, what did you do?

A. Wrote down the temperature of the water and the
6582 direction of the wind; also the temperature of the air
and the time that the sample was taken.

Q. You wrote that on the bottles?

A. No sir, I wrote that on the instruction card that goes with the samples.

Q. Then what did you do? Go to the other place?

A. These bottles were sealed there before I went to the other place.

Q. And packed in ice?

A. No sir. You couldn't carry ice to the point where the samples were taken. The rig was about 100 feet from where the samples were taken and they were packed there.

Q. After you took the first sample on each day, would you go then direct to the place of taking the other sample and take that sample?

A. Yes sir.

Q. Then from there you would take both samples to the express office?

A. Yes sir.

Q. And what did you do?

A. Stayed with the samples until I saw they were shipped on the 6:40 train.

6583 Q. Where did you put the ice around them?

A. The smaller can was put inside of the larger can and the ice packed around the small can.

Q. With reference to the time?

A. The ice was put in at Jackson Street before I left for the Rock Island Bridge.

Q. Then you would take the Rock Island Bridge sample, and when did you put the ice around that sample?

A. I always took the Jackson Street sample first, and put the ice around it before I left for the Rock Island Bridge.

Q. When did you put the ice around the Rock Island sample?

A. Right after taking the sample, put it around them.

Q. You packed them with ice?

A. Yes sir, took it all with me up from Jackson Street.

Q. Now what time of year was it you took the samples in 1899, spring or fall?

A. From the spring clear through.

Q. Now what part of 1900?

A. Up to about May.

Q. From January the first?

A. From January the first until May. I couldn't give you the exact date when I did quit taking the samples.

Q. Would you reach out from the bank and take these samples?

6584 A. They had to be taken that way.

Q. You took them all that way?

A. Yes sir.

Q. About a foot and a half from the shore?

A. About a foot and a half from the shore.

Sig. waived. F. S. B., Com'r.

ADJOURNED until 2:00 P. M. same day.

6585 2:00 P. M., Monday, September 21st, 1903. Continuation pursuant to adjournment. Present, the Commissioner and same counsel representing the respective parties.

ARLIE TAYLOR,

called as a witness in behalf of the defendants, being first duly sworn by the Commissioner, was examined in chief by Mr. Todd and testified as follows:

Q. What is your name?

A. Arlie Taylor.

Q. Where do you live Mr. Taylor?

A. Lockport.

Q. What is your business?

A. City Electrician.

Q. Did you ever take any water for the Sanitary District of Chicago?

A. I took for the University of Illinois,—I don't know whether—

Q. When did you take them?

A. I believe it was in 1899, I am not certain.

Q. Whom did you take them for, the University of Illinois?

6586 A. Palmer. I believe.

Q. Professor Palmer?

A. I believe.

Q. Where did you take them from?

A. I took one from the drainage at Lockport, above the dam, one from the old canal at Lockport; one from the east side of the drainage canal and a point there at Joliet above Jackson Street and one from the west side.

Q. That was after the drainage canal was opened, was it?

A. After the drainage canal was opened, yes.

Q. The drainage canal was opened in January, 1900.

A. Well the water was turned in, if that is what you mean by opened; that is it was running over the dam at that time.

Q. That is what I mean, it was open, water running over the dam?

A. Yes sir.

Q. And it was after that time that you collected the water?

A. It was after that time, yes sir.

Q. Now how did you collect the water there Mr. Taylor?

A. Well, the bottles used to come to Lockport. There was four of them, and they generally came ahead of time, so I could have them on hand. I used to make my collections on Sunday afternoon, right after dinner. The two bottles at Joliet I took first. I went down on the street car; I couldn't take

6587 the cases in my hands. I had strips around the necks of the bottles just as they came out of the express office, and I went over to Joliet and walked over to Jackson Street. Generally filled one on the east side first and then went to the west side and then back to Lockport and filled the one at the drainage there and then the one at the old canal, and packed them in their cases respectively, and sent them off by the United States Express.

Q. To whom did you send all those cases?

A. To the University of Illinois.

Q. To Professor Palmer?

A. There was no specific name, just University.

Q. Yes, but you were collecting for Professor Palmer?

A. Yes sir.

Q. Now after you had collected samples, how did you pack them?

A. Why, there was little envelopes that came on each bottle, that you filled out a slip which they sent,—you filled that out fully and put that in the box, and a tag on the bottle, in the envelope, and sealed the envelope.

Q. I show you a certificate and ask you if you used certificates of the same kind as the one that I show you?

A. Yes sir, one similar to them.

Q. Similar to that?

6588 A. Yes sir.

Q. And the filling in you did yourself, did you?

A. I did it myself, yes.

Q. And did you fill them all correctly?

A. Yes sir.

Q. And shipped them in the manner that you have stated?

A. Yes.

MR. TODD: I will ask to have certificate marked in pencil at the top 4706, marked Sanitary District of Chicago's Exhibit No. 16 for identification.

Same is so marked by the Commissioner.

Q. How often did you take this water Mr. Taylor?

A. Well, at first I took them every other week, and then finally it got to be every week,—every Sunday.

Q. Describe how you filled the bottles?

A. Well, in the summer time or in the fall when there wasn't ice on the water, I went—the one at Lockport and the drainage canal, I got down onto a scow that was there,—pretty well water-soaked, down rather close to the water. I took the rubber cover off and the string, and inserted the bottle below the water as far as I could reach, removed the stopper, allowed some water to enter, put the stopper back in and rinsed the bottle out; emptied the water out, put the cork back 6589 in, inserted the bottle into the water as far as I could reach, took out the stopper, filled the bottle, put the stopper back in and took it out of the water; put the rubber cloth over the stopper, tied the string around it, took it to the express office and shipped it off.

In the old canal the best I could do was to reach out from the bank as far as I could, from a projecting stone that was there.

CROSS-EXAMINATION,

By Mr. Jeffries.

Q. What time of the year did you commence taking samples in 1899?

A. I believe that I started about in the summer, and took up to about the next spring, though I am not certain.

Q. Are you right sure it was in 1899, or 1900?

A. Well, I say as to that I could not definitely state, because I don't remember; I kept no slips or anything. I was going to school at the time, and I did it then.

Q. It was one of those two years?

A. Yes sir.

Q. And you began when?

A. I think I began along the latter part of the summer.

6590 Q. And continued for how long?

A. Well, up to the next spring, or very nearly to the next spring and then they ceased to collect there.

Q. Now how often did you take the samples?

A. At first I believe that I took them every other week, or aimed to, and towards the latter part I took them every week,—every Sunday.

Q. Now when you would take one sample you would take a sample at the various places at the same time, on the same day?

A. On the same day, yes sir, after dinner, on Sundays.

Q. Now you say you took samples at Jackson Street?

A. Two there.

Q. Yes, one on the west side and the other on the east side?

A. Yes sir.

Q. Of the river or the canal?

A. Well there the old canal and the new canal and the river run together at Lockport, that is the Desplaines, so it is a combination of the three.

Q. It was below that then, was it?

A. It was below where the two flow together,—or the three rather.

Q. How far from the west side did you take the samples?

A. From the bank you mean?

Q. Yes?

6591 A. Well, there is a rock there and I used to get out on the point of the rock and—judging from the bank, it would be about twenty some feet.

Q. Now on the east side?

A. On the east side there was another scow there. It was just a scow or flat-boat that they had been using for telephone work and one thing and another. I used to go out on that. That would make it about ten or twelve feet from the bank, part of the time. Then that was removed, and I made a kind of steps down on the stones so at the latter part there, it wasn't quite as far out in the stream—out may be a foot and a half or two feet.

Q. Was there any ice there at any time?

A. Ice in winter time; there was considerable ice. I used to carry a hatchet and chop a hole through the ice and insert the bottle in the water.

Q. You say you went about eight inches under the surface of the water?

A. Yes sir, about that, as far as I could reach.

Q. Did you rinse the bottles out?

A. The bottles were rinsed.

Q. How did you do that?

A. How did I rinse them?

6592 Q. Yes?

A. Why, put the bottle down; took the rubber off and the string, and inserted the bottle down a ways and removed the cork and then I usually just took them up, put the cork in, shook them thoroughly; then inserted the cork, put the bottle down again, and filled it, and then inserted the cork underneath and then took them out of the water and tied it up—and took the temperature. I always took that, after I had filled the bottles and put that on a little slip of paper I used to carry with me—and the time of day. There was a town clock right there and I used to take it from that.

Q. Where did you hold that stopper while the bottle was under the water,—in your hand?

A. Why I removed the cork when the bottle was under water, and then I used to take the stopper out and hold it until the bottle was filled, and then put my other hand down under the water.

Q. You took that stopper clear up out of the water?

A. While the bottle was filling.

Q. And then put it back again?

A. Put it back again before I brought the bottle out of the water.

Q. Where did you put this stopper while the water was filling the bottle? In your hand?

6593 A. In my left hand, usually, yes sir.

Q. What was the shape and size of the stopper?

A. As near as I could state, I imagine it was just a glass stopper.

Q. Did it have a handle to it?

A. No, just a glass stopper about an inch and a half long about, across the top. I mean just the top of the cork.

Q. Did you ever lay the stopper down while the bottle was filling?

A. Why, I might have but not to my knowledge. If I did it was always laid on something.

Q. Laid on what?

A. Laid on the rubber cloth, but I usually held it in my hand all the time.

Q. Just held it in your hand?

A. Yes sir.

Q. Did you wash your hands?

A. Did I wash them? I suppose so.

Q. Did you wash them just before you took hold of the stopper?

A. Why, they were in the water before that. I suppose I had during the day before.

Q. Did you take the samples of water from the canal above or below where you stood?

A. At the side of me.

6594 Q. At the side, right opposite?

A. Yes.

Q. Never got above?

A. Not to my knowledge; I might have.

Q. Now, where did you go first and take the samples?

A. Down in Joliet the samples were taken first, generally on the east side first; then on the west.

Q. Now, then you would go first to the east side?

A. Generally.

Q. Then you took a sample there and then you went from there over to the west side?

A. Yes, sir.

Q. How did you get over there?

A. Went over Jackson street bridge.

Q. How far would you have to go?

A. Oh, two blocks or so.

Q. Now, then, after you took the sample on the east side, did you pack that in ice just there?

A. No, I had the large bottles. I didn't have any small ones. It wasn't necessary to pack them in ice.

Q. You didn't take any small samples at all?

A. No, sir, just the large, gallon bottles.

Q. Did you take any of the small samples at Lockport?

A. No, sir.

6595 Q. They were all large?

A. They were all large.

Q. Now you took those at Lockport the same way you did those at Jackson Street?

A. Practically, yes sir.

Q. What particular place in the canal did you take those at Lockport?

A. In the new or old?

Q. In the new?

A. Just above the dam.

Q. At the side of the canal or out in the center?

A. Well, about eight feet from the southern bank—eight or ten feet.

Q. How did you get out there?

A. On a scow.

Q. Now those that you took from the old canal, were they taken from the center of the canal?

A. No sir, they were taken from—well there was a rod projecting out and I used to go out on that. That would make it about two feet that I would be, from the bank.

Q. Now after you collected those samples, you then took them to the express office?

A. I did.

Q. What express office?

6596 A. The United States.

Q. And sent them to where?

A. Urbana.

Q. Urbana?

A. Yes sir.

Q. Do you know whether the stoppers in those bottles had been taken out or removed prior to your receiving them?

A. No sir, they had not.

Q. That is, they had not been taken out by you?

A. Well, by no one in the office there since they left whereever they came from.

Q. You unpacked them yourself, did you?

A. I unpacked them, yes sir.

Q. You put no ice around them or anything of that kind?

A. No sir.

(Signature waived, F. S. B., Com'r.)

6597 WILLIAM E. O'BRIEN,

called as a witness in behalf of the defendants, being first duly sworn by the Commissioner, was examined in chief by Mr. Todd and testified as follows:—

Q. What is your name?

A. William E. O'Brien.

Q. What is your business?

A. Drayman.

Q. Where do you live Mr. O'Brien?

A. Lockport.

Q. Did you ever take samples of water for the Sanitary District?

A. Yes sir.

Q. Where did you take them from?

A. They were taken from the Desplaines river at Lockport; from the drainage channel and from the old canal at Lockport.

Q. How often did you take samples of water?

A. Once a week.

Q. Who did you take them for?

A. I took them for Jordan, Palmer and Reynolds. I was to take some for Long, but I forget how often I did take those.

Q. When did you take those for Professor Long?

A. Same time I was taking them for the others.

6598 Q. How often did you take the samples for Professors Jordan, Palmer and the Board of Health of Chicago?

A. Once a week.

Q. When did you begin to take samples of water?

A. I think it was in the spring of 1900.

Q. Did you take any samples in 1899?

A. I don't believe I did; I couldn't say for certain.

Q. Will you look at a card of sample No. 1009, December 26, 1899, collected by P. W. O'Brien, and refresh your memory from that?

A. It is not mine.

Q. Isn't that yours?

A. No sir.

Q. When did you say you began to take the samples?

A. In the spring of 1900, some time.

Q. And how long did you take them?

A. I took them pretty near a year; took them until the fall or winter some place along in there, I couldn't say for certain what time it was.

Q. What did you take them in, Mr. O'Brien?

A. Used to take them in bottles.

Q. Where did you get the bottles from?

A. They were shipped to me from Jordan, Reynolds, Palmer— shipped to the express office. I used to get them from there.

6599 Q. Then just state how you took the water, will you please?

A. Why, took the bottles I got over there, dipped them under the water about a foot; took the cork out, rinsed the bottles out and then filled them up under the water again and packed them and shipped them off.

Q. You did this in all three places that you took the water from?

A. Yes sir.

Q. Did you uncork the bottles underneath the water or above it?

A. Underneath the water.

Q. And where did you put the stopper in?

A. I used to put it in underneath the water.

Q. What?

A. Put it in underneath the water.

Q. Did you rinse the bottles out before you filled them?

A. Yes sir.

Q. Then what did you do?

A. Put them in their cases, packed them up and shipped them off.

Q. Who did you ship them to?

A. To Reynolds, Palmer and the Board.

Q. Board of Health of the City of Chicago?

A. Board of Health—to Reynolds.

6600 Q. Now after you got through packing,—did you pack any of them in ice?

A. Yes sir, I used to pack those small bottles that came in cans; I used to pack those in ice.

Q. Did you take the temperature of the water?

A. Yes sir.

Q. Now after you got through packing them and before shipping them did you place any marks of identification on the bottle?

A. Why the cards that they sent us.

Q. What kind of a card did you put on?

A. Just a little white card. I used to place it in an envelope they sent us.

Q. I show you a card marked "Stream Examination, Chicago Sanitary District, Sample of water," Sample No. 2533, and ask you if that is the kind of a card that was placed on the sample?

A. Yes sir.

Q. And is that in your handwriting?

A. Yes sir.

Q. And did you place a card similar to that on all the samples of water that you collected?

A. Yes sir.

Q. And shipped to the different places?

A. Yes sir.

6601 Q. And on each card that you collected the water, did you fill out the place, sample number, with the number, the date, the time, the place from where the water was taken, with your name as collector, and the temperature of the water, the temperature of the air and the direction of the wind?

A. Yes sir.

Q. And did the cards that you placed on the bottle have the printed instruction on the back, similar to this one?

A. Yes sir.

Q. And each sample had a card of that character?

A. Yes sir.

Q. Now how long from the time that you collected the water, was it before you took it to the express office for shipment?

A. Why, just as soon as I got it packed, it would probably be twenty minutes or half an hour, I delivered it to the express office.

Q. You delivered it in person, yourself, did you?

A. Yes sir.

MR. TODD: I offer this card in evidence and ask to have it marked Sanitary District of Chicago's Exhibit No. 17 for identification.

Card so marked by the Commissioner.

6602 CROSS-EXAMINATION, by Mr. Jeffries.

Q. You say you took samples from the drainage canal at Lockport?

A. Yes sir.

Q. When did you commence?

A. Some time in the spring, in 1900.

Q. Now this same spring and at the same time, you commenced taking samples in the old canal?

A. Yes sir.

Q. Where did you take those?

A. At the bridge at Ninth Street.

Q. Ninth Street bridge?

A. Yes sir.

Q. How far is that from Lockport?

A. Just a block off the main street.

Q. How many samples did you take at those two places?

A. Why I used to take three.

Q. Three a week?

A. Yes sir, for different parties.

Q. You took three samples on one day each week?

A. Yes sir.

Q. For how many weeks about?

A. I couldn't say for certain, but I took it from some time I think it was along in March, I am not sure.

6603 Q. 1900?

A. 1900, along about October or November, some place in there.

Q. You never took samples at any other place or at any other time?

A. No sir.

Q. Where did you get the bottles you say that you put the water in?

A. At the expreses office.

Q. How far is that from Ninth Street Bridge in Lockport?

A. Why, at that time it was about two blocks. It is further now.

Q. And you went to the express office and got the bottles?

A. Yes sir.

Q. And carried them down to—

A. To the canal, yes sir.

Q. ——to the canal?

A. Yes sir.

Q. Did you take the large bottles or the small bottles?

A. I had large and small both.

Q. How did you carry them down—in the boxes in which they came?

A. Yes, sir, in the boxes that they came in. I used to take 6604 them down in a wagon.

Q. How far from the shore did you take those samples?

A. Well, probably a foot, just as far as I could lay on the bank and reach out.

Q. What kind of a bank was it, rock or soil?

A. Well it was partly rock and partly soil.

Q. What did you stand on when you took the samples?

A. Didn't stand on anything, I used to lay down and reach out.

Q. Did you take any samples in the winter time?

A. Yes sometimes it was cold; it was in the cold weather, along in March.

Q. You were on the bank then when you took the samples?

A. Yes sir.

Q. Now you say you took the stopper out of the bottles in the water?

A. Yes sir.

Q. And brought the stopper clear up out of the water did you?

A. Yes sir.

Q. What did you do with it while the bottle was being filled?

A. Held it in my hand.

Q. At all times?

A. Yes.

Q. How many times did you lay it down?

A. I couldn't say.

6605 Q. Several times though, didn't you?

A. I couldn't say that I laid it down at all.

Q. Don't you know that you did?

A. Not to my knowledge I don't.

Q. You know whether you did or not, do you not?

A. I don't recollect ever laying it down.

Q. How did you hold it in your hand?

A. Why; just immersed the bottle, took the stopper out and held it there until the bottle was filled and then put it in the bottle again under the water.

Q. You held the bottle with both hands in the water?

A. No with one hand.

Q. Always with one hand.

A. Always tried to hold it with one hand. I don't know whether I succeeded or not.

Q. Well if you didn't succeed you would know it would you not. Would you hold the bottle in both hands?

A. I might have.

Q. Where was the stopper when you were using both hands?

A. I couldn't say as to that.

Q. Well it might have been lying on the bank some place?

A. I think I held it in my hand all the time. That is all I know.

6606 Q. Now as a matter of fact, don't you know that you did hold the bottle with both hands on some occassions?

A. No sir.

Q. Did you bring the bottle out of the water before you put the stopper in?

A. To rinse it I did.

Q. Then you put it back in the water?

A. Put it back in the water.

Q. Was the stopper in it then?

A. No sir.

Q. You put the bottle down then into the water and took out the stopper while it was in the water?

A. Yes sir.

Q. And let some water run into the bottle?

A. Yes sir.

Q. Then you took the bottle from the water?

A. Yes sir.

Q. And rinsed it?

A. Yes sir.

Q. Put the bottle back?

A. Put the bottle back.

Q. Filled it with water?

A. Filled it with water.

6607 Q. Drew it out and then put the stopper in?

A. No, I used to put the stopper in under the water.

Q. All the time?

A. Yes sir, tried to do it all the time.

Q. Well, when you failed to do it, that way, what way did you do it?

A. Well, I don't know as I ever failed.

Q. What do you mean by saying that you tried to do it that way?

A. Because I don't remember any time that I didn't do it that way.

Q. Now that is true of both the large and small bottles?

A. Yes sir.

Q. Then after you got those samples, what did you do?

A. Why, used to pack them and do them up.

Q. Well, the first sample that you took that day, the first sample that you took each day, what did you do with it then —immediately? Carry it over to the other places where you were going to take samples?

A. Yes, I used to go to the river first and collect my samples there and then go over to the drainage canal, about two blocks from the river and collect them there and then go to the old canal and collect them at the old canal last and take them right up to the express office.

6608 Q. Now you collected them in the old river?

A. In the river.

Q. Just as soon as you had collected them there you went over to the canal?

A. Drainage canal.

Q. And took the samples there?

A. Yes.

Q. From there you went over to the Illinois and Michigan Canal?

A. Yes sir.

Q. Now how far is it from the Illinois and Michigan Canal to the drainage canal at the point where you took the samples?

A. Well, about three-quarters of a mile.

Q. Then after you had taken the samples of water from the old Illinois and Michigan canal, having previously taken the samples from the other two places, you then proceeded to pack all of the small bottles in ice?

A. Yes sir.

Q. You didn't pack them in ice at each place where the samples were taken?

A. At times I did, other times I didn't.

Q. Well, as a general proposition you packed them all in ice at the same time?

A. Yes sir.

6609 Q. Now then, how long was it from the time you took the first sample until the last sample was taken each day?

A. Well, I should judge about twenty minutes to half an hour, something like that.

Q. Then you would take the samples from the drainage canal at Lockport?

A. Yes.

Q. And from there you would go over to the—

A. To the old canal.

Q. —the old canal and from there where did you go?

A. To the express office.

Q. Now before that where did you take—you took samples only at two places?

A. At the river.

Q. You went to the river first?

A. I went to the river first.

Q. And took the sample at the river, then you went over to the drainage canal at Lockport, is that right?

A. Yes sir.

Q. Now then how far is it from the canal—from the river to the drainage canal?

A. About two blocks—two or three blocks.

Q. How long did it take you to go from there over to the drainage canal?

6610 A. Oh, about five minutes I guess.

Q. About five minutes?

A. Yes sir.

Q. How long did it take you to take the sample in the old river,—sometimes longer than others, didn't it?

A. Oh, about two or three miuntes is all, I guess,—probably five minutes.

Q. Well, it was longer than that, wasn't it?

A. I don't know.

Q. About five minutes, is that right?

A. About five minutes.

Q. Then you went direct, did you, to the drainage canal at Lockport?

A. Yes sir.

Q. Did you always hurry or take your time?

A. I used to always hurry because I had other work to do.

Q. Then after you took the sample in the drainage canal at Lockport you went to the old Illinois and Michigan Canal?

A. Yes sir.

Q. That is how far from the drainage canal?

A. About three-quarters of a mile.

Q. How long did it take you to go over that three-quarters of a mile?

6611 A. I ain't much of a race-horse; I guess ten or fifteen minutes.

Q. You drove over?

A. Yes sir.

Q. Now these bottles containing the water that you had taken at previous places were in the wagon, were they?

A. Yes sir.

Q. They had not at that time been packed in ice?

A. No sir.

Q. You took them with you then and after you took the samples out of the old Illinois and Michigan Canal, then you took them to the express office and packed them?

A. Yes sir.

Q. And put them in ice at the express office?

A. Yes.

Q. How far is it now from the old Illinois and Michigan canal to the express office?

A. About two blocks.

Q. About two blocks?

A. That is where it was at the time. It has moved since then.

Q. Now then, how long would it take you, commencing at the first place where samples were taken, out of the river,—to take the samples there, go over to the draingae canal at
6612 Lockport, take the sample there, and from thence to the old Illinois and Michigan Canal, take the sample there, and then on to the express office?

A. Half an hour as near as I could guess.

Q. About half an hour?

A. About half an hour.

Q. Sometimes longer than others wasn't it?

A. I don't see why it would take me any longer one time than it would another.

Q. Did you take the samples—put all of the bottles under the water about eight inches?

A. Yes sir.

Q. Both the large and small?

A. The large and small.

Q. Were those bottles under your care all the time?

A. From the time I received them from the express office, they was.

Q. You don't know whether anybody removed the stoppers from them or not?

A. They didn't I know, after I got them.

Q. You had them right with you all the time?

A. I had them right with me all the time. I used to follow them when they would come into the office.

Q. Well then you kept them right there with you?

A. Yes.

6613 Q. While you were following them?

A. While I was following them.

Q. Did you pack them immediately after you got back to the express office?

A. Yes.

Q. And labeled them?

A. And labeled them.

Q. And sent them out?

A. Yes sir.

Q. Were the packages containing the bottles sealed when you received them?

A. No sir, there was just a rubber cloth over them, tied tightly.

Q. You don't know whether they had ever been removed or not?

A. I couldn't swear to it.

(Signature waived, F. S. B. Com'r.)

ADJOURNED until 10:00 A. M., Tuesday, September 22nd, 1903.

6614 10:00 A. M., September 22nd, 1903. Continuation pursuant to adjournment.

Present, the Commissioner and same counsel representing the respective parties.

T. J. KELLY,

called as a witness in behalf of the defendants, being first duly sworn, was examined in chief by Mr. Todd and testified as follows:—

Q. What is your name?

A. T. J. Kelly.

Q. What is your business?

A. I am dairy inspector.

Q. Mr. Kelly, did you take any water for the sanitary district at any time when Mr. Joseph Weis was taken sick?

A. I took a few samples about two years ago I think it was.

Q. Now as to those samples that you took, where did you take them?

A. I took them from the Western Avenue viaduct in the drainage canal.

Q. How did you take the samples? Just describe what you took them in, how you took them and where you got the bottles?

6615 A. I got the bottles from the Health Department and I had a large bottle and a small bottle for each sample.

Q. Now how did you fill the bottles?

A. Well, we had a rope and I lowered it from the bridge into the water.

Q. Go on now and tell what you did?

A. After I had the bottles filled we packed them, the small bottle I put in a small can and put that into a larger can which was packed with ice. The large bottle, I put that in a case. There were two compartments in the case, and the large bottle I put in the other compartment and packed both of them with excelsior.

Q. Then what did you do after you packed them?

A. I took the three samples down to the Health Department and sent one to Champaign, one to the University of Chicago and one to Dr. Gehrmann, in the Health Department.

Q. Now the one that you sent to Champaign, was that sent to Professor Palmer?

A. Yes I think it was to him.

Q. And the one to the Chicago University was to Professor Jordan?

A. Yes sir.

Q. And the other one to the Health Department to Dr. Gehrmann?

A. Yes sir.

6616 Now did you place any cards on the samples of water?

A. Yes, there was a card with the address.

Q. I show you State of Illinois exhibit No. 11 for identification and ask you to look at the card and see whether that is the kind of a card that you used?

A. Yes sir, that's the card.

Q. Did it have instructions printed on the back for taking the water as this card has?

A. Yes sir.

Q. With the number of the sample and the date of collection?

A. Yes sir.

Q. And the place of collection?

A. Yes sir.

Q. Did you write your name as collector?

A. Yes sir.

Q. Giving the temperature of the water and the temperature of the air and the direction of the wind?

A. Well, I didn't give the temperature of the water; I didn't have any thermometer with me.

Q. You didn't give the temperature?

A. No sir.

Q. But the cards you had, had a place for the temperature?

A. Yes sir. I gave the temperature of the air.

6617 Q. And that card you attached to the samples which were collected by you?

A. Yes sir.

Q. And sent to the parties you have indicated?

A. Yes sir.

Q. How long did you collect the samples?

A. Just about a week; I think I took them three times.

Q. The three cards that have your name, in the package of Weis cards were signed by you and are your cards, are they not?

A. Yes sir.

Q. Those are the three samples that you collected?

A. Yes sir.

CROSS-EXAMINATION, by Mr. Jeffries.

Q. Where did you say you took the samples of water?

A. I took them all from the same place, the Western Avenue Bridge.

Q. And that was out of the drainage canal?

A. Out of the drainage canal.

Q. Now when was that?

A. It was about two years ago; I don't know exactly.

6618 In 1900 or 1901?

A. In 1901 I think; I am not positive agout that.

Q. You took two samples each time, a large one and a small one?

A. Three samples.

Q. Or did you take three of each?

A. Three of each, yes sir, three large ones and three small ones.

Q. Where did you get those bottles?

A. I got them from the Health Department of Chicago.

Q. Did you go to the Health Department and get them?

A. Yes sir.

Q. Then what did you do with them?

A. I drove out there and took the samples.

Q. Now how far out in the water did you get those samples?

A. Well, about the middle of the stream. Of course I was on top of the bridge, you understand.

Q. Now how would you get the bottles down in the water?

A. Why I had a long rope and I had a sinker attached to the neck of the bottle and I let it down.

Q. How deep under the surface did you sink the bottle?

A. Well it was about a foot, or two feet or three feet. You know——the bottle would sink.

6619 Q. You couldn't always tell exactly how deep you would put them?

A. No, so far (indicating) out of sight.

Q. Now, in gathering these samples you removed the cork or stopper of the bottle before you let it down into the water, didn't you?

A. Yes sir.

Q. The bottle had a tendency to fill on the surface of the water, didn't it?

A. No, the sinker would carry the bottle down. That is, it wouldn't carry it down at first, but just as soon afterwards—in a little while it would sink because some of the water would run in, but the neck of the bottle would be down in the water and it would sink.

Q. Some of the surface water would run in the bottle first and then it would go on down?

A. No, not the surface water. It might be six or eight inches below the surface, the neck of the bottle.

Q. Well you don't mean to say there was none of the surface water got into the bottle?

A. Just as it touched the water, there might have been.

Q. Necessarily some of the surface water must have got into the bottle, isn't that true?

6620 A. Well, this sinker naturally would pull the neck of the bottle down.

Q. That mouth of the bottle being opened, it couldn't very well get down without some of the surface water getting into it, could it?

A. Just when it struck the water.

Q. It didn't make any difference what position the bottle was in, some of the surface water would be bound to get into the bottle as it went down?

A. Well I wouldn't say there wasn't some; just a small amount, certainly.

Q. How large was the mouth of those bottles?

A. Well, as large as my finger.

Q. How large was the mouth of the small bottles?

A. Well a little larger than a lead-pencil.

Q. Did you rinse the bottles?

A. Yes sir.

Q. How would you do that?

A. Let them down as you know and pull them out and rinse them out and take the sample.

Q. Now then, when you first got on the bridge at the point where you intended to take the samples, you removed the stopper did you?

6621 A. I had everything prepared first.

Q. I know, but you removed the stopper before you let the bottle down?

A. Before I what?

Q. Before you let the bottle down in the water?

A. Just before I let it down.

Q. The stopper was not put back until after the bottle had been rinsed and the sample finally gathered and drawn up to the top of the bridge where you were, is that right?

A. Yes sir.

Q. Now then where was the stopper while you were gathering this sample while the bottle was submerged under the water and while you were rinsing it?

A. I usually left the stopper right off the sidewalk.

Q. Laid it down on the sidewalk?

A. No sir, it was up off the sidewalk on a piece of paper, something like that I had there (indicating).

Q. Just anything you could get to put it on you put it on?

A. Anything clean. I was always particular about that.

Q. You took it with your hands, picked it up with your hands and put it in?

A. I picked it up with my hand, picked up what you call the top of the stopper. I would not touch the round part of the stopper with my fingers.

6622 Q. Do you remember doing that?

A. Well, I never do that in taking any samples. I take samples every day of city water.

Q. You do now?

A. Yes sir.

Q. Now then after you took those samples what did you do with them?

A. I put the small bottle in the small can and sealed it up with that stopper. Not seal it, but put the stopper in it, and put that into a large tin can and packed it with ice; then I put that in one of the compartments of this box and packed the excelsior around that, and that large bottle, I put that into the other tin can, put that into the other compartment of this box and packed the excelsior around that and took it down.

Q. Where did you do it, immediately after taking it out of the water?

A. Yes sir.

Q. Right there on the bridge?

A. Yes sir, right there on the bridge.

Q. Then where did you take them?

A. I took them down to the Health Department.

6623 Q. How many samples did you say you took for Mr. Weis?

A. I took them three times.

Q. That's all the samples you did take for him?

A. Yes.

Q. Or for the Chicago Sanitary District?

A. Yes sir.

Q. Did you take any for the City Health Department?

A. No sir.

Q. Nor the Chicago Health Department?

A. No sir. These were for the Chicago Health Department.

Q. These were for the Chicago Health Department?

A. Yes. What I mean is, I was working under the direction of the Chicago Health Department.

Q. But you took these samples for Mr. Weis?

A. Yes sir.

Q. In his place?

A. Yes sir, in his place.

Q. Do you know anybody else that took any samples for Mr. Weis?

A. No, I do not.

Q. Did he tell you that anybody ever took any for him?

A. No sir, he was sick at that time.

Q. He was sick at that time?

6624 A. Yes sir.

It is agreed that the agreement made at La Salle in regard to the water takers not being required to sign their testimony shall apply to the water takers whose testimony has been taken in Chicago.

F. S. B., Com'r.

ADJOURNED until 2:00 P. M. same day.

6625 2:00 P. M., Tuesday, September 22nd, 1903. Continuation pursuant to adjournment. Present, the Commissioner and same counsel representing the respective parties.

DR. WILLIAM H. FRASER,

called as a witness in behalf of the defendants, being first duly sworn by the Commissioner, was examined in chief by Mr. Todd and testified as follows:

Q. What is your name?

A. William H. Fraser.

Q. What is your business?

A. I am a physician and surgeon.

Q. Where do you live, doctor?

A. I live in the city of La Salle, Illinois.

Q. How long have you lived there?

A. I have lived there over thirty years.

Q. Doctor, did you collect any samples of water for the Chicago Sanitary District from the Illinois river at La Salle?

A. I did.

6626 Q. What year did you collect the water?

A. In 1899 and 1900.

Q. How often did you collect samples of water?

A. About once a week, pretty regularly every week.

Q. Where did you collect the water from?

A. From the Illinois river immediately south of La Salle.

Q. For whom did you collect the water?

A. For Dr. Reynolds.

Q. Where did you send the water after collecting it?

A. I sent it to Chicago.

Q. Any other place?

A. I sent it also to the Illinois University at Champaign.

Q. Any other place?

A. To the Chicago University.

Q. Did you send any to Professor Palmer of the University of Illinois and Professor Jordan of the Chicago University?

A. Yes it was Palmer I sent it to, to the Illinois University and Jordan to the Chicago University.

Q. In what did you collect the water?

A. In large glass bottles.

Q. Where did you get the bottles from?

A. I think I got them originally from Reynolds. I had three sets of them and they were always shipped back
6627 to me empty, and I shipped them full or nearly full.

Q. How did you get the bottles from Reynolds; how did they come to you?

A. They came with glass stoppers in them and a rubber tied over the top and packed in a box. That is, each bottle was in a compartment in each box.

Q. Did they come by express?

A. Yes sir.

Q. And you received them by express directed to you?

A. Yes sir.

Q. After you received the bottles, just describe the method you pursued in filling them?

A. Well I had a box prepared to hold the number of bottles that I had, and the box fitted my buggy and I took them just as I received them to the river and filled them from the water of the river. Sometimes I took a boat and went out into the river; sometimes I went on the ice, cut a hole in the ice and

got the water from under the ice, or rather it came up of course to nearly the level, or top of the ice. I filled the bottles in that way, and then afterwards I collected a good many of the samples by getting it up from the bridge, the Illinois river bridge. I went to about the middle of the stream with a strap and a large pail, hauled up the water and poured it into the
6628 bottles.

Q. After you had collected the water in this way what did you do with it?

A. Put the stoppers in immediately and put the cover over; brought them home and sealed them with wire and a seal.

Q. And then what?

A. Shipped them by express to the three different places.

Q. Did you place any tag on the water?

A. Yes, there was a tag placed on each of the large bottles.

Q. What kind of a tag was it?

A. A card four or five by three inches.

Q. I show you a tag printed in large letters at the top: "Stream examination, Chicago Sanitary District; samples of water, sample No. 2316" and ask you if that tag is in your handwriting?

A. It is.

Q. And did you place a tag similar to that tag which I show you on each of the samples which you collected and shipped to the three different institutions?

A. Yes sir.

Q. On each tag did you put a sample number, the date of taking, the time of taking, from what river, collected by—(your name written in)—height of water, direction of
6629 wind, temperature of water and temperature of air?

A. I put in most of those things you mentioned, but I didn't put in the temperature of the water, because I had no thermometer. They sent a thermometer, or at least they claimed to have sent a thermometer, but I didn't get it. It must have been taken out of the box before it reached me. I sent them word that I had no thermometer; I got word that they had sent me another but I never got it.

Q. So your tags do not show the temperature of the water or the temperature of the air?

A. No sir.

Q. But with that exception you placed a tag similar to the one I hold in my hand, on each sample of water collected by you?

A. Yes, with the exception of the—I didn't always put on the height of the water, but I think practically they were the same. They were similar to that but perhaps some of the facts were not filled?

Q. On the back of each tag did they have instructions for collecting and sending samples of water as printed on the one indicated here?

A. Yes sir.

Q. How long from the time of taking the samples of water, would it be before the samples were placed in the express office for shipment? 6630

A. Well, inside of an hour or an hour and a half, I think at the outside two hours. It was about a mile from town and of course I had to go to town and seal them up, and it was always done immediately, and they were sent away generally on the morning train I think. They were collected the same morning they were sent.

Q. Did you pack any of the samples in ice?

A. I did.

Q. Just detail how you packed them in ice?

A. I had a small glass stoppered bottle that held perhaps I think about two ounces as near as I remember; perhaps they might have held a little more but not very much, and I had small tin cans with tin covers. I put the bottle into a tin can with some cotton around it; then I put the cover on the can and put that can into a larger can that would hold perhaps from two and a half to three quarts. It might perhaps hold a gallon, I am not sure. It was a good sized can and it had a tin cover as well. I packed the can full of excelsior and ice, put the cover on it and put that into the compartment of the box, it having a compartment around it so as to keep the bottle from breaking and also to prevent too rapid melting of the ice, and these boxes were kept in the same manner as the

6631 other, and shipped by express to the three different places.

MR. TODD: I ask to have the card marked Sample No. 2316 marked Sanitary District of Chicago's Exhibit No. 18 for identification. So marked by the Commissioner.

CROSS-EXAMINATION,

By Mr. Jeffries.

Q. When did you commence taking the samples doctor?

A. In the spring of 1899.

Q. How long did you continue?

A. I continued until the autumn of 1900.

Q. Almost two years?

A. Yes, two years with the exception of the winter.

Q You took right through one winter, didn't you?

A. Yes, I took right through one winter.

Q. How far did you say it was from the point where the samples were taken, to your office?

A. About a mile.

Q. Below the town?

A. No, directly opposite the town, directly south of the town. The river is about a mile south of La Salle, at the city of La Salle it takes a bend to the east of La Salle and then comes back again, west of La Salle.

6632 Q. How often did you take samples, once a week?

A. Once a week practically, yes. I think almost always on Tuesday morning of each and every week.

Q. Now how far out into the stream would you go to get the samples?

A. Most of the samples were obtained as near as possible to the middle of the stream.

Q. How would you get out there?

A. On the bridge.

Q. How high is the bridge above the surface of the water?

A. Probably fifteen, sixteen or seventeen feet.

Q. Now what means did you use to get the water up to the bridge from where you stood on the bridge?

A. I had a large tin can and a strap. I stood on the bridge and let the strap down to get the can perfectly full of water and then hoisted it onto the bridge.

Q. And filled the bottle on the bridge.

A. Filled the bottle on the bridge.

Q. Where did you keep the can?

A. I kept the can in the box at my own home.

Q. Now in getting those samples of water, did you get the surface water or the water underneath the surface of the stream?

A. Well, it was just as the can would fill.

6633 Q. With a mixture of both?

A. Yes I suppose so.

Q. How deep under the surface of the water would you let the can go?

A. It probably went down a couple of feet when it would get full. I would plump it or make it go down a full foot as near as possible, when it would come up.

Q. Now which side of the bridge did you take those samples from?

A. On the east side.

Q. On the east side?

A. On the upper side of the bridge. The bridge runs north and south crossing the Illinois river, which runs east and west, and I took it on the eastern side of the bridge.

Q. Was there a current there where you took the samples?

A. Yes, quite a good current.

Q. Did you have any mud on your feet or anything of that kind at any time?

A. The bridge was pretty clean and no mud would fall into the can or into it coming up. I was very careful. In fact it isn't a muddy bridge at all; it is swept pretty clean by the wind and it was taken right on the upper side.

6634 Q. The wind may have blown the dust and dirt from the bridge into the can as you let it down and pulled it up.

A. Oh, there was a possibility of course, of a particle or two of dust, but I was just as careful as I could be to get a proper sample.

Q. How many cans would you have to draw up before you could get both of your bottles filled?

A. One to rinse the can and the dipper, and then two to fill the bottles.

Q. Where did you keep the dipper?

A. With the can.

Q. Always with the can?

A. Yes sir, they were never used for any other purpose.

Q. Now you kept that at your home?

A. Yes sir.

Q. Did you use a spring wagon or a buggy or something of that kind to drive down to get the samples?

A. I used a buggy.

Q. Now where would you put the can and dipper in the buggy?

A. On the seat beside me.

Q. Now after you had drawn up one bottle of water, then you corked the bottle and put some water in them and rinsed them out?

6635 A. No, I didn't rinse the bottles out, no sir.

Q. What would you do with the stopper of the bottle while you were filling it?

A. Just generally put it on the railing of the bridge.

Q. What kind of a stopper was it?

A. A glass stopper.

Q. What was its shape?

A. It had a mushroom cover, that is, the top of it was mushroom shaped.

Q. Was the top of the mushroom cover flat?

A. No, not quite. It was somewhat rounded.

Q. You just laid that stopper up on the railing of the bridge?

A. Yes sir.

Q. How long would it lay there?

A. Just while I was hauling up the next bottle of water; I had to haul up two to get the bottles filled.

Q. Now how high is this railing on which the stopper was placed?

A. Probably three feet and a half.

Q. How close is it to the travel on the bridge?

A. The bridge is probably sixteen feet wide.

Q. How long had that railing been up there?

A. Not very long, it was a good fresh railing.

6636 Q. Was it a wood railing?

A. It was a good railing put on there.

Q. A wood railing?

A. A wood railing, yes sir.

Q. Was the railing planed or was it just in the rough?

A. It was a painted railing.

Q. Before it was painted though it was planed, wasn't it?

A. Yes, I expect so.

Q. You don't know though of your own knowledge?

A. I think it was.

Q. Now after you brought those bottles down from the bridge and filled them with water you didn't pack them in ice until you got them back up town?

A. No sir, the large bottles were not packed in ice; just the small bottles.

Q. The small bottles I have reference to.

A. Yes sir.

Q. You carried them from the bridge then about a mile up town?

A. Yes sir.

Q. And packed them at the express office?

A. No sir.

Q. Where did you pack them or take them?

A. Took them to my own house.

6637 Q. Did you always pack them immediately after you got home?

A. Right away the same morning that I got the water. They were packed and sent to the express office.

Q. How many times did you take those samples home, doctor, and find some business matter or professional call to make and be an hour or so before they would be packed.

A. No sir; I made it a point to do the work I had agreed to do and I charged them for it, and I did the work just as I would do professional work. That was my call in the morning and I attended to it just the same as I would a professional call and other things had to stop until that was attended to.

Q. Now did you take all these samples yourself, personally?

A. All except one.

Q. Who took that?

A. My son.

Q. Did you pack it and ship it?

A. He packed that and shipped it.

Q. How long would it take you to drive from the bridge up home?

A. Fifteen minutes, perhaps.

Q. Depending on the condition of the roads?

A. It is a good road.

Q. A gravel road?

6638

RE-DIRECT-EXAMINATION,

By Mr. Todd.

Q. Doctor have you investigated the water supply of the city of La Salle?

A. I have.

Q. How large a city is the city of La Salle?

A. It is a city of probably 12,000, from 10,000 to 12,000. It must be over 10,000 now. Somewhere in that neighborhood.

Q. From what source does the city of La Salle get its water supply?

A. Some of the people have private wells and most of the people get their water from a spring, or you might call it a series of springs about three miles to the eastward. The water comes those three miles in a vitrified pipe, and comes by gravity to the pumping station, and then is pumped of course through the city through mains.

Q. Where is the source of the water that goes into that reservoir, where the pumping works are located?

A. The source is about three miles east on the Illinois river bottoms, about perhaps 200 yards. Well perhaps 250 yards south of the Illinois and Michigan Canal.

Q. And where does that water come from?

A. There was a spring at that place that they called the 6639 Smith Spring, and it was first dug out and welled up and the pipe was brought into its bottom you might say; it was covered over the top with cement. It was in a bed of gravel, this spring, the water came up out of the ground and it was dug out and made larger, and then built up around and cemented over the top. It was found that the supply was not sufficient and two artesian wells were put down, and the supply from these artesian wells was run into this reservoir under this bottom into the spring, and there was a spring on the bluff about a quarter of a mile to the westward, that came down from the hill, that we call the dell. That spring was piped through below the canal and run into the same reservoir.

Q. Was there any other source?

A. Then, when we had dry weather—one year we had pretty dry weather; I think it was about three or four years ago that we had it very dry and our water supply was short, and it was late in the autumn, the water had been let out of the canal and this stream that runs into the canal about two or three hundred yards to the eastward of this spring, and a pipe was laid from that river called Crozier's Creek, and a pipe was laid from that creek through below the canal and it discharged this water into this bed of gravel and that made our supply sufficient for the time.

6640 Q. Where did this water come from?

MR. JEFFRIES: I object to the question and move to strike out all the testimony of this witness for the reason that it is incompetent, irrelevant and immaterial, and for the reason that it does not tend to prove or disprove any of the issues in this case.

A. This water of course came from the river, or Crozier's Creek, but the pipe got blocked up more or less from debris getting into it, the pipe leading from the river got blocked up so that it would not discharge the water sufficiently and some of the officials went up and punched holes in the bottom of the pipe as it crossed into the bottom of the canal and let canal water in, and so it discharged canal water instead of water from the river.

Q. What proportion of water from the Illinois and Michigan Canal entered the water supply of La Salle?

A. Well, there is a pool along the canal on the south side for quite a little distance, besides this pipe that runs out of the canal and the water collects in a large pond or pool, and from that pool there is a pipe laid to the water supply, and it is, I think, a six-inch pipe.

Q. Is there any water from the Illinois and Michigan canal
that enters into the water supply of La Salle?
6641 Objected to as leading.

A. Yes sir.

MR. TODD: Where is that?

A. That is at the place that I say—I will explain that if you wish. The Illinois and Michigan Canal stands probably ten feet higher than the ground immediately south of it, so that it has drainage through the bank, through the canal bank into this swampy place, and then that water is collected in the big pond, perhaps twice as big as this room, and there is a little bank of gravel and then there is a place walled off with brick, and the water running through that gravel into this place, in which there is a pipe leading directly from that to the water of Smith's Spring, or the water supply source.

Q. What proportion of the water of La Salle comes from this source?

A. I think there must be about one-quarter of it.

Q. Is there any artificial treatment of the water from the Illinois and Michigan canal that enters the water supply of La Salle before that water gets into the water mains of the city?

MR. JEFFRIES: I object to the question as leading.

A. There is no further treatment than just what I have
mentioned. It is seeping through the bank of the canal
6642 and coming through the pipe that I mentioned, and then
it runs into this swampy place and it runs into this pond, and then from the pond between the pond and the entrance to the pipe leading to the water supply there is a little bank of gravel which is very coarse and the water rushes right through in quite large streams. You can see it coming through quite distinctly.

Q. How thick is that gravel?

A. I think not more than three feet.

Q. Are you acquainted with the general conditions of the public health of La Salle?

A. Fairly well.

Q. Is there any typhoid fever in the city of La Salle?

A. I know of only four cases in the hospital and another on Canal Street and two others in the eastern part of the city.

Q. Have you investigated the source of those cases?

A. Two of them seem to have originated in the city of La Salle; the other two came from the outside.

Q. Those in La Salle, do you know what water they used?

A. Two of them were using city water as far as I could learn, that is two of those families. The others as I say came from the outside.

Q. Do you know what the mortality statistics of La Salle are for typhoid fever during the last two or three years?

6643 A. No, I couldn't tell you exactly; there were quite a number of cases that were brought into La Salle for treatment, from the south side, from Portland, Oglesby and Jones. They were brought into the hospital for treatment; then some of them were treated at home. Of course they belong to our La Salle district you might say, but they didn't use La Salle water.

Q. I mean the citizens of La Salle as a town?

A. We have been comparatively free from typhoid fever for a number of years.

CROSS-EXAMINATION,

By Mr. Jeffries.

Q. How long has the water system of La Salle been in its present condition?

A. Well I will say in its present condition not more than about a year and a half I don't think; that is what you might call its present condition where the water is running directly out of the canal. Of course there was a certain amount of seepage before, but during this time I think, that it was broken, about a year and a half.

Q. Was that done by authority?

A. It was done by some of the authorities of the city I believe. I don't know just what authority they had.

6644 Q. Was it done by the authority of the Board of Health?

A. No, I don't think the Board of Health would give any authority of that kind.

Q. Would you recommend that water, doctor?

A. No sir, I would not.

Q. For domestic or household purposes?

A. No sir.

Q. Or for drinking purposes?

A. No sir.

Q. Now before this water gets into the supply of La Salle, it comes out of the canal into this swamp as I understand it?

A. Yes sir.

Q. Now this swamp is a kind of a bed of gravel, isn't it?

A. Yes, more or less, but there is a good deal of mud of course.

Q. And it spreads out all over that bed of gravel?

A. Yes sir.

Q. Now how large an area has that place where this water comes out and spreads out before it gets into the pond?

A. It must extend probably at least 100 feet. That is in the district that would affect Smith's Spring; it must be 100 feet.

Q. 100 feet wide?

A. About 100 feet.

6645 Q. How far does it have to travel over that swampy place?

A. This pond is not more than from 50 to 75 feet from the canal bank.

Q. Now then doctor, do you know the character of the soil to any considerable depth under the surface of the earth, where this water flows over?

A. It is gravel.

Q. And swampy?

A. Well, it is a part of the Illinois river bottom.

Q. Has it gravel and sand?

A. It has gravel and sand, yes. The bottom-land there is gravel, and mixes with the mud of course, and sand.

Q. Now does this pipe that runs the water from the canal into this stream, is it above or beneath the surface of the earth?

A. It comes out. You can see where it comes out on the surface.

Q. At the edge of the canal?

A. Yes, at the edge of the canal, down below.

Q. You can see it seeping out along there?

A. It runs out quite freely.

Q. Then it percolates on through that sand and gravel about 50 or 75 feet until it reaches the pond?

A. Well, it goes largely on the surface to the pond.

6646 Q. Now after it gets into the pond, there is a consideragle bed of water there, isn't there?

A. Yes, twice as big as this room.

Q. How deep?

A. I should judge not more than four or five feet deep.

Q. That was put there perhaps?

A. Yes, that was dug there perhaps. That was done more for the purpose of catching the spring water than anything else.

Q. Now what water was it put there originally to catch?

A. Well, to catch this water that came through.

Q. All the water that seeped through.

A. Well they had a pipe you know, leading from the river, and I could never understand why they couldn't run that pipe from the river directly into the water supply if they wanted that.

Q. This pipe originally ran from the river?

A. It came from the river.

Q. How far is the river from this point?

A. The river runs into the canal just a little above, a short distance.

Q. Then they run the water from this pipe into this sandy place—

A. And the intention was and they did for a long time, have no other way of getting into this Smith's spring, 6647 except through this bed of gravel that runs between that and Smith's spring, probably 250 or 200 yards away, but some foolish men, I might call them, thought they would have it a little more direct and they made this pond and run the water direct from that to Smith's spring.

Q. Now you say it is your judgment that about a quarter of the water at present comes into this supply through that source?

A. Yes, I think it must be about that.

Q. Are you connected with the water department in any way?

A. No sir.

Q. You just give what your judgment is?

A. Yes sir.

Q. With reference to it?

A. Yes sir.

Q. You haven't measured it or anything of that kind?

A. No sir.

Q. Then it is more of a guess than anything else?

A. Yes sir.

Q. Taking into consideration your knowledge of the situation there?

A. Yes sir.

Q. What other source of supply have they besides this one and the spring in there?

6648 A. Well, there is a spring below that first pipe leading from the spring on the bluff, through below the canal directly into Smith's spring.

Q. Now are there any driven wells there?

A. There are two, but not driven wells, they are artesian wells.

Q. Are they operated by the city?

A. They are flowing wells and they flow into Smith's spring.

Q. Do you know what volume of water they furnish daily?

A. No, I couldn't tell you the amount, but it is quite copious, a large supply. They do a great deal of pumping.

Q. Now what is the city doing to abate that difficulty in the water system?

A. They are digging wells on the bottoms to the south of the city.

Q. Is the city doing that?

A. The city is doing that, yes sir.

Q. With a view of getting rid of this other source?

A. Yes sir.

Q. That is the broken pipe?

A. Yes sir.

Q. The water has been condemned, has it not by your local authorities?

6649 A. The water we are using now?

Q. Yes.

A. Yes, it isn't counted good.

Q. Are you engaged in active practice there at La Salle, doctor?

A. Yes sir.

Q. How many physicians have you there?

A. Well we have generally over ten, ten or twelve I think.

Q. Now you say you have four cases of typhoid fever at La Salle?

A. Yes sir.

Q. Are they under your charge?

A. One of them is.

Q. Do you know of any others who have had typhoid fever there in the last three or four months?

A. Yes sir.

Q. More than now?

A. No I don't think so.

Q. There might be a great many other cases might there not that you haven't information on?

A. There is a possibility, but I made inquiry of the physicians yesterday and I spoke to quite a number of them, asking them if they had any cases of typhoid.

Q. How long have you been practicing medicine?

6650 A. Since 1867.

Q. What school do you belong to?

A. The regular school.

6651 J. W. MILLER,

called as a witness in behalf of the defendants, being first duly sworn by the Commissioner, was examined in chief by Mr. Todd and testified as follows:

Q. What is your name?

A. J. W. Miller.

Q. What is your address Mr. Miller?

A. I live just now in Joliet.

Q. Where is your place of business in Joliet?

A. I am a guard in the State's Prison.

Q. Mr. Miller, did you ever collect samples of water for the Sanitary District of Chicago?

A. The Health Department of the City of Chicago; Dr. Reynolds I believe I got it from.

Q. Where did you collect the water for the sanitary district?

A. In the Illinois river at Morris, Illinois.

Q. When did you begin the collection of samples of water?

A. Well it was in the summer of 1900.

Q. Did you collect any water there in 1899?

A. Yes, it was in the summer of 1899 and on through 1900.

Q. At what point in Morris, did you collect samples of
6652 water?

A. Just south of the town, the Illinois river runs alongside of the city.

Q. How often did you collect samples of water?

A. Once each week.

Q. How many samples of water did you collect?

A. I collected and shipped three samples, two bottles in each sample.

Q. To whom did you ship the samples, Mr. Miller?

A. One to the University of Illinois.

Q. Professor Palmer?

A. Yes, sir, and one to the University of Chicago and I think one to the Health Department.

Q. Of the city of Chicago?

A. Yes sir.

Q. From whom did you get the bottles in which you took the samples?

A. They were shipped to me by those parties I shipped them to.

Q. How did they get to you at Morris?

A. Through the United States Express office.

Q. In what condition were they when they got to you?

6653 A. Well, the large bottle and the small one were in a wooden packing case divided into two compartments.

Q. When you received the bottles the stoppers were in them, were they not?

A. Yes sir.

Q. How did you proceed to fill those bottles?

A. I took them to the river as they were, in the case. I arrived there and sometimes took a boat and sometimes went out on the ice and a few times I went on the bridge, but nearly always in a boat or on the ice. I would remove the stopper from the bottle, put some water in it and rinse it out. Put in the stopper and put it in the water; take the stopper out and let it fill and put in the stopper again. That was when I was in the boat or on the ice. When I was on the bridge I would draw it up and fill it.

Q. After you got the bottles filled and the stoppers inserted what would you do then with the sample?

A. The large sample, I put it in its compartment and packed some excelsior about it; the small sample, I packed it in the small can with cotton around it; placed the tin cover on; put some ice in the larger can, put in the small can, and filled it up with ice. Put on the cover; put some excelsior around it, and they were sealed. This ice wasn't always packed
6654 out there.

Q. When was it packed?

A. Well, within a half an hour.

Q. Now after you had packed the samples, what else did you do, if anything?

A. There was an envelope and some printed slips that had blank spaces in them, the temperature, the height and distance, and there was an envelope with the address of the parties to whom I was to ship them, and some printed slips with blank spaces left for temperature, and the height of the water and some other things. I would put the slips inside the envelopes seal the envelope and attach it to the sample.

Q. I show you a slip printed at the top "Stream Examination, Chicago Sanitary District, Sample of Water, Sample No. 1356," and on the back of which are printed instructions for collecting and sending samples of water for analysis. I will ask you to look at that and state whether that is in your own handwriting or not?

A. Yes, sir.

Q. Is that a sample of the slips you used in sending the water to the different men to whom you sent the water which you collected?

A. Yes, sir, it is.

6655 Q. Did each slip which you attached to the samples contain the sample number, the date, the time, from whence the water was taken, collected by (with your name written in as collector) height of water; temperature of water, direction of wind, temperature of air, rain, similar to the tag that I show you, sample No. 1356?

A. Yes, sir.

Q. Did you attach a card similar to this to each one of the samples that you collected, and made by yourself, correctly stating the conditions?

A. I did.

Q. The same as in this card?

A. I did.

MR. TODD: I ask to have the tag, sample No. 1356, marked Sanitary District of Chicago's Exhibit 19 for identification.

So marked by the Commissioner.

CROSS-EXAMINATION, by Mr. Jeffries.

Q. Where was it you took these samples?

A. Illinois river at Morris, Illinois.

Q. How far above or below Morris?

A. Just opposite the town.

Q. Is there a bridge there?

A. Yes.

6656 Q. At what point in the river did you take them?

A. Near the center of the river.

Q. At the bridge?

A. Above the bridge, usually. Above the bridge always excepting a part of the time when I had to go upon the bridge to get the samples.

Q. How would you get out there to take them, in a skiff?

A. In a skiff when I could get out there, and other times on the ice.

Q. You would dip the bottles down under the water with your hands, would you?

A. Yes, sir.

Q. You took two kinds of samples, a large bottle and a small bottle?

A. Yes, sir.

Q. Where did you get the bottles?

A. At the express office.

Q. Now, how far did you carry them before you got down to the point where you took the water?

A. I should think about 60 rods.

Q. Did you open the box up, the packages that contained the bottles, at the express office?

A. No, sir.

6657 Q. You took them along with you?

A. Took the whole outfit.

Q. Did you take the ice with you?

A. Sometimes; not always; sometimes I had the ice there.

Q. Right there at the river?

A. Right there.

Q. But otherwise you didn't take it?

A. No, sir.

Q. Now, then, did you rinse the bottles?

A. Yes, sir.

Q. How would you do that?

A. Dip the bottles down under the water, filled them and turn the bottle up and shake it out and put in the cork or stopper, then go ahead and take the sample.

Q. Now, then, after you opened the packages containing the bottles, when did you remove the cork or stopper?

A. Why, at once.

Q. Before you put the bottle down under the water?

A. When I went to rinse it out, yes.

Q. You first took the stopper out and put the bottle down under water?

A. When I went to rinse it, yes.

6658 Q. Then you would take it out, rinse it, pour that out, and put it down and fill it?

A. Put the stopper in first.

Q. And shake it?

A. And sink it.

Q. Then you would do what?

A. Then sink it and pull the stopper out and let it fill.

Q. The first time when you went to get the water in the bottle to rinse it, you took the stopper out before you put it in the water?

A. I think so.

Q. Now, then in putting that bottle down under water, how far did you put it down?

A. Well, below the surface, six inches to a foot, I should think.

Q. Did you put the mouth of the bottle down or up?

A. Down.

Q. Then, some of the surface water would naturally run into the bottle, wouldn't it?

A. When I would rinse the bottle it would.

Q. But not when you filled the bottle for shipment?

A. No, the stopper would be in it at that time.

6659 Q. Was the stopper always in the bottle when you selected the sample that you took?

A. I think so.

Q. Do you know it to be so?

A. I calculated to follow the directions as near as possible, and that was the direction and I believe I did.

Q. Now, then, how many samples did you take at each particular place; how many bottles did you usually get at a time?

A. I would say three large and three small bottles.

Q. Now, after you got those bottles and put them in a box again you carried them up to the express office?

A. No, sir, I didn't take them to the express office; not always. If I had the ice there so as to finish shipping at the river, I would take them directly to the express office.

Q. That is in the winter time if you had the ice there?

A. Yes, sir; when I didn't have, I had a place where I took the bottles and had some ice delivered there and packed them in ice there.

Q. Now, where was that place?

A. About half way between the river and the express office.

Q. Now, how far was that?

A. About thirty rods.

6660 Q. You mean this place was about thirty rods from where you took the sample?

A. Yes, sir.

Q: And it was about sixty rods then from the express office to the river where the samples were taken?

A. Yes, sir, that's right.

Q. Now, when you removed the stopper from the bottle, preparatory to getting the water to rinse the bottle, where did you put the stopper, I mean the cork?

A. Yes, I know what you mean. I would just lay it down on the big end of it.

Q. Just any place?

A. If I had a boat I would lay it upon the boat seat. If I was on the ice I would lay it down on the ice.

Q. How long would it take you to get the samples, and before the ice was put around them, an hour?

A. I don't think as long as that. I don't think I was three-quarters of an hour at the outside.

Q. Did you take all those samples personally yourself?

A. Yes, sir.

Q. Every one of them?

A. All of them.

Q. Anyone assist you?

6661 A. No, I did the work myself; I had a man to haul the samples for me.

Q. I mean the physical act of getting the sample collected?

A. I did it myself.

Q. Did this fellow with you ever hold the stopper?

A. I couldn't say to that. He might possibly have had the stopper in his hand.

Q. Did you see him pick up the stopper and play with it in his hand?

A. I don't know whether he did or not; I wouldn't say that he did not; it would be an unusual thing if he did. He didn't bother with the business.

Q. You say it would be an unusual thing if he did?

A. Yes, I think so; he was there simply to haul the stuff.

Q. How often did you take these samples?

A. Once a week.

Q. Running through what period?

A. Oh, I don't know exactly, but along in the summer of 1899 and from that until the fall of next year.

Adjourned until 10:00 a. m., September 23, 1903.

6662 September 23rd, 1903. Parties met pursuant to adjournment, at 10:00 a. m.

Present, the Commissioner and same counsel representing the respective parties.

PROF. JOHN H. LONG,

called as a witness in behalf of the defendants, being first duly sworn by the Commissioner, was examined in chief by Mr. Todd and testified as follows:

Q. What is your name?

A. John H. Long.

Q. What is your business?

A. Teacher of chemistry, Northwestern University, Chicago.

Q. How long have you been connected with the Northwestern University?

A. Twenty-two years.

Q. What did you do prior to that?

A. For one year prior to that I taught;—the first year prior to that I taught in the Wesleyan University at Middletown, Connecticut, and for seven years prior to that I was
6663 engaged in the study of chemistry.

Q. At what institutions?

A. For four years, from 1873 to 1877, in the University of Kansas, and from 1877 to 1880 in the German Universities of Teubingen, Wuerzburg and Breslau.

Q. Where were you born, Professor?

A. Near Steubenville, Ohio.

Q. Have you held any positions in any scientific organizations or societies?

A. I am a member of a number of the American and foreign scientific societies and have been president of Section C of the American Association for the Advancement of Science; and at the present time I am president of the American Chemical Society.

Q. What is the American Chemical Society?

A. The American Chemical Society is an organization of American chemists, made up largely of professional men and teachers in the various institutions, and industrial chemists, with a membership of about 3,000.

Q. Are you the author of any books on the subject of chemistry?

A. I have written several books in general on analytical chemistry.

Q. Any other books?

A. These comprise all of the original publications that 6664 might be called books. I am translator of a large German work on optical chemistry.

Q. What branches of chemistry have you given special attention to in your studies?

A. My work has been mainly in the line of sanitary and medical or physiological chemistry.

Q. What do you mean when you employ the term "Sanitary chemistry?"

A. Well, I mean that kind of chemistry which has to do in a general way with the questions of public health. That is, examinations of water and air and milk and food supplies of all kinds.

Q. Have you had any connection with any of the boards of health in the state of Illinois or the cities of Illinois?

A. For a number of years I was chemist of the board of health of Chicago.

Q. When was that?

A. Between 1885 and 1890 or 1891, I have forgotten the last date. Since 1885 I have been chemist of the Illinois State Board of Health.

Q. What are the duties of the chemist of the State Board of Health?

A. The work which I have done for the Illinois State Board of Health, has been almost wholly in the line of water

6665 examinations. I have made in addition to these, some examinations of poisons for the board. The work has been very largely the examination of water.

Q. Have you made a special study of water analyses?

A. I have.

Q. When did you begin the study of water analysis?

A. Well, the subject of water analysis I took up while I was a student; but practically in an experimental way, after coming to Chicago, and in the summer of 1882 I made the first practical examinations.

Q. How long were you connected with the Board of Health of Chicago?

A. About five years.

Q. When did you begin work for the city?

A. My regular work for the City Board of Health began in the summer of 1885.

Q. What was the nature and character of the preliminary tests and investigations made by you of waters in Illinois?

A. The first examinations of water that I made in Illinois were in connection with the study of Lake Michigan beginning in 1882. I made numerous tests of the water from the various pumping stations, beginning with Evanston on the
6666 north, and Chicago avenue particularly, and later from the Hyde Park station. These first investigations were not official, but were taken up through my general interest in the question of the lake supply. I gave a portion of my time as instructor in the College of Liberal Arts of our institution at Evanston and there became acquainted with the varying conditions of Lake Michigan water, and was led to take up these investigations because of the very general complaints of the character of the water of that place, the supply being drawn from a point pretty near the shore. So, I began at that time rather an extended series of tests, carried on in the laboratory of my own motion. Later, some tests were made of the water taken at the city inlets I mention, particularly Chicago avenue and Hyde Park. This work was all preliminary to the work taken up by the City Board of Health in 1885. At that time the character of the water had become so altered here that an extended series of investigations was decided on and these were begun and continued for some years.

Q. You were acquainted with the condition of the Illinois and Michigan canal?

A. I was.

Q. When did your acquaintanceship with the Illinois and Michigan canal begin?

6667 A. As far back as 1883 or 1884,—I cannot give that date exactly, but a year or two before the beginning of these regular analyses. The difficulty with the lake water was recognized of course, as depending largely upon the water flowing out from the Chicago river, which in turn depended on the efficiency and flow in the canal; so I gave very early attention to the canal and to the sources of the water going into the canal.

Q. Are you acquainted with the history of the Illinois and Michigan canal?

A. Yes, in a general way.

Q. Do you know where the Illinois and Michigan canal begins and where it ends?

A. The Illinois and Michigan canal begins in a part of Chicago which is commonly described as Bridgeport. It begins at the pumping station which is very near the corner of Ashland avenue and 31st street, a little north of 31st street and a little east I believe, of Ashland avenue. It runs in a southwesterly direction connecting above Joliet with the Desplaines river; being led off again it follows down the north bank of the Illinois river to a point below LaSalle, where it connects with the river finally. This canal in a general way has been in operation since about 1850 or a little before, and was fed intermittently 6668 by pumps from the Chicago river, and to some extent by an old feeder known as the Sag feeder, the water being taken from the Calumet near Blue Island. This canal was so supplied for a good many years, until about 1866, the flow being small. Then it was decided to deepen it, enlarge it, and this was done about 1871, the work was completed about that time, the intention being to produce a gravity flow to carry over 30,000 cubic feet a minute,—30,000 to 35,000 cubic feet. This gravity flow began in 1871 and continued until after my examinations begun here, so I am familiar with those conditions, and continued until 1883 or 1884. By that time it became so filled with sediment that the flow was extremely uncertain. It very often did not exceed 10,000 cubic feet a minute, and with variations in the direction of the wind it was probably at times less than that, so that as a matter of fact the Chicago river was practically stagnant in those days. In 1884 as a consequence of the very general discussion and complaint of the people here, the present system of pumps was established at Bridgeport and these were intended to maintain a flow of fifty or sixty thousand cubic feet a minute. As a matter of fact the flow probably never reached 50,000 during the period in which they were operated. It is altogether likely that the flow did not average above 35,000 or 36,000. I speak of this because I several times went with committees of engineers and city officials to investigate the thing and we never could determine that the flow reached the volume which was claimed for it, so it is safe to say on the average it was much below 40,000 cubic feet all the time. 6669

MR. JEFFRIES: We move to strike out all the witness' answer to the last question and move to strike out the question as well with reference to the Illinois and Michigan canal for the reason that it is irrelevant, incompetent and immaterial and has no bearing upon any issue involved in this case and does not prove or tend to prove any issue involved.

MR. TODD: Where did the Bridgeport Pumping Works pump the water from that entered the Illinois and Michigan canal?

A. The Bridgeport Pumping Works pumped the water from the south fork of the Chicago river into the canal.

Q. When did the Bridgeport Pumping works begin operations?

MR. JEFFRIES: I object to the question for the same reasons stated in my motion to strike out the previous question and answer.

THE WITNESS: The present pumping system was begun in 1884.

6670 MR. TODD: What was the condition of the Chicago River at the time that the Bridgeport Pumping Works began operation in 1884?

A. The Chicago river at that time was extremely foul and practically stagnant for several reasons, which perhaps I ought to explain. In 1871 a systematic attempt was made to divert the sewage of the stock yards into the south fork. A large sewer which is known now as the Brennock sewer was constructed to drain from practically all of the packing houses and to divert and carry the water from those packing houses to the so-called stock yards slip. The amount of filth carried down in that sewer increased enormously for a number of years. Some years after 1871 a contract was given to Mr. John Brennock to take charge of that sewer and see that it was not allowed to clog up. The material was thrown out into the slip, and found its way, a good deal of it, into the river. Mr. Brennock carried that work on for some time as he was directed to do, but later put in a series of settling basins and wiers in the sewer unknown to the stock yards authorities. This is a matter of a great deal of importance as bearing on the amount of stuff which got into the river, so that I ought to explain the facts, as I am familiar with them personally. Mr. Brennock put in these series of settling basins and wiers, which he operated at night. He 6671 had a number of men who were employed by him privately, to take out an immense amount of grease and paunch waste, and practically everything which came out of the yards. To begin with, at the start nearly the whole of the stock yards sewage was discharged directly into the slip, but when his private system was brought into practical operation it took out the greater part of the solid waste. Later, when that fact was discovered, the packers themselves undertook to retain this stuff in or near their works by putting in similar systems. This of course would have a very considerable bearing on the amount of stuff that got away from the yards. In the early days very nearly the whole of that got into the slip and occasionally caused greater pollution than we have ever had since from the yards. From the days of Brennock to the present time there has been a gradual modification of the methods followed by the packers in discharging the filth into the river, so there has been a gradual decrease as shown by the various analyses which have been made at different times. By these wiers and settling basins it was possible, however, to retain only more or less insoluble and solid substances. Anything which passed into the sewers in a dissolved condition, extracted from the beef,—beef extract, escaped and finally got into the river. The amount of stuff

6672 which now escapes is largely of that character owing to the conditions improving from the days of Brennock to the present time. Practically the whole of the solid substances are removed, but when these pumping works were established that condition was not perfected and the river was foul very largely from the filth coming down in that way. Then another item of importance tending to foul the river and the lake is this: west of the city of Chicago is a small stream, small in dry weather, known as the Desplaines river. It drains a very large area and at times of wet season, at times of high water, the volume that comes down that river is very large. Ordinarily the stream flows southwest and enters finally the Illinois river, but in times of high water instead of taking that course a very large portion of it always overflows, or always did overflow, a low watershed west of the city and drained down into the Chicago river at a point near the Bridgeport Pumping Works. Within my own recollection I have seen hundreds of acres in the western part of the city flooded from that stream. Attempts were made on the part of the city to prevent that flow of water, and on the part of the land owners west, to increase the facilities in order to drain their land. As a matter of fact, on a great many occasions the dam at the head of the Ogden ditch, a name which is familiar to all of our old citizens of Chicago, was cut by the land owners permitting this flood of waters to
6673 go down and flow into the Chicago river and practically wash everything out into the lake. That was the case before 1884 and even after the establishment of the pumps it was frequently the case. When the Desplaines river overflowed its banks, or the dam was cut, there was a big flood of water coming down and entering there, sweeping everything into the lake. The pumps working at a maximum capacity in those days of 35,000 cubic feet per minute or 50,000 as was claimed, were quite inadequate to direct that flow of water, which, at times, flowed out into Lake Michigan unchecked, causing greater contamination. Those conditions were commonly known and recognized and discussed for several years.

MR. TODD: What other sewers emptied into the Chicago river except the ones you have described?

MR. JEFFRIES: At what time are you speaking of?

MR. TODD: From 1884?

A. The putting in of the pumping works and the stock yards sewer as far as the amount of filth discharged was of course most important. Further, two large sewers drained the same section of the city, the southern section. One is known as the Halsted Street sewer, which empties into the stock yards slip, which is north of the stock yards, approximately at the corner of 39th street and Halsted street, and another is
6674 known as the Western Avenue sewer, which in those days, however, drained a limited area, but which has since become a very important sewer. At that time another very important sewer was the 39th Street sewer which emptied also into the river. All of the west side was drained into the river in those days, and as at the present time, a large part of the south side and a large part of the north side also. Then, as now, in other sections of the north and south side most of the drainage was towards the lake. The sewer at 31st street and the big sewer at 22nd street discharged a very large volume of water into the lake.

Q. Are you acquainted with the gravity flow of the sewage system of Chicago?

A. In a general way, yes. Practically all of the sewers are gravity sewers. They were in the early days and are yet. Omitting a number of sewers which are pumped,—and they are few—practically the whole of the sewage is discharged by gravity and because of the general level condition of the city the flow is very slow and the sewage remains a long time in the sewers.

Q. Then what was the character of the water pumped by the Bridgeport Pumping Works into the Illinois and Michigan canal beginning in 1884 and down to 1900?

A. The water pumped into this canal was essentially the sewage of the city. The pumping works were practically
6675 adequate to counter-balance the tendency of the river to flow into the lake. In other words there was practically no current into the lake, so that the water pumped at Bridgeport corresponded to the sewage of the city.

Q. Are you acquainted with the history of the public agitation in regard to the contaminated water of Lake Michigan?

A. Yes, I have had some acquaintance with it from as far back as my residence in Chicago, since 1881.

Q. Are you acquainted with the work done by Dr. Rauch of the State Board of Health, and investigations made by him in regard to the studies of sanitary conditions existing?

A. I am.

Q. Who was Dr. Rauch?

A. Dr. Rauch was for many years, twelve to fifteen years at least, secretary of the State Board of Health, and a large part of his interest and activity was given to the subject of drainage of Chicago. He was one of the first of our Illinois men to take up the question of the disposal of the sewage in Chicago in some way, and suggestions which he made even before 1880, in the circulars and bulletins of the State Board of Health, were among the first and most important which led finally to a solution of the problem. His recommendations were practically followed in much of the subsequent engineering work.

6676 Q. Was the question involved in the sanitary condition of Chicago and its water supply, ever publicly discussed at any meetings?

A. Yes, it was the subject of very frequent discussion. Frequently in the meetings of the Chicago Academy of Science, for example, which I always attended, and took part in those discussions. They began even before 1885. This question was also discussed at the time of the first water-way convention, the large water-way convention, which was held in Peoria in 1887. While most of the formal addresses were given on the question of a deep water-way, the discussions in committees and the smaller bodies were very largely on the point of the disposal of the sewage of Chicago. I was a delegate to that convention and I was taken there at the instigation of Dr. Rauch, to be able to help to discuss that fact.

Q. Is Dr. Rauch living?

A. No sir, he is not. Dr. Rauch died seven or eight years ago. This general question of the disposal of the sewage of Chicago was discussed also at a very large meeting at Springfield in the following year,—1888. A meeting which was attended by health officers and sanitarians and public officials from all over the state. The meetings were held at the capitol building.

Q. Was there an organization known as the Citizens' Association?

A. At that time in Chicago, in those days, a voluntary organization known as the Citizens' Association, which
6677 was very active in stirring up discussion on these matters.

I was at one time, as early as 1884, employed by this association to make some examinations of the sewage coming from the stock yards and other points near the Bridgeport pumps. This association was perhaps a most important factor in crystalizing sentiment in favor of the Commission which was later established, known as the Hering Commission.

MR. JEFFRIES: I move to strike out all the evidence of this witness on the question of discussion of the pollution of the water in lake Michigan and the discharge of the sewage of Chicago for the reason that it is not competent evidence.

MR. TODD: In the meeting at Peoria, in 1887, what was the character of that meeting, and by whom was the meeting called?

A. That meeting was called by the people interested in the question of deep water-way from Chicago to the Mississippi River.

MR. JEFFRIES: I move to strike out the statement of the witness with reference to the meeting and also the questio because the answer shows upon its face that it has no beari upon the question involved in this controversy.

A. (Continuing) That convention was made up of delegates from all parts of the state of Illinois and adjacent states and cities.

Q. Were there any delegates at that convention from the state of Missouri or city of St. Louis?

6678 A. There were.

Q. Who were they?

A. Personally I remember the name of Mr. McMath.

MR. JEFFRIES: I object to that for the reason that it is not shown that the convention was held with legal authority.

We de not know whether it was held by some persons interested in the deep water-way, or whether it was held in the interests of some people financially, and for the further reason that it is not a subject which is involved in this controversy.

A. I met at that time delegates from a number of cities who were particularly interested in the question of sewage rather than the question of water-ways, as I said a little while ago, that question was, among many of these men, a prominent feature of the discussion. It was recognized that the construction of a water-way canal involved the disposition of the sewage of Chicago, so that that feature of the question received the greatest publicity in the discussion.

Q. Were there any other delegates to that convention except Mr. McMath of St. Louis, from the State of Missouri?

A. Yes, there were four or five other delegates from Missouri, and delegates from Iowa and delegates from several places farther down the river,—Tennessee.

6679 Q. Who was McMath?

A. Mr. McMath is an engineer of the city of St. Louis, who has had a great deal to do with water and sewerage systems of that place, and of considerable reputation, and his name has been known in connection, for years, with this work.

Q. After the Peoria convention, were the proceedings of the convention given publicity in the public press?

A. Yes sir, they were.

MR. JEFFRIES: I move to strike out the question and answer as incompetent and irrelevant.

MR. TODD: Do you know whether the public press of St. Louis gave any publicity to the convention at Peoria in 1887?

MR. JEFFRIES: I object to the question for the same reason.

A. I have not personally seen the St. Louis papers, but it is well known that the matter was discussed in them.

Q. When was the Hering Commission, so-called, appointed if you know?

MR. JEFFRIES: I object to the question unless it states the object and purpose of the Commission.

A. The Hering Commission was established as a result of this agitation for the improvement of the water supply of Chicago and the diversion of the sewage; agitation kept up for a number of years. It was established in 1886, or appointed at that time. It began work and continued through 1887 I believe. 6680

Q. Do you know what the condition of the lake and river was at this time which led to these investigations made by this commission?

MR. JEFFRIES: Objected to because the witness has already answered.

A. The lake water at that time, at periods of dry weather, was in general, fairly good. At the time of rain, however, when the discharge from the sewers into the lake was considerable and when the flow through the river was out instead of in, the water became, at the various pumping stations, more or less contaminated, noticeably contaminated. The river for that period was practically always bad and foul.

Q. Did you make any series of investigations of the water of the Illinois river, its tributaries, the Illinois and Michigan Canal, Lake Michigan, and the Chicago river, prior to the opening of the drainage canal in 1900?

A. Yes, I have made several series of those investigations. The first investigations were on the lake water to determine the fact of its increasing pollution, the water being taken from the Chicago Avenue tunnel and from the Evanston and Lakeview tunnels, and from the Hyde Park tunnel, the two longer tunnels not having been built at that time. The waters were
6681 taken from faucets connected with the city mains, and
were also taken by myself from the lake direct, at various times, to determine the general condition of the water at various distances from the shore, the object of all these investigations being to learn the facts of the condition of the lake with reference to increasing pollution. This work was done prior to any work which I took up on the Illinois river and canal.

Q. When did you make the first investigation? In what year?

A. You mean of the lake, in 1885 I began; the summer of 1885.

Q. What is the extent of the investigation?

A. That investigation included the examination of a great many samples of water from these stations that I have mentioned, weekly examinations carried on through a period of several months at each one of the stations.

Q. Have you those examinations?

A. I have not them with me, but they can be reached.

Q. When did you make the next examination?

A. The next examinations were concerned with the river and canal water, beginning at Bridgeport.

Q. When was that made?

A. That first series of investigations was started in 1886.

6682 Q. How extensive was that investigation?

A. That comprised a study of the water samples taken weekly at a number of points beginning at Bridgeport and continuing down the river to Peoria. It comprised examinations from Bridgeport, Lockport, Joliet, Ottawa and La Salle, to Peoria.

Q. How many samples of water did you analyze at each of those points?

A. The average number as I now recall it, was about twelve samples. They were not quite all the same number in 1886, between the beginning of the investigation and the early summer and fall. I have all the dates but I don't recall them. I didn't think they were essential.

Q. Have you the analytical data compiled from these analyses?

A. Yes I have in memoranda and reports, the results of those analyses.

Q. Have the results of those analyses in 1886, the summer of 1886 and the winter of 1886 and 1887 been published?

A. They have.

Q. Where have they been published, doctor?

A. They were published in the reports of the Illinois State Board of Health.

Q. Have you the reports of the Illinois State Board of Health?

A. I have parts of these reports.

6683 Q. Including these publications?

A. I have.

Q. When did you make your next investigation?

A. Following this first series in the summer and fall of 1886, I began a second series of experiments in the winter of 1886 and 1887, taking the colder months, beginning about the first of January, the end of December, 1886 to the first of January, 1887, and this series was continued through two or three months into March.

Q. At what points along the river?

A. These investigations were carried out at the same points between Bridgeport and Peoria.

Q. How many samples of water were analyzed at each point?

A. A smaller number than through the summer; as the period of investigation was shorter, the samples averaged six or seven I believe for each place. I can give the exact number by looking it up; I don't recall it now.

Q. Were the results of these examinations published and made a matter of record?

A. They were.

Q. Where?

A. In the same reports of the Illinois State Board of Health.

6684 Q. In the testimony of the different witnesses who testified for the State of Missouri in this case, reports from the Board of Health of the State of Illinois made by John H. Long were referred to ;are you the John H. Long who made those reports which were referred to by the witnesses?

A. I am.

Q. There is no other John H. Long in the Illinois State Board of health reports, is there?

A. No sir.

Q. When did you next make an investigation?

A. The next investigations were made two years later, beginning in 1888. I will give the exact dates on that. The summer of 1888.

Q. How extensive were the investigations in 1888?

A. In the summer of 1888 beginning with May 1st, and continuing into the fall and ending about the middle of November, I made along the river 650 chemical examinations, beginning with Bridgeport and including the same places included in the previous examination, but continuing below Peoria to the mouth of the river at Grafton.

Q. What points were included in the examinations of 1888. I would like to have you give all of the points?

A. I will have to refer for those to my data. I do not
6685 recall all of them. In 1888, during the period mentioned, May and the middle of November, samples were taken from Bridgeport, and Lockport, Joliet, Morris, Ottawa, La Salle, Henry, Peoria and Pekin, near the mouth of Copperas Creek in the Illinois river, Havana, Beardstown, near Pearl at the crossing of the Chicago & Alton railway, the Alton bridge as we call it, and Grafton. In that same investigation waters were taken from a number of the tributaries of the Illinois; from Dupage river which enters from the north from below Joliet; from the Kankakee river which enters from the south still farther down; from the Fox river which enters just above Ottawa; from the Big Vermillion river which enters from the south near La Salle, or a little above La Salle; from the Little Vermillion river which enters from the north near La Salle and from the Sangamon river which enters across from the town of Browning; enters from the opposite side of the river from Browning. Those were tributaries of the Illinois.

Q. Did you publish the results of your analyses in this investigation?

A. They were published.

Q. Where?

A. In the preliminary report of the State Board of Health, published and printed in 1889.

6686 Q. Did you make any subsequent investigations?

A. I did, but before going into that, I want to add a word of explanation about this preliminary report. This preliminary report was brought out by the Secretary of the State Board of Health for the use of some committee of the Springfield legislature in a very great hurry. The work of printing the report was begun but a few days after the completion of the last analyses, so that the work must be regarded only as of a preliminary character, and while the details were complete, the text and explanatory matter was comparatively meagre. The full report which was put in the hands of the secretary, in some way was lost and was never printed. The details are substantially completed here, but the report itself is not. That explanation is due the secretary of the State Board of Health, Dr. Rauch, and myself, to account for the peculiar character of this work. It was brought out in two or three days very hastily.

Q. The detailed analyses published in that report are correct are they not?

A. They are essentially correct as far as I could read the proof and correct the figures in the two or three days. The averages are practically all correct.

Q. When did you next make an investigation of the water in the Illinois river and its tributaries?

6687 A. The next investigation was of the sewer water in the neighborhood of Bridgeport. The intention of that investigation—

Q. Let me call your attention, Professor to this, did you not make an investigation in the winter?

A. Well, that should be mentioned as following this other. This investigation I have described was made in the late spring and summer and fall of 1888, and that was followed in the winter of 1888 and 1889, by another investigation, and the waters were collected at essentially the same points to determine the winter conditions of the river. I should have included them as one series.

Q. How many samples of water were analyzed in this investigation?

A. Ninety-six.

Q. Were the results of that series of analyses published?

A. They were.

Q. Where?

A. In the same report of the Illinois State Board of Health printed in 1889.

Q. Is that the so-called preliminary report to which you referred?

A. It is called a preliminary report.

6688 Q. Are the details and averages as published in that report correct?

A. They are essentially correct. The averages so far as I am able to determine by comparing with the originals are correct.

Q. When did you next make an investigation?

A. The next investigation was made in Chicago of the water in the neighborhood of Bridgeport pumps, in the winter of 1890 and 1891.

Q. At what points were the samples taken for this investigation?

A. The object of that investigation was to show the relative amounts of pollution coming from the stock yards and from the rest of the city. Therefore, samples were taken at points which would best show that. They were taken from the large sewers leading from the stock yards, and from the so-called Brennock sewer which I spoke of a little while ago, which enters the stock yards slip, very near Center Street, practically at Center Street; from the Ashland Avenue sewer which enters the south branch of this south fork some distance west of the stock yards slip, and from the Halsted Street sewer which enters the slip at Halsted Street just mentioned. Water was also taken from the 39th Street sewer, and from a point north of where the water is diverted from the main river, going
6689 to the Bridgeport pumps. Samples were marked "Main Street;" I cannot describe it more closely, but these samples included the bulk of the sewage, or represented the bulk of the sewage outside of the stock yards sewage.

Q. In the collection of the samples in the investigations heretofore made in 1886 to 1891, I wish you would take up each series of investigations and describe fully how the samples were collected and delivered and where analyses were made.

A. The samples through the series of 1886 were collected by Dr. Rauch of the State Board of Health,—secretary of the State Board of Health, through the health officers of various towns, which sent the samples. They were sent in jugs and and packed in boxes in sawdust or excelsior.

MR. JEFFRIES: I object to the witness testifying any further in reference to this question, for the reason that he doesn't know personally how the samples were taken, according to his own statement.

A. These samples were collected by Dr. Rauch as I explained, through his health officers, the directions for the collection being given by myself in a written or printed circular. Directions were given regarding the selection and cleansing of the jugs and the packing and corking of the jugs and the ship-

ping of them. In the first series of analyses in 1886,
6690 the water were sent to me at the laboratory of the old
Chicago Medical College, the institution now known as the Northwestern University Medical School, then located at the corner of 26th Street and Prairie Avenue in this city. The samples collected in the following fall investigation and winter investigation of 1886 and 1887 were collected by the same individuals mainly and collected in the same way, shipped in the same way and to the same place. The names of those collectors are given I think, in all cases in that report already referred to. In the series of analyses made in 1888, the same general method of collection, packing and shipping was followed, the samples being delivered however, to the laboratory of the Northwestern University School of Pharmacy, of which I had charge, the chemical laboratory, then located at 40 Dearborn Street in this city, being the southwest corner of Lake and Dearborn. The samples collected and analyzed through the winter of 1888 and 1889 were taken with the same authority, the Secretary of the State Board of Health and sent in the same way and analyzed at the same place, the College of Pharmacy, corner of Lake and Dearborn Streets. The collections through 1890 and 1891, of the sewer water, were made under my direction by methods suggested by myself, by employes of the Sanitary District
6691 of Chicago and were delivered to, and analyzed at the
laboratory last mentioned, being the laboratory of the College of Pharmacy, on the corner of Lake and Dearborn Streets.

6692 Q. In the analyses heretofore mentioned, from 1886 to
1890, what was the purpose of these investigations and analyses?

A. The purpose of these analyses was to show the effect of the discharge of the sewage from Chicago on the Illinois river.

Q. Will you describe in detail the method pursued by you in making these analyses and the significance of each chemical element which you discovered?

A. The analysis made of these waters was a so-called sanitary analysis, which embraced the determination of certain factors which are considered as important in showing the sanitary character of water.

The first of these is the determination of what is called the total solids of the water, that is the amount of solid substance left when a given volume of the water is evaporated to dryness in a platinum dish, and weighed. Generally for that determination 500 cubic centimeters or a liter was taken in this earlier work.

The determination of suspended matter was also made. That was made in two ways at different times. One method pursued was to evaporate some of the original water after thoroughly shaking it, and to evaporate also some of the same water after filtration through a very clean, pure Swedish filter paper, the suspended matter being left on the filter. The difference between the total solids obtained in the two determinations
6693 represents or shows the amount in suspension, or insoluble.

A number of determinations were also made by filtering some of the water through what is known as a Gooch crucible. The measured volume of the water was taken, allowed to settle somewhat, varying with the character of the water, and filtered through a Gooch crucible with light, porous asbestos bottom. When most of the water had passed through the sediment in the beaker in which the sample was allowed to settle to begin with, was poured on and washed through as a chemist washes a precipitate from a beaker in ordinary work of qualitative or quantitative analysis. This method was not always employed because while good, it was very much slower than the other, which was used finally, that is, filtering through the filter paper and making two determinations.

Third, a determination of nitrates or nitrogen in nitrates was made in these waters by a method then commonly followed by sanitarians. The evaporation of a measured volume of the water—a small volume of the water to a bulk of one or two cubic centimeters which was introduced into an instrument called a nitrometer, over mercury. The residue being brought into the instrument by the aid of some strong sulphuric

acid. In this instrument, because of a decomposition of the
nitrate, in the presence of the sulphuric acid and mercury
6694 oxide of nitrogen gas was liberated and measured. The
volume of that gas liberated being a measure of the
nitrate decomposed. That method was used before the introduction of the present simpler and more convenient methods.

The chlorine was determined in these samples by a standard method used commonly by chemists. In the more concentrated samples like the water from Bridgeport and Lockport, it was possible to make what we call a direct determination of the chlorine without previous concentration, there being enough chlorine present to be determined directly. In general I have always followed in these determinations what is known as the Volhard method in preference to a method very commonly used by sanitarians all over the country, an old method known as a chromate method.

Q. Describe the difference between those two methous, professor?

A. In the older chromate method the water, by sanitarians in general, is usually treated directly or titrated directly. A measured volume of the water is taken in a glass vessel, a flask or beaker; a few drops of potassium chromate which is called an indicator for this purpose, is added to the water and then from a measuring instrument called a burette, a standard solution of silver nitrate is run into the mixture until a certain color appears, which is due to the action of the nit-
6695 rate of silver with the chromate indicator just mentioned.
That indcates the end of the reaction or experiment, and the amount of silver nitrate used before this end comes is a measure of the chlorine in the water. Where this method is used directly on the waters low in chlorines the result, even with all of the refinements and modifications used, is too high, the ordinary eye not being sensitive enough to detect the point of the completion of the re-action, which often amounts to fifty per cent of the whole; in many cases it has amounted to over that. I therefore abandoned it as a method to be employed in water analysis for ordinary waters. I have used in preference to that the Volhard method, in which, if the water is strong in chlorine a direct titration can be made, adding first to the water

some nitric acid and then a ferric salt, preferably ferric sulphate, which is used here as the indicator. Then standard solution of silver nitrate, that is a solution of a definite strength containing a definite amount of silver nitrate which will therefore combine with a definite amount of chlorine, is added to this mixture,—that is to the water and the other things mentioned, —enough being added to more than combine with all of the chlorine present which point must be determined by some kind of a rough preliminary experiment. Then, after this
6696 excess of silver nitrate is added, the liquid is filtered from
the precipitate which forms—filtered into a clean vessel through good filter paper. The precipitate collected is washed with a little distilled water, and the excess of silver nitrate left in that liquid is measured by use of a second standard solution, —either a solution of ammonium thiocyanate or potassium thiocyanate. This solution measures the excess of silver used in the determination. The difference is the amount of silver which combines with the chlorine, and it is therefore a measure of the chlorine. That is the method which has been used in all of my late work, and as I recall, through most of the work here, —probably all.

Q. What other chemical elements did you make analyses of for the purpose of determination?

A. In these experiments I determined the so-called hardness of the water, that is the amount of certain salts of lime and magnesium in it, which decomposed soap solution, the hardness being determined by a well known simple method used by practically all analysts with the aid of a standard soap solution.

I determined further in all these waters, what is known as free ammonia, that is the ammonia which exists in the water either in the free, uncombined condition, or usually as a sort of ammonium or so-called saline ammonia. This am-
6697 monia can be liberated or driven off from water by
boiling under proper conditions a certain volume of it, with a solution of sodium carbonate; that is, with a weak alkali solution. For most of these tests a volume of 500 cubic centimeters was taken, except in the waters from the most highly contaminated points—Bridgeport, Lockport and Joliet, and perhaps a few others. Where the water is concentrated in

ammonia-furnishing material, it is necessary to start with a very much smaller volume, accurately measured, diluted with pure, distilled water, and carry on the distillation the same way. This ammonia is distilled free ammonia and is collected and measured by a method followed by chemists in general, which I do not believe needs any discussion, as there is practically the one method employed everywhere for that.

MR. JEFFRIES: We move to strike out all the evidence of this witness as to the means or manner used and employed in making the analyses of the water, for the reason that the witness has no personal knowledge or observation as to the correctness of the manner in which the samples were taken or as to whether they were taken according to instructions, and no other witness having testified, and no evidence having been offered showing that they were so taken in accordance with instructions, and therefore the testimony as to the results of such examination by the means described by the witness

6698 is valueless and does not constitute proper and competent evidence.

MR. TODD: In reply to the objection I will state that the experts at St. Louis in their testimony, adopted in part the conclusions of this witness, without giving the conclusions in their entirety, and for that reason as well as others, it makes this testimony competent.

MR. JEFFRIES: I move to strike out the objection or explanation of the counsel for the reason that it is argumentative and it should be more properly addressed to the court at the time of the hearing of the case.

Q. MR. TODD: Proceed, professor.

A. Following the determination of the so-called free ammonia, by a method used in general by chemists the next test was for what is known as albuminoid ammonia. Albuminoid ammonia is ammonia obtained by the distillation of a large number of nitrogenous organic bodies with a certain strong alkaline oxidizing solution known commonly as an alkaline permanganate solution. This solution is made up from a mixture of pure potassium permanganate and pure pottasium hydroxide in a manner which is in general followed by chemists with immaterial variations, and one suggested originally by an English chemist named Wanklyn. This ammonia is called albuminoid

ammonia because of the fact that the so-called protein or albuminous substances yield ammonia readily when dis-
6699 tilled in this way. Such bodies are types of those which yield ammonia by oxidation with alkaline permanganate solutions. The albuminoid ammonia determination as I make it, is made on the water after the distillation of the free ammonia, that is, on the water from which the free ammonia has been expelled.

Finally I made in these cases a determination of what is known as the oxygen consuming power or oxygen absorbing power of the water. The various organic substances commonly present in naturally pure or uncontaminated waters, undergo a destruction or alteration which may be called oxidation when they are boiled or treated in some way with certain standard oxidizing solutions, hence when a given volume of water is measured out and treated with an oxidizing reagent in certain amount,—a reagent of definite or known strength, and then after the boiling, the amount of this reagent left unchanged is determined, the difference, or the amount used up in the operation, is a measure of the oxygen given by the reagent to the substances in the water, which amount is commonly described by chemists as the oxygen consumption of the water.

The method which I have always followed in this determination is the so-called Kubel acid method. A measured volume of the water, usually 100 cubic centimeters is acidified with a small, definite volume of sulphuric acid—five
6700 cubic centimeters of about twenty per cent acid. The water is brought to the boiling point, being placed over a burner and heated to the boiling point and then a measured volume, known to be more than is required for the actual oxidation, of the standard solution I spoke of, which is a solution of potassium permanganate of known strength, is added to the hot water and the mixture is boiled a certain number of minutes. In all of my work the time is given in the reports as five minutes. At the end of this time the amount of this permanganate unacted on is measured by the aid of a second standard solution, that is a solution which combines with the permanganate solution and reduces it or uses up its oxygen very much as the organic matters in the waters do. By the aid of this solution we determine the residue of the permanganate and the dif-

ference shows that which the organic matter of the water used. This measures, in our usual terms, the oxygen consumption.

I want to add another word here. In all of my late analyses I have heated five minutes. I don't see here in the printed report at a glance whether it was five or a longer period. I want to be accurate about that. I will say that this is a method followed by a good many chemists and it is a standard recognized method.

All of these last measurements or tests are intended
6701 to measure what we call organic matter in the water, as
we are mainly concerned with these in arriving at the question of contamination or pollution of the water.

Q. Professor, did you make any determinations for the purposes of ascertaining the nitrites?

A. In these earlier tests no quantitative measurements were made and only occasionally qualitative measurements, for the reason that the accurate and delicate methods now used were scarcely known, or at any rate not commonly used at that time. The methods employed by water analysts were crude and not sufficiently delicate to be trustworthy. When I come to the later analyses I will tell about the nitrites.

Q. Will you state in detail how these results obtained by chemical analyses are interpreted by the chemists and what are their significance with reference to water?

A. From a sanitary standpoint the determination of total solids has ordinarily limited value, because in very good waters the total solids may be as low as, or less than 100 parts per million and may be as high as even a thousand parts per million, but if waters are known to furnish ordinarily, say 300 parts per million, and a new determination gives four or five hundred parts per million, it suggests an addition of some foreign or contaminating substance, so at times this test may
have importance, but ordinarily it does not have import-
6702 ance. The amount of suspended matter is a datum of im-
portance. Generally waters for household purposes should be practically free from suspended matters. Waters containing a large amount of suspended matter are unfit for household purposes, so we make this determination then to arrive at that condition. Nitrogen in its various forms is perhaps the most important element we have to deal with in water.

With few exceptions nitrogen is found in water as a result of the decay and decomposition and final oxidation of either animal or vegetable matter.

Nitrogen to begin with, comes mainly from the atmosphere and through the agency of plants it is taken up and fixed in plant tissue in more or less complex form. The plant dies and the substance decays. This nitrogen comes back into the soil or into the water and undergoes change there. The nitrogen compounds undergo decomposition, and the condition in which we find this nitrogen is in a way, an indication or measure of the stage of decomposition. Nitrogen of plants becomes, through the consumption of the plant by an animal nitrogen of the complex animal tissue, in time nearly the whole of it being built up in the animal body in the form of compounds known as the protein substances or albuminous 6703 substances or albuminoid—these various names are given.

Now in the metalbolism of the body, that is in the breaking down and elimination of the substances of the body, while most of the carbonaceous elements are given off from the lungs in the process of respiration, by far the larger part of the nitrogen is given off in an entirely different way, through the kidneys, with the urine in the form of two or three compounds, mainly, the most important of which are urea, and uric acid, creatine and creatinine, and this nitrogen so given off necessarily finds its way into the soil or into waters where it undergoes a series of changes, roughly described as oxidation. That is, these bodies that I have spoken of as coming from the breaking down of the animal tissue, when they reach the soil or water, undergo a further series of changes, and if these changes are not interrupted, the nitrogen is left finally in the form of free nitrogen gas, which goes back into the atmosphere or in the form of comparatively simple substances,—ammonia and oxidized bodies known as nitrites or nitrates, so it is important to determine then the condition in which this nitrogen is found, as measuring roughly the rate or stage of the destruction of the original matters from which it came. Now the nitrates represent as I say, one of the last stages in this decomposition 6704 of the nitrogenous bodies, and we therefore have the test for measuring the amounts of nitrate as a measure of the advance or the degree of the oxidation.

The chlorine is an extremely important element to be determined in most cases. Most natural waters contain very small amounts only of chlorine, this chlorine existing in the form of a chloride, usually sodium chloride, or common salt, and entering the water from the soil through which rain water percolates, to emerge finally as a spring or river or lake. Most soils do not contain much salt or chlorine, therefore the waters which percolate through these soils contain but small amounts, —usually but a few parts or even less than one part per million —from a fractional part up to perhaps eight or ten parts per million. Of course many soils may contain in certain regions near salt deposits, a much greater amount of that, but in speaking of ordinary soils it is safe to say that most of them furnish but a few parts per million of chlorine to water. In the disposition of the animal wastes of civilization, because civilized man everywhere uses comparatively large amounts of common salt, the excreted substances necessarily contain the salt, so that the determination of this element is roughly a measure of the salt excreta either by the urine or from the kitchen
6705 waste or from certain industries where salt is used, in the preparation of human food, for example. A very much smaller amount comes from the salt fed to cattle; so the determination of chlorine then in water, is always regarded by sanitarians as an important element, and also as a constant element. While nitrogen undergoes change, chlorine, being a mineral substance, is constant. It cannot be destroyed or lost. It is then an approximate measure of contamination of water by animal or household waste.

The hardness of water for sanitary purposes is important only within rather narrow limits; in my opinion, it is of very much greater importance in determining the technical value of the water, its use for making steam in boilers. In general we might say that very hard water is not very good for household use, but in the determinations made here, the question of hardness is not very important. There is no sufficient range here to have any importance.

The free ammonia determination is one of importance, because natural waters which have not come in contact with de-

composing nitrogenous matter anywhere, would not contain more than very minute traces of ammonia. Such traces perhaps might be taken up from the air, but in the breaking down of the body, protein or other substances or products eliminated from the body yield in one of the very first stages of their de-
6706 composition, ammonia, and in general in the decomposition of nitrogenous organic matters, whether they have come from the human body or from various industrial operations, free ammonia is one of the first products of decomposition to be recognized. It therefore becomes in a way a measure of the amount of this nitrogenous substance undergoing decompositon.

The ammonia which we recognize and describe as albuminoid ammonia is obtained from nitrogenous substances which have not been decomposed as far as to yield free ammonia. That is the albuminoid ammonia comes from bodies which are yet comparatively complex in their structure, and which have yet to undergo the main stages in decomposition and oxidation, so while the free ammonia is a measure of the comparatively advanced decomposition, the albuminoid ammonia is rather an indication of what is to be done yet with the nitrogenous substance which is to be broken down and oxidized.

The ogygen consumption is a rough measure of the amount of organic matter present. Nearly all the natural organic substances which can come from the breaking down of vegetable or animal tissues tend to take up oxygen, either directly or indirectly,—practically always directly. Many of them in water, through the aid of the minute plant organisms known as bacteria are gradually broken up and converted into products con-
6707 taining oxygen or in general what are called oxidized substances. Many of these bodies, if treated with an oxidizing agent,—something which will furnish oxygen, undergo a somewhat similar series of changes to that which would be brought about by the bacterial organisms if the organic matters were allowed to remain in the water; so that this oxygen consumption test then in a rough way, is a measure of the amount of substances to be still destroyed or oxidized, and it is considered as a test of some importance or value—considerable value.

Adjourned until 2:00 p. m., same day, Wednesday, September 23rd, 1903.

RECORD

The State of Missouri

vs.

The State of Illinois

and

Sanitary District of Chicago

VOL. 5

72

127
S.C

IN THE

Supreme Court of the United States

THE STATE OF MISSOURI
vs.
THE STATE OF ILLINOIS
and
THE SANITARY DISTRICT OF CHICAGO.

Original,
Docket No.

Before
FRANK S. BRIGHT,
Commissioner of the Supreme Court of the United States.

VOLUME 5.

VOLUME 5.

6708 2:00 p. m., Wednesday, September 23, 1903. Continuation pursuant to adjournment.

Present, the Commissioner and same counsel representing the respective parties.

JOHN E. THOME,

called as a witness in behalf of the defendants, being first duly sworn by the Commissioner, was examined in chief by Mr. Todd and testified as follows:

Q. What is your name?

A. John E. Thome.

Q. What is your business?

A. Mechanical engineer.

Q. Where are you employed?

A. At Washington Heights Pumping Station.

Q. Did you ever make any collections of water for the Sanitary District of Chicago?

A. I did.

Q. When did you make them?

A. About three years ago, I should judge; I have really forgotten the year—in 1889 I believe, somewhere around there.

Q. Did you make any in 1900?

A. Yes, there were some taken early in 1900.

6709 Q. At what point did you make the collections?

A. At the discharge of the Canal Pumping Station, about 300 feet west of the canal station probably.

Q. For whom did you make the collection?

A. For the Sanitary District. One sample to go to Chicago University, one to go to the laboratory at city hall and one to go, I believe, to Champaign.

Q. Where did you get the bottles that you collected the samples in?

A. They were delivered to me at the pumping station.

Q. By whom?

A. By a representative of Mr. Reynolds I believe.

Q. And you collected the water at that station?

A. Yes, sir.

Q. Where is that station located?

A. Ashland avenue and the old Illinois and Michigan canal.

Q. Is that what is known as the Bridgeport Pumping Station?

A. Yes, sir.

Q. How often did you take these samples?

A. Every Monday morning.

Q. Now, will you describe just exactly how you took these samples?

A. Why, I would take the bottle and submerge it with the cork in it; draw the cork, allow a little water to go in,
6710 then draw the bottle out and rinse it, replace the cork and submerge the bottle again, and draw the cork and let it fill.

Q. After you had filled the bottle, what did you do with them?

A. Sealed them.

Q. After you had sealed them what did you do?

A. Packed the small bottle in ice and the large one in excelsior.

Q. And then what did you do?

A. Tagged them for their destination, where they were assigned to.

Q. Where did you deliver them?

A. They were called for right from the station.

Q. By whom?

A. By one of Mr. Reynolds' employes, a milk inspector, I believe he was.

Q. What was his name, do you know?

A. No, I do not; he was a short, stout fellow; I could identify him, but I don't know his name.

Q. And you addressed the packages?

A. I addressed them, yes.

Q. And who were the packages addressed to?

A. One to go down to the city hall, one to the Chicago University, and the other one—I have forgotten the name
6711 now; I believe it was Champaign, Illinois.

Q. Prof. Palmer?

A. Yes, that's the name.

Q. I will show you a tag, sample number 1460, and ask you if that is in your handwriting?

A. Yes, sir.

Q. Did you place a tag similar to this tag, sample No. 1460, upon each of the samples you collected?

A. In every envelope.

Q. Did you make the proper memoranda upon the cards?

A. Yes, sir.

Q. The same as you did on this card?

A. Yes, sir.

Q. Did each card have written above in large type, "Streams Examination, Chicago Sanitary District, Sample No. ——, date, time, and where taken, collected by (with your name written in)?"

A. Yes, sir.

Q. Height of water, temperature of water, direction of wind, temperature of air, with instructions for taking the water printed on the back as in this case?

A. Yes, sir.

Q. This being sample No. 1460?

A. Yes, sir.

Q. And you attached a card similar to this to each one of 6712 the samples you collected and sent?

A. Yes, sir, it was enclosed in an envelope and sealed.

MR. TODD: I will ask to have the sample card, 1460, marked Sanitary District of Chicago's Exhibit 20 for identification.

Received and so marked by the Commissioner.

CROSS-EXAMINATION, by Mr. Jeffries.

Q. When did you say you commenced taking samples?

A. I couldn't say positively. I kept no record of the actual date.

Q. About how long a time did you take samples?

A. I think it was close onto a year.

Q. Continuously?

A. Yes, every Monday morning.

Q. And you took three different sets of samples each day?

A. Yes, sir.

Q. And these were taken out of the Chicago river?

A. Taken out of the Illinois and Michigan canal.

Q. How far from the Bridgeport pumps?

A. About 300 feet west.

Q. Did you take them off the bridge?

A. Yes, sir.

6713 Q. What particular place in the canal did you get them?

A. Off the riprap there.

Q. The edge of the canal?

A. Yes, we had an old flat-boat up there; we turned that up and laid down and reached out.

Q. Now, you say you first submerged the bottle under the water?

A. Yes, sir.

Q. And after it was partially filled, withdrew it from the water and rinsed the bottle?

A. Emptied the bottle, yes, sir.

Q. Then what did you do?

A. Put the cork in again and submerged it, and drew the cork and let it fill submerged.

Q. Did you put the cork back in the bottle while it was under water?

A. Yes, sir.

Q. Now, did you take the cork out before you submerged it to rinse the bottle?

A. No, sir, that cork was in there all the time.

Q. Both times?

A. Yes, sir, those were the instructions and they were very explicit.

6714 Q. Now, then, after the bottle had been withdrawn from the water and while you were shaking it or rinsing it, where was the cork or stopper?

A. Put that in the boat alongside of me.

Q. On this flat-boat?

A. Yes, sir.

Q. Just laid it down on the boat?

A. Laid it on the boat, yes.

Q. How long would it remain there, two or three minutes?

A. Probably that, probably less.

Q. It varied?

A. Yes, it all depended on the time to take to shake it out and rinse it.

Q. Now, how deep under the surface of the water did you put the bottle before you drew the stopper?

A. About fifteen inches, up to the elbow generally, the depth.

Q. Where did you get those bottles that you used?

A. They were delivered there by the collector of the water; they were delivered at the station.

Q. Were they packed when they were delivered?

A. They were in cases.

Q. Now, where did you take them and put the ice in them?

6715 A. We had the ice brought there, and I broke up the ice right there and I then filled the little can full of ice, that's all.

Q. How did you take these samples in the winter time?

A. The same way.

Q. It would be frozen over sometimes?

A. No, sir; not there; not with that current.

Q. Too much current to freeze?

A. Sixty thousand cubic feet a minute; it could hardly freeze.

Q. Now, did you bring them down to the City Hall yourself?

A. No, sir, they were called for from the station.

Q. How long did they remain there before they were called for?

A. Probably two hours. Two hours at the longest.

Q. They were all called for?

A. Yes, sir.

Q. You didn't express any of them to Champaign?

A. No, sir, I had no facilities for doing it at all.

Q. How many bottles were broken before you received them, during the whole time?

A. I don't know of any having been broken, but there were quite a few broken in taking the samples and lost.

6716 Q. You broke them yourself?

A. Yes, sir, before I got used to taking out the cork properly, and lost them.

Q. What did you do when you lost the bottles?

A. We had extra ones.

Q. You had them there with you all the time?

A. Yes, sir.

Q. Where did you keep those extra bottles?

A. In a locker about eighteen inches deep and four feet wide; I kept my clothes in that while I was at work.

Q. You kept these bottles in amongst your clothes?

A. Yes, sir.

Q. Just threw the bottles in on the clothes?

A. No, sir, sat them down on the floor and hung my clothes up.

Q. Were the bottles exposed to the air?

A. No, sir, they were always corked and sealed the way I got them.

Q. But the naked bottles were not in a case or anything?

A. Yes, they were in a case, in a regular case.

Q. In the box?

A. In a regular case.

Q. Were those cases closed or open?

A. All open on top.

6717 Q. Now, did you have any of the small bottles?

A. Sir?

Q. Did you take any samples in small bottles?

A. Yes, three small and three large bottles.

Q. They were all taken the same way?

A. All the same way, yes, sir.

Q. When you took samples in the small bottles, you rinsed them out in the same way?

A. The same thing, yes, sir.

Q. And you laid the cork up on the boat in the same way?

A. Yes, sir.

Q. And you packed those in ice?

A. The small bottles were packed in ice after being sealed.

Signature waived, F. S. B., Com'r.

6718 **PATRICK O'BRIEN,**

called as a witness in behalf of the defendants, being first duly sworn by the Commissioner, was examined in chief by Mr. Todd and testified as follows:

Q. What is your name?

A. Patrick O'Brien.

Q. Have you a middle name?

A. Patrick William O'Brien.

Q. Where do you live, Mr. O'Brien?

A. Lockport, Illinois.

Q. Mr. O'Brien did you ever collect water for the Sanitary District of Chicago?

A. Yes, sir.

Q. And for the State of Illinois?

A. Yes, sir.

Q. When did you collect water?

A. In 1900 and 1901.

Q. Did you collect any in 1899?

A. I don't really think I did.

Q. Did you collect any water in 1899?

A. Yes, sir, I did.

Q. Where did you collect the water from?

6719 A. The Illinois and Michigan Canal and the Desplaines river.

Q. Any other place?

A. No, sir.

Q. At what point did you collect it in the Desplaines river?

A. At about 100 feet north of what is called the River Bridge.

Q. Where is that River Bridge relative to the Beartrap dam?

A. About 1600 feet on the south.

Q. And where did you collect from the Illinois and Michigan Canal?

A. On Ninth street—between 9th and 10th street in Lockport.

Q. Did you collect any water from the drainage canal at Lockport?

A. No, sir.

Q. For whom did you collect this water?

A. Mr. Reynolds, Mr. Palmer and Mr. Jordan.

Q. Palmer of the University of Illinois, Reynolds of the Board of Health and Jordan of the Chicago University?

A. Yes, sir.

Q. Where did you get the bottles from that you collected the water in?

A. They were shipped to me at the United States Express Company's office.

Q. When you got the bottles in what condition were they?

6720 A. Sealed.

Q. Now, will you just tell how you collected the water after you got the bottles?

A. Yes. I submerged the bottle in the water, took my cork out, filled it partially full and rinsed the bottle; put the cork back in, submerged it under water about six inches and let it fill; put my cork back in and raised it up and sealed it again.

Q. After you did that, after sealing it, what did you do with the sample?

A. The bottles I packed in excelsior, the large bottles, and the small bottles I packed in ice.

Q. How many samples did you take each day?

A. Six.

Q. Did you put any card on the samples?

A. Yes, sir.

Q. I will show you a card, sample number 1018, and ask you if that is in your handwriting?

A. Yes, sir.

Q. Did each sample card have written at the top in large type "Streams Examination, Chicago Sanitary District, sample of water?"

A. Yes, sir.

Q. "Sample No. ——. Date, time, from place taken, collected by (with your name, P. W. O'Brien inserted,) tem-
6721 perature of water; temperature of air; height of water,
direction of wind, rain, remarks," similar to the card that I show you of sample No. 1018?

A. Yes, sir.

Q. Did you attach a card similar to this to each sample which you collected and sent to the different parties?

A. Yes, sir.

Q. Did each card have instructions for taking written or printed on the back the same as this?

A. Yes, sir.

Q. Now, after you had taken them out and put this card, or a card similar to this one I have, just shown to you, marked sample No. 1018, what did you do with the samples?

A. I took them to the express office and billed them out and sent them by express.

Q. How long from the time they were taken before you delivered them to the express office?

A. Possibly an hour.

MR. TODD: I will ask to have the card, sample No. 1018, marked Sanitary District of Chicago's Exhibit No. 21 for identification.

Said card so marked by the Commissioner.

6722 CROSS-EXAMINATION, by Mr. Jeffries.

Q. What is your business, Mr. O'Brien?

A. Teamster.

Q. How long have you lived in Chicago?

A. I haven't lived in Chicago at all, sir.

Q. You don't live in Chicago?

A. No, sir.

Q. Where do you live?

A. Lockport.

Q. How long have you lived in Lockport?

A. I was born and raised there, 39 years.

Q. When was it you took these samples of water at Lockport?

A. 1899 and 1900.

Q. How long did you continue to take them after you commenced?

A. About six months or such a matter.

Q. Anybody else take samples in connection with you?

A. My nephew.

Q. At the same time?

A. After I did.

Q. Did he take any samples while you were taking samples?

A. No, sir.

Q. Did he take any for you?

A. No, sir.

6723 Q. Did you take any for him?

A. Yes, sir.

Q. In fact, all the samples you took were for him?

A. I started and he finished.

Q. You started and he finished?

A. Yes, sir.

Q. Then while he was taking the samples under contract with the Sanitary District, you helped him out?

A. When I could, yes.

Q. How often did you take samples for him?

A. I never took them; I helped him pack and finish them if I had time.

Q. If you had time you went with him?

A. No, sir; if I had time I helped him pack the samples and finish them.

Q. You just helped him to pack the samples?

A. Yes, sir.

Q. You never collected samples for him?

A. Not for him, no, sir.

Q. Did you collect all of your samples?

A. All my own samples.

Q. Nobody at all collected for you?

A. No, sir.

Q. Nobody with you?

6724 A. No, sir.

Q. At what particular place in the canal did you get these samples?

A. Between Ninth and Tenth streets, Lockport.

Q. Was it in the side or in the center?

A. It was in the side.

Q. What did you go out on when you took them, or did you just stoop on the edge of the water?

A. I could stoop on the edge and reach out.

Q. How far out would you reach?

A. About two feet.

Q. Is that above or below the pumps?

A. No pumps in Lockport.

Q. How wide is the canal at that place?

A. Ninety feet.

Q. Where did you say you got these bottles?

A. United States Express office.

Q. At Lockport?

A. Yes, sir.

Q. How far is that from the place where the samples were taken or collected?

A. From where I collected the samples to the express office?

Q. Yes?

A. It was at that time about a block and a half.

6725 Q. Would you go to the express office and get the bottles?

A. Yes, sir.

Q. And carry them from there over to the place where you took the samples?

A. Took them right on my wagon.

Q. Now, you would stoop down and put the bottles in the water, would you, or would you first take the cork out?

A. Put them in the water first.

Q. When you got the water to rinse the bottles out, you left the cork in?

A. Yes, sir.

Q. You stooped down and put the bottle in the water?

A. Yes, sir.

Q. You drew it out and then you took the cork out?

A. Yes, sir.

Q. And you shook the bottles?

A. Yes, sir.

Q. And you poured the water out?

A. Yes, sir.

Q. And you put the bottle back in the water?

A. Yes, sir.

Q. Now, while you were taking the bottles and rinsing them out, where was the stopper?

A. In my hand.

6726 Q. Always?

A. Always.

Q. With those large bottles you would have to use both hands, wouldn't you?

A. No, sir.

Q. How many times did you lay the cork down or the stopper down on the side?

A. I never laid it down; I had instructions not to.

Q. You never did lay it down?

A. No, sir.

Q. At no time?

A. No, sir.

Q. Did you ever let any of these bottles get away from you?

A. No, sir, I never lost a bottle.

Q. When you submerged these large bottles, didn't you have to hold them with both hands under the water?

A. Yes, sir, both hands were under the water.

Q. Where did you hold the cork if you held the bottle with both hands?

A. In one hand under the water.

Q. You say you held the big bottle in both hands, also the cork in your hand?

A. Yes, sir.

6727 Q. How would you hold the bottle and remove the cork under the water?

A. By the neck, with my fingers.

Q. How close up to the neck would you get your hand?

A. Just so (indicating). I could get my hand away from the top of the bottle.

Q. That would be right around the top?

A. I would get it.

Q. The water would rush into the bottle from over the top of your hand?

A. When I was rinsing it out.

Q. And also when you would be filling it, the water would have to run over your hand to get into the bottle?

A. Not when I filled it.

Q. When you first removed the cork, because you had to hold the bottle around the top or the neck?

A. Yes, sir.

Q. Now, that is the way you held both the large and small bottle?

A. The small bottle was an easier bottle to handle.

Q. You had to hold it in that way?

A. The small bottle you could hold by the bottom.

Q. You sometimes held it—it was far easier to hold it by the neck, wasn't it?

6728 A. No sir, not the small bottle it ain't.

Q. Now after you took those bottles out of the water and put the corks in, where did you take them?

A. To the express office.

Q. Did you pack them before you took them there?

A. No sir I packed them right on my wagon, right there.

Q. What did you do in the winter when there was ice in the canal?

A. I had an ax with me and chopped a hole in the ice.

Q. And put your hand right down in the cold water?

A. Yes sir.

Q. When you cut a hole in the ice, which side of the hole would you stand on when you took the sample?

A. Stand on the outside.

Q. On the lower side?

A. Yes sir.

Q. Not on the upper side?

A. On the lower side.

Q. Now then, when you took the samples out of the running stream in the summer time, where would you put your hands in the water with reference to where you stood?

A. On the south side of the running of the stream.

Q. Below?

A. Yes sir.

6729 Q. Your body then would be up-stream and your hand down-stream?

A. Yes sir.

Q. And about six or eight inches from the shore?

A. Yes, two feet from the shore.

Q. Could you reach out two feet?

A. Yes sir.

Q. And get your hand down six or eight or ten inches?

A. Yes sir.

Q. How long is your arm?

A. Not very long.

Q. How close to the edge of the water would you get?

A. Right down to the water's edge. There is a stone wall there, sir.

Q. And the water runs level with the stone wall?

A. No sir, the water don't. It is a foot from the top of the wall.

Q. Didn't you have to lay down on the wall to get those samples?

A. Yes sir.

Q. Is that right?

A. Yes sir.

6730 RE-DIRECT-EXAMINATION,

By Mr. Todd.

Q. Mr. O'Brien, did you take any samples of water for Prof. John H. Long of the Northwestern Laboratory?

A. Yes sir.

Q. When did you take them?

A. During the time that I was taking these others.

Q. What kind of samples did you take?

A. A small and a large bottle.

Q. Where did you get the bottles from?

A. From the United States Express Company.

Q. Were they sent to you?

A. They were sent to me.

Q. And how did you fill them, the same way you did the others?

A. The same way as I did others.

Q. Now in taking them, what kind of a tag did you use?

A. I had a slip like that with envelope (pointing).

Q. I will ask you to look at the envelope and slip that I show you and state whether or not that is the kind of a slip, or a slip similar to that and an envelope similar to that was employed by you?

A. Similar to that, but that isn't one of my slips.

Q. But similar to that?

6731 A. Yes sir.

Q. The card and slip that I show you is marked State of Illinois Exhibit No. 11 for identification, and the card is marked 462, accompanying that exhibit. Now did you fill out a card similar to the one I show you with your name, place of collection, date of collection, temperature of water and air, and enclose it in an envelope like this and attach it to the sample of water which you took for Professor Long?

A. Yes sir.

MR. TODD: Let the record show that the card and envelope shown this witness are marked State of Illinois Exhibit No. 11 for identification.

RE-CROSS-EXAMINATION,

By Mr. Jeffries.

Q. Did you put the temperature of the water and the air on the cards?

A. Yes sir.

Q. Now when did you put that on the card with reference to the time you took the samples?

A. Right at the time I was taking it.

Q. You had the cards right there with you?

A. Yes sir.

Q. You put it on there then?

6732 A. Yes sir.

Q. You never carried it in your mind or put it on another piece of paper?

A. No sir.

Q. Did you ever forget your card?

A. No sir.

Q. You took these samples the same way you did these others that you spoke of, and at the same time?

A. Yes sir, at the same time.

Sig. waived. F. S. B., Com'r.

6733 PROF. JOHN H. LONG,

resumed the stand for further direct-examination by Mr. Todd, and testified as follows:

Q. Professor, what is the significance of chlorine in water?

A. Chlorine in water is found practically always in its commonest combination, sodium chloride or common salt. I think I explained this morning, that there is some amount, a small amount of this in all soils. Therefore rivers and lakes contain chlorine in that form, but it may be also a very important incidental constituent. The sewage contains the salt which is excreted in the urine, and the salt which comes from the ordinary kitchen waste, and the salt of various industries. I think I mentioned that. Now this salt is, inasmuch as it is an inorganic or mineral substance, in a very marked degree stable, and remains therefore, in the water. It does not undergo destruction or change. If it is found in the water in large amounts, above the amount found in waters of a region known to be uncontaminated, it is taken as an indication of a possible addition to the water of sewage in some form at some time. That is practically the significance of chlorine if found above a certain amount in mineral water or river water.

6734 Q. If chlorine is found in water and these other nitrogenous compounds of which you spoke are absent, what is the significance of its presence there?

A. It is simply a suggestion that possibly the water has received sewage of some kind.

Q. Necessarily sewage?

A. Not necessarily, because the water may have received drainage from a salt mine, or a salt well, so I say, it is a suggestion of the possible addition.

Q. Have you the table of analyses made by you in the summer of 1886?

A. Yes sir.

Q. I wish you would produce them, professor.

A. I have in this report of the proceedings of the Illinois State Board of health, the quarterly meeting at Chicago, October 28th and 29th, 1886, a table of results of examinations made at that time.

Q. Have you a table of averages drawn from those results?

A. I have. In this table of averages that I have here, there were but three determinations made in that year, 1886 -- free ammonia, albuminoid ammonia and the oxygen consumption. This table I have in two different forms. In the first re-

port the average of all the analyses was given. In the second, published along with the report, preliminary report as
6735 it is called, there is a table calculated from the individual experiments, leaving out certain ones, however, in order to include the sample taken in the same day; for instance, in the first table there are ten analyses at Bridgeport and only seven at Peoria. In calculating this table the averages are based on the same number of samples throughout. Therefore the fairer table to use would be this.

Q. The tables of analyses are found in these reports?

A. Yes sir.

Q. I wish you would read into the record the averages from the preliminary report, the one you say is a fair average.

MR. JEFFRIES: I object to the reading of the averages of such a table and such an examination, into the record, for the reason that there is no evidence to show that the samples of water of which the examination was made, were properly taken, and no evidence to show the manner in which they were taken, and therefore, such evidence would be incompetent, irrelevant and of no value.

MR. TODD: Just read that.

A. The results given are in parts per million.

Bridgeport.

Free ammonia,	26.563
Albuminoid ammonia,	1.633
Oxygen consumed,	26.20

6736 LOCKPORT, 29 miles below.

Free ammonia,	12.733
Albuminoid ammonia,	753
Oxygen consumed,	11.01

JOLIET, 33 miles below.

Free ammonia,	9.426
Albuminoid ammonia,	.432
Oxygen used,	9.34

OTTAWA, 81 miles below,

Free ammonia,	.413
Albuminoid ammonia,	.243
Oxygen consumed,	5.30

PEORIA, 159 miles below,

Free ammonia,	.027
Albuminoid ammonia,	.194
Oxygen used,	4.81

Q. Professor, will you give the page of the report of the Board of Health that table was taken from for identification?

A. That is taken from page XXVII of the preliminary report of the Illinois State Board of Health, published in 1889, by the authority of the State Board of Health.

Q. From those analyses professor, what conclusions do you draw?

A. These conclusions indicate beyond any question—

6737 MR. JEFFRIES: We object to any conclusions being drawn from these analyses for the reason, as heretofore stated, the results of the analyses are not shown to have been based upon samples of water properly taken or upon samples of water taken in any manner whatever.

A. These analyses show beyond any question a very marked destruction of organic matter in the flow between Bridgeport and Peoria, showing the effect of what is called bacterial oxidation in an extremely marked degree, the water at Peoria in that particular season being practically potable and actually used by a large number of the people. I was at Peoria during the season and observed that fact myself.

Q. That was in 1886?

A. That was in the summer of 1886. This effect is partly of course due to the oxidation and also to the dilution from tributaries, but the largest part of the effect is unquestionably due to actual destruction by bacterial oxidation.

Q. Have you the summaries for the winter of 1886 and 1887?

A. Yes sir, the summary for the winter of 1886 and 1887 is for four places, Bridgeport, Joliet, Ottawa and Peoria.

MR. JEFFRIES: Those summaries are objected to for the reasons heretofore stated. There is no evidence to show that the samples of water from which the examinations were made, were properly taken and no evidence of the particular 6738 place in the river or stream from which they were taken, and no evidence to show that the instructions given to the water-takers were carried out, and no evidence to show that any instructions were given in reference to the manner in which the samples were taken.

A. The analyses are expressed as before, in parts per million.

MR. TODD: Where are the tables you are reading from to be found?

A. This table is found in the same preliminary report on page XXIX, the figures being taken from a previous publication of the Board which I have not with me. These figures were published in a form similar to what I have here, but I have not a copy of that, but they are brought over into this report here.

Q. You made the summary yourself from your own analytical data?

A. Yes sir.

Q. Will you read the table into the record?

A. (Reading):

BRIDGEPORT,	
Free ammonia,	9.7
Albuminoid ammonia,	3.7
Oxygen consumed,	22.4
6739 JOLIET, 33 miles below.	
Free ammonia,	6.5
Albuminoid ammonia,	2.2
Oxygen consumed,	11.3
OTTAWA, 81 miles below.	
Free ammonia,	4.7
Albuminoid ammonia,	.75
Oxygen consumed,	9.0

PEORIA, 159 miles below.

Free ammonia,	1.7
Albuminoid ammonia	.43
Oxygen consumed,	6.45

Q. What conclusion do you draw from these averages for the winter of 1886 and 1887?

A. The conclusion that in the winter of 1886 and 1887, as in the summer of 1886, there is a very considerable destruction of organic matter in this stretch between Bridgeport and Peoria; but the destruction or oxidation is much less marked and characteristic than in the summer, as is always the case in these observations.

Q. Have you the summary for the summer of 1888?

A. I have.

Q. Where is the table of analyses to be found from which that summary is made, professor?

6740 A. The analyses from which this summary is taken are found in full in this book called "Preliminary report of the Illinois State Board of Health, published in 1889," and this summary is found on page 30 (Roman alphabet).

Q. Did you make that table of the analytical details, which you made at the time of the analyses?

A. I did.

Q. Will you read that?

MR. JEFFRIES: I object to that for the same reasons and I object to the introduction of the tables for the further reason that the tables themselves from which these samples were obtained, are the best evidence.

MR. TODD: Have you the tables there?

A. The tables are all in this book.

Q. Are those the tables from which this summary is made? And are they published in the report,—the preliminary report to the Illinois State Board of Health?

A. They are.

Q. Now will you indicate in the book which you hold and which has been denominated the Preliminary Report of the Water Supplies of Illinois and the pollution of its streams published in 1889 by authority of the Board of Health of the State

of Illinois, the pages where these tables appear, from
6741 which this summary that I ask you to read, and which
has not yet been read, appear?

A. The summary or mean of analysis given on page 30 (Roman notation) of this preliminary report, made up from results given in detail for Bridgeport, on page 10 of the report proper (Arabic notation). For Lockport on page 11; for Joliet on pages 12 and 13.

For Morris, on page 16,
For La Salle on pages 18 and 19,
For Henry, on page 21,
For Peoria on page 22,
For Pekin, page 24,
For Havana, page 25,
For Beardstown, on pages 26 and 27,
For Pearl, on page 27,
For Grafton, on page 28,
For Alton, on page 30.

MR. TODD: I offer the tables appearing on those pages as indicated in the preliminary report to the Illinois State Board of Health, as the State of Illinois Exhibit A for identification.

MR. JEFFRIES: That is, you offer the pages of the report?

MR. TODD: That includes these tables for identification.

MR. JEFFRIES: I object to the introduction and make
the same objection that I made to the summaries and
6742 tables heretofore read in evidence, and for the further
reason that the original tables are the best evidence.

A. This report is entitled "A Preliminary Report to the Illinois State Board of Health. Water Supplies of Illinois, and the Pollution of its Streams, by John H. Rauch, M. D., Secretary. With two appendices, first, Chemical Investigation of the Water Supplies of Illinois, by Prof. J. H. Long. Second, "The Illinois River Basin in its relations to Sanitary Engineering, by L. E. Cooley, C. E. Springfield, Illinois, H. W. Booker, Printer and Binder, 1889."

MR. TODD: Are the tables of analyses which you have just indicated in this preliminary report, true and correct tables of analyses made by you from the samples?

A. They are.

Q. Have you the summary made by yourself from those tables of analyses which are known as the State of Illinois Exhibit A for identification?

A. I have.

Q. Will you read that into the record, the table of averages?

A. The first table is entitled "Means of Analyses, May to October, inclusive, 1888." Results are expressed in parts per million, and are as follows: I also read table entitled "Means of Analyses During 1889." These tables follow each other.

6743

Table No. 1.

MEANS OF ANALYSES—MAY TO OCTOBER INCLUSIVE, 1888.

BRIDGEPORT.

Number of analyses,	29.	
Total solids,		471.2
Suspended matter,		129.20
Nitrogen in nitrates,		.000
Chlorine,		46.811
Hardness-$CaCO_3$,		201.3
Free ammonia,		12.253
Albuminoid ammonia,		2.558
Oxygen consumed,		23.113

LOCKPORT,

Number of analyses,	24.	
Total solids,		431.2
Suspended matter,		69.80
Nitrogen in nitrates,		.000
Chlorine,		46.120
Hardness-$CaCO_3$,		207.7
Free ammonia,		10.882
Albuminoid ammonia,		1.990
Oxygen consumed,		16.230

6744

JOLIET.

Number of analyses,	26.	
Total solids,		442.7
Suspended matter,		107.90
Nitrogen in nitrates,		.000
Chlorine,		43.658
Hardness-$CaCO_3$,		216.8
Free ammonia,		8.932
Albuminoid ammonia,		1.681
Oxygen consumed,		14.301

MORRIS.

Number of analyses,	24.	
Total solids,		355.9
Suspended matter,		30.85
Nitrogen in nitrates,		.380
Chlorine,		32.149
Hardness-$CaCO_3$,		214.8
Free ammonia,		4.107
Alb. Ammonia,		.707
Oxygen consumed,		10.920

6745

LA SALLE.

Number of analyses,	23.	
Total solids,		345.7
Suspended matter,		50.30
Nitrogen in nitrates,		1.037
Chlorine,		19.717
Hardness-$CaCO_3$,		211.7
Free ammonia,		.636
Alb. ammonia,		.526
Oxygen consumed,		8.558

HENRY.

Number of analyses,	19.	
Total solids,		306.0
Suspended matter,		27.50
Nitrogen in nitrates,		.683
Chlorine,		17.660

Hardness-$CaCO_3$,		202.4
Free ammonia,		.467
Alb. ammonia,		.481
Oxygen consumed,		8.657

6746 PEORIA.

Number of analyses,	19.	
Total solids,		329.75
Suspended matter,		54.27
Nitrogen in nitrates,		.8915
Chlorine,		12.358
Hardness-$CaCO_3$,		199.7
Free ammonia,		.210
Alb. ammonia,		.522
Oxygen consumed,		9.769

PEKIN.

Number of analyses,	16.	
Total solids,		353.0
Suspended matter,		84.30
Nitrogen in nitrates,		.795
Chlorine,		16.152
Hardness-$CaCO_3$,		204.6
Free ammonia,		.645
Alb. ammonia,		.650
Oxygen consumed,		9.410

6747 HAVANA.

Number of analyses,	25.	
Total solids,		301.78
Suspended matter,		45.4
Nitrogen in nitrates,		.731
Chlorine,		11.583
Hardness-$CaCO_3$,		204.2
Free ammonia,		.342
Alb. ammonia,		.430
Oxygen consumed,		8.142

BEARDSTOWN.

Number of analyses,	24.	
Total solids,		390.0
Suspended matter,		84.7
Nitrogen in nitrates,		.62
Chlorine,		7.524
Hardness-$CaCO_3$,		204.9
Free ammonia,		.202
Alb. ammonia,		.380
Oxygen consumed,		7.354

6748

GRAFTON.

Number of analyses,	12.	
Total solids,		301.6
Suspended matter,		50.3
Nitrogen in nitrates,		.582
Chlorine,		9.205
Hardness-$CaCO_3$,		242.4
Free ammonia,		.095
Alb. ammonia,		.483
Oxygen consumed,		7.300

ALTON.

Number of analyses,	15.	
Total solids,		278.6
Suspended matter,		75.2
Nitrogen in nitrates,		....
Chlorine,		4.083
Hardness-$CaCO_3$,		169.4
Free ammonia,		.166
Alb. ammonia,		.356
Oxygen consumed,		7.356

6749

TABLE NO. 2.

MEANS OF ANALYSES MADE DURING 1889.

BRIDGEPORT.

Number of analyses,	9.	
Total solids,		376.6

Suspended matter,	27.2
Nitrogen in nitrates,	0.00
Chlorines,	62.934
Hardness-$CaCO_3$,	....
Free ammonia,	8.925
Alb. ammonia,	2.806
Oxygen consumed,	26.502

LOCKPORT.

Number of analyses,	8.
Total solids,	408.6

Oxygen consumed,	7.562

6755 Q. What conclusions do you draw from those two tables of summaries, professor?

MR. JEFFRIES: I object to any conclusion being drawn from the tables, for the reason that there is no evidence showing that the samples from which the examinations were made were properly taken, or that any instructions were given for their taking, and there is no evidence to show that the results as contained in these tables are the results of any actual examinations made with respect to the water at the particular places at which they purport to have been taken.

MR. TODD: Proceed, Professor?

A. These results show a purification of the river between the source of the water at Bridgeport and the outlet of the Illinois river at Grafton. The purification measured by the destruction of organic matter, showed a very great or a very marked diminution of the organic matter. This diminution of the organic matter is due to two principal factors, the dilution of the stream by the water from various tributaries, and to the destruction of the organic matters by the oxidation, using that term in a general sense, or broad sense. The disappearance of organic matter is very much more marked than is the dilution as indicated by the change in chlorines, the condition being finally reached in which the organic matters are not larger
6756 or greater in amount than in the tributary streams.

MR. JEFFRIES: I object to the statement of the witness to the effect that the chemical conditions of the water are not different from that contained in the tributaries of the Illinois river for the reason that, so far as this witness is concerned, or any testimony that he has given, or any testimony in behalf of the Sanitary District, there is no evidence to show the chemical or sanitary conditions of the tributaries of the Illinois river, and for the further reason that the statement of the witness does not relate to any particular river or rivers that are tributary to the Illinois river.

A. (Continued.) And are not larger in amount than in the streams commonly found in that part of the country.

MR. JEFFRIES: I object to the last statement of the witness for the reason that there is no evidence to show that any examination has been made of the waters of any river other than that of the Illinois.

MR. TODD: Did you make, in connection with this investigation, any analyses of the waters of the tributaries of the Illinois river?

A. I did.

Q. Will you state at what points, and the rivers and give the analytical results of each stream that you examined?

6757 MR. JEFFRIES: I object for the reason that the question does not embody the method of the examination, or the precautions used in obtaining correct analyses of them.

A. I made at the same time that these analyses referred to were made, examinations of the waters of the DuPage river, the Kankakee river, the Fox river, the Big Vermillion river, the Little Vermillion river, the Sangamon river. That is all bearing on that.

MR. TODD: At what points on these rivers were samples taken, for these analyses of these different rivers?

A. For the DuPage river the water was taken a short distance above its mouth. It was shipped to me from Channahan.

Q. Who collected this water and how was it collected?

A. These samples were collected by the representatives of the State Board of Health, engaged by the Secretary of the Board, Dr. Rauch, and collected under the same conditions as were those previously described.

Q. Will you indicate the points where the samples were collected from each of the tributaries of the Illinois river at this time, the number of samples taken and analyzed by you?

MR. JEFFRIES: On the tributaries?

MR. TODD: On the tributaries.

MR. JEFFRIES: I object to it for the reason that t
6758 question does not embody, but does assume that the sa
ples were properly taken, and there is no evidence th
they were so taken, and no evidence as to the particular place
the respective rivers where the samples were taken, either in t
center or at the side, whether surface water or water benea
the surface, or whether water from below or above the sewa
discharge of any particular city upon the tributaries of the Il
nois river.

A. The water from the DuPage river was taken near Cha
nahan, near the mouth of the river. 21 samples were taken b
tween May and the end of September in 1888. All these we
taken that year. From the Kankakee river they were taken
Wilmington and were 19 in number. From the Fox river th
were taken at Ottawa and were 18 in number. From the B
Vermillion river they were taken near La Salle and were sev
in number. In the Little Vermillion river they were taken ne
LaSalle and were seven in number. The Big Vermillion riv
enters the Illinois river from the south, the mouth of it bei
above La Salle between two and three miles. The Little V
million river enters from the north, practically at La Sal
That is, on the same side of the river on which La Salle is s
uated, hence both samples are marked "La Salle." The sampl
from the Sangamon river were eight in number and were tak
near the mouth of the river at the town of Chandlervil
6759 These samples were taken in all cases near the mouth
the river and were intended to represent a composition
the tributary streams just before they enter the Illinois. Th
streams contained the sewage of towns or cities in all cases.

Q. Have you the table of analyses made by you from th
samples for the DuPage river?

A. I have. That table is found on page 14 (Arabic no
tion) of this preliminary report of John H. Rauch.

Q. Will you read that table in evidence?

MR. JEFFRIES: I object to the reading of the table
evidence for the reason that it does not show that the samp
from which examinations were made were properly taken; d
not show the manner in which they were taken, and for the f

ther reason that the original tables themselves are the best evidence, and for the further reason that it does not appear that the tables from which the witness proposes to testify represent correctly the original.

MR. TODD: Is the table for the DuPage river which you have on page 14 of the printed report which you hold in your hand, a true and correct table made by you of the analyses of the water of the DuPage river?

A. It is to the best of my belief.

MR. JEFFRIES: I object to the statement of the witness for the reason that the evidence shows that the table which
6760 he holds in his hand was not written by himself.

A. The table is as follows:

6761 TABLE NO. 3.

CHANNAHAN, DUPAGE RIVER.

MAY 4.

Total solids,	347.5
Suspended matter,	26.0
Nitrogen in nitrates,	.156
Chlorine,	31.150
Hardness, $CaCO_3$,	252.0
Free ammonia,	4.700
Alb. ammonia,	.925
Oxygen consumed,	8.000

Physical conditions: Slightly colored; clear; odorless.

MAY 11.

Total solids,	353.0
Suspended matter,	24.0
Nitrogen in nitrates,	.882
Chlorines,	8.250
Hardness, $CaCO_3$,	249.0
Free ammonia,	.689
Alb. ammonia,	.395
Oxygen consumed,	7.440

Physical condition: Nearly colorless; odorless.

6762 MAY 18.

Total solids,	322.9
Suspended matter,	16.0
Nitrogen in nitrates,	.315
Chlorine,	11.920
Hardness $CaCO_3$,	250.2
Free ammonia,	1.271
Alb. ammonia,	.394
Oxygen consumption,	7.600

Physical conditions: Colorless, slight earthy odor.

MAY 25.

Total solids,	372.8
Suspended matter,	62.3
Nitrogen in nitrates,	.441
Chlorine,	8.500
Hardness, $CaCO_3$,	276.0
Free ammonia,	.306
Alb. ammonia,	.614
Oxygen consumed,	8.640

Physical condition: Yellowish, earthy odor.

6763 JUNE 1ST.

Total solids,	322.5
Suspended matter,	31.7
Nitrogen in nitrates,	1.764
Chlorine,	7.788
Hardness-$CaCO_3$,	240.0
Free ammonia,	.534
Alb. ammonia,	.426
Oxygen consumed,	9.680

Physical conditions: Nearly clear; bad odor.

JUNE 8TH.

Total solids,	321.2
Suspended matter,	18.5
Nitrogen in nitrates,	.867
Chlorine,	7.080
Hardness-$CaCO_3$,	230.0

Free ammonia,	.405
Alb. ammonia,	.459
Oxygen consumed,	6.560

Physical conditions: Slightly turbid; yellowish and earthy odor.

6764

JUNE 15TH.

Total solids,	345.8
Suspended matter,	13.7
Nitrogen in nitrates,	.252
Chlorine,	19.116
Hardness-$CaCO_3$,	206.0
Free ammonia,	1.596
Alb. ammonia,	.402
Oxygen consumed,	8.480

Physical conditions: Slightly turbid, yellowish, earthy odor.

JUNE 22ND.

Total solids,	318.8
Suspended matter,	18.6
Nitrogen as nitrates,	trace.
Chlorine,	34.196
Hardness-$CaCO_3$,	226.0
Free ammonia,	4.230
Albuminoid,	.600
Oxygen consumed,	6.080

Physical conditions: Nearly clear; yellowish, earthy odor.

6765

JUNE 29TH.

Total solids,	305.0
Suspended matter,	23.9
Nitrogen in nitrates,	.693
Chlorine,	37.520
Hardness-$CaCO_3$,	222.0
Free ammonia,	4.870
Albuminoid ammonia,	.600
Oxygen consumed,	6.080

Physical conditions: Nearly clear; yellowish and earthy odor.

JULY 6.

Total solids,	418.4
Suspended matter,	11.7
Nitrogen in nitrates,	.315
Chlorine,	56.640
Hardness-$CaCO_3$,	216.0
Free ammonia,	9.580
Alb. ammonia,	.605
Oxygen consumed,	5.160

Physical conditions: Nearly clear, yellowish, and earthy odor.

6766 JULY 13.

Total solids,	317.0
Suspended matter,	17.3
Nitrogen in nitrates,	1.260
Chlorine,	9.204
Hardness-$CaCO_3$,	236.0
Free ammonia,	.670
Alb. ammonia,	.360
Oxygen consumed,	5.200

Physical conditions: Slightly opalescent, earthy odor.

JULY 20.

Total solids,	354.9
Suspended matter,	11.0
Nitrogen in nitrates,	trace.
Chlorine,	45.782
Hardness-$CaCO_3$,	218.0
Free ammonia,	7.180
Alb. ammonia,	.0770
Oxygen consumed,	7.120

Physical conditions: Clear; yellow; odorless.

6767 JULY 27.

Total solids,	389.0
Suspended matter,	10.5
Nitrogen in nitrates,	.240
Chlorine,	46.720

Hardness-$CaCO_3$,	218.0
Free ammonia,	5.020
Alb. ammonia,	.465
Oxygen consumed,	7.360

Physical conditions: Nearly clear; earthy odor.

AUGUST 3rd.

Total solids,	304.9
Suspended matter,	7.2
Nitrogen in nitrates,	trace.
Chlorine,	45.428
Hardness-$CaCO_3$,	184.0
Free ammonia,	7.520
Alb. ammonia,	.540
Oxygen consumed,	4.900

Physical conditions: Opalescent; yellow; earthy odor.

6768 AUGUST 10.

Total solids,	306.5
Suspended matter,	13.5
Nitrogen in nitrates,	trace.
Chlorine,	8.142
Hardness-$CaCO_3$,	260.0
Free ammonia,	.920
Alb. ammonia,	.520
Oxygen consumed,	4.320

Physical conditions: Opalescent; colorless; earthy odor.

AUGUST 17.

Total solids,	281.2
Suspended matter,	17.8
Nitrogen in nitrates,	.756
Chlorine,	1.532
Hardness-$CaCO_3$,	220.0
Free ammonia,	.400
Alb. ammonia,	.360
Oxygen consumed,	5.360

Physical conditions: Opalescent; yellow; earthy odor.

6769 AUGUST 24.

Total solids,	250.1
Suspended matter,	14.1
Nitrogen in nitrates,	trace.
Chlorine,	5.664
Hardness-$CaCO_3$,	220.0
Free ammonia,	.370
Alb. ammonia,	.330
Oxygen consumed,	4.800

Physical conditions: Opalescent; yellow; earthy odor.

AUGUST 31st.

Total solids,	284.1
Suspended matter,	11.6
Nitrogen in nitrates,	.200
Chlorine,	6.726
Hardness-$CaCO_3$,	250.0
Free ammonia,	.780
Alb. ammonia,	.420
Oxygen consumed,	5.120

Physical conditions: Slight opalescence; colorless; earthy odor.

6770 SEPTEMBER 7.

Total solids,	308.0
Suspended matter,	12.2
Nitrogen in nitrates,	1.197
Chlorine,	5.426
Hardness-$CaCO_3$,	254.0
Free ammonia,	.142
Alb. ammonia,	.234
Oxygen consumed,	5.200

Physical conditions: Slight opalescence; colorless; earthy odor.

SEPTEMBER 14.

Total solids,	308.0
Suspended matter,	14.5
Nitrogen in nitrates,	trace.

Chlorine,	6.761
Hardness-$CaCO_3$,	240.0
Free ammonia,	.134
Alb. ammonia,	.290
Oxygen consumed,	4.400

Physical conditions: Slight opalescence; colorless; earthy odor.

6771 SEPTEMBER, 21st.

Total solids,	325.0
Suspended matter,	15.5
Nitrogen in nitrates,	.....
Chlorine,	6.250
Hardness-$CaCO_3$,	270.0
Free ammonia,	.176
Alb. ammonia,	.266
Oxygen consumed,	4.000

Physical conditions: Clear; odorless.

*MEAN.

Total solids,	294.7
Suspended matter,	14.1
Nitrogen in nitrates,	.307
Chlorine,	5.786
Hardness-$CaCO_3$,	244.8
Free ammonia,	.417
Alb. ammonia,	.346
Oxygen consumed,	4.743

*Mean for last seven.

6772 Q. Have you the table of analyses made of the Kankakee river?

A. I have.

Q. Is that printed table in that report a true and correct copy of the table of analyses made by yourself?

A. It is to the best of my belief. It is found on page 15 of this same report (Arabic notation).

MR. JEFFRIES: I object to it for the same reason that I objected to the previous one.

MR. TODD: Will you read that table into the record?

MR. JEFFRIES: I object to that for the reasons heretofore stated.

A. The table is as follows:

6773 TABLE No. 4.

WILMINGTON, (KANKAKEE RIVER).

MAY 4th.

Total solids,	230.3
Suspended matter,	11.0
Nitrogen in nitrates,	.060
Chlorine,	1.180
Hardness,-$CaCO_3$,	165.6
Free ammonia,	.125
Alb. ammonia,	.660
Oxygen consumed,	11.600

Physical conditions: greenish color; clear and odorless.

MAY 11,

Total solids,	244.5
Suspended matter,	15.0
Nitrogen in nitrates,	.151
Chlorine,	1.270
Hardness-$CaCO_3$,	172.2
Free ammonia,	.103
Alb. ammonia,	.620
Oxygen consumed,	14.400

Physical conditions: Yellowish; clear and odorless.

MAY 18,

Total solids,	269.0
Suspended matter,	16.0
Nitrogen in nitrates,	.060
Chlorine,	1.530
Hardness-$CaCO_3$,	213.6
Free ammonia,	.076

Alb. ammonia,	.590
Oxygen consumed,	14.880

Physical conditions: Yellowish; clear; odorless.

MAY 25.

Total solids,	246.6
Suspended matter,	12.2
Nitrogen in nitrates,	6.
Chlorine,	1.160
Hardness-CaCO$_3$,	196.8
Free ammonia,	.044
Alb. ammonia,	.460
Oxygen consumed,	13.049

Physical conditions: Slightly colored; earthy odor.

6775 JUNE 1st.

Total solids,	422.2
Suspended matter,	274.0
Nitrogen in nitrates,	1.323
Chlorine,	1.180
Hardness-CaCO$_3$,	141.6
Free ammonia,	.100
Alb. amonia,	.784
Oxygen consumed,	19.520

Physical conditions: Muddy; odorless and nearly clear.

JUNE 8.

Total solids,	251.4
Suspended matter,	20.7
Nitrogen in nitrates,	.....
Chlorine,	1.065
Hardness-CaCO$_3$,	140.0
Free ammonia,	.093
Alb. ammonia,	.580
Oxygen consumed,	15.200

Physical conditions: Yellowish; earthy odor and nearly clear.

6776 JUNE 15.

Total solids,	253.0
Suspended matter,	16.2
Nitrogen in nitrates,	Trace,
Chlorine,	.708
Hardness-$CaCo_3$,	......
Free ammonia,	.077
Alb. ammonia,	.710
Oxygen consumed,	12.320

Physical conditions: Yellowish; earthy; slightly turbid.

JUNE 22nd.

Total solids,	271.4
Suspended matter,	19.2
Nitrogen in nitrates,	.....
Chlorine,	1.770
Hardness, $CaCO_3$,	218.0
Free ammonia,	.088
Alb. ammonia,	.702
Oxygen consumed,	15.480

Physical conditions: Yellowish; odorless.

6777 JULY 6th.

Total solids,	211.7
Suspended matter,	29.5
Nitrogen in nitrates,	Trace
Chlorine,	1.062
Hardness-$CaCO_3$,	146.0
Free ammonia,	.090

6783 Have you the table of analyses of the Fox river, the Little Vermillion, the Big Vermillion and the Sangamon?

A. I have these tables. I have the table for the Fox rive found on page 17 of this preliminary report, and the table fo the Big Vermillion river found on page 18, and the table for th Little Vermillion river being found on page 18, and the tabl for the Sangamon river being found on page 26 of this repor

Q. Are those tables correct printed copies of the tables mad by you in the analyses of the waters from those four respecti rivers?

MR. JEFFRIES: I object to the question for the reaso that the tables themselves are the best evidence.

A. They are to the best of my knowledge and belief at th present time.

Q. Will you read the tables for the Fox River, the Bi Vermillion, the Little Vermillion and Sangamon Rivers as foun in the preliminary report of the Illinois State Board of Healt in 1889, in this table you say you made?

MR. JEFFRIES: I object to the reading of the tables fo the same reasons as stated in the previous objection to the rea ing of the tables into the record, and for the further reason tha there is no evidence to show the condition of the weather an no evidence to show the condition of the waters of thos 6784 rivers with reference to local showers and freshets, an no evidence to show that the samples of water were pro erly taken, or the particular places in the river where taken, an no evidence to show the manner in which the examinations wer made and no evidence to show that they were taken all at th same time, or approximately at the same time. No evidence t show who took the samples, and therefore the tables so offere are not competent and legal evidence, and any comparison tha may be drawn therefrom or any argument that may arise ther from would be misleading and improper.

A. The tables are as follows:

6785

TABLE NO. 5.

OTTAWA, FOX RIVER.

MAY 14, 1888.

Total solids,	281.0
Suspended matter,	5.0

Nitrogen in nitrates,	.....
Chlorine,	3.19
Hardness, $CaCO_3$,	244.2
Free ammonia,	.079
Alb. ammonia,	.365
Oxygen consumed,	9.76

Physical conditions: Nearly clear; slight earthy odor.

Mean temperature week ending:	50.51
Total rain fall, week ending:	.81

MAY 21.

6808 Q. MR. TODD: Professor, from the summary of the analyses of 1888 based upon the analytical tables contained in State of Illinois Exhibit A, and the table of analyses of the DuPage, Kankakee, Fox,, Big Vermillion, Little Vermillion and Sangamon rivers, that have been introduced in evidence, will you state what conclusions you draw from this table of analyses of the tributaries of the Illinois river, and the table of averages from the analyses made by you for the different points along the Illinois river?

MR. JEFFRIES: I object to the question for the reason that any conclusions or comparisons that may be drawn from the exhibits introduced and the analyses so made, are misleading, erroneous, and have no value, because there is no evidence to show that the samples upon which the analyses are based, were properly taken; no evidence to show the manner in which they were taken; no evidence to show the particular place in the various rivers where taken, whether with reference to the surface or from underneath the surface of the water; no evidence to show the local conditions with reference to rains and freshets; no evidence showing that the samples were taken at the same time or approximately at the same time, and no evidence showing that all samples were taken under like circumstances, like conditions and in the same manner, or in such a manner that the samples so taken from the various rivers are compar-

6809 able with each other, on the various points from which samples were taken from the Illinois river and no evidence to show that any samples whatever were taken from the places named in the exhibit.

A. The consideration of these tables which have been referred to and given by me, and the comparison of the results of the analyses of the Illinois river at its mouth, with the results of the analyses of the tributaries of the Illinois, indicate that a condition of organic purification of the Illinois at its mouth, has been reached, which is comparable with or similar to that found in the tributaries mentioned. As indicated by the various tests which have been described, the organic matters in the Illinois river have been reduced to a point where they are not larger in general than the organic matters found in the several tributaries. They have been reduced to a point beyond which the destruction of organic matter in the river by natural means can not practically be exceeded or surpassed. Apparently the limit of oxidation of the organic matters has been reached. The practical limit of oxidation has been reached in the Illinois river, judging from these comparisons. We have here a condition in which the organic matters have been broken down and destroyed largely, and the residues that are left, not destroyed, are of a stable type, very resistent to all oxidizing influences.
6810 A condition characteristic of organic matter of vegetable rather than of animal origin, from which I conclude that in general these organic matters must be attributed to the leechings of the soil, that is to products of vegetable origin rather than to the products of animal origin.

Q. In what rivers does that condition obtain?

A. This condition obtains in all rivers to some extent and in the Illinois river at its mouth and its tributaries.

Q. How does the presence of organic matter in the tributaries of the Illinois river compare with the Illinois river itself during this period?

MR. JEFFRIES: I object to that for the same reasons stated in the previous objection,—to the witness drawing any conclusions from the exhibits just introduced, and an objection is here made to any other or further conclusions being drawn from such exhibits by this or any other witness.

A. The organic matter in the Illinois river at points far above its mouth, is in general larger than the organic matter in most of its tributaries, but by the time the mouth of the river has been reached, the organic matter has become so far reduced that it compares in general very closely with that found in the tributaries, and does not exceed that in the tributaries in general.

6811 Q. How does the Illinois river at Peoria, before it takes on the pollution from the city of Peoria, compare with the tributaries of the Illinois river above Peoria?

MR. JEFFRIES: I object to that for the same reasons.

A. In most of the examinations the condition of the water at upper Peoria or Averyville, as it is sometimes called, is very analagous to that of the tributaries. There is a purification of the organic matter there so that the water corresponds closely to the water of the tributaries.

MR. TODD: My questions are all directed to the period of these examinations and analyses. You understand that Professor, do you?

A. Yes sir.

Q. How does the water at Grafton in the Illinois river, compare with the water in the DuPage, Kankakee, Fox, Big and Little Vermillion and Sangamon rivers, professor,—

MR. JEFFRIES: Objected to for the same reasons.

A. The water of the Illinois river at Grafton in this season, in the summer of 1888, has reached a degree of organic purity fully equal to the mean condition of the waters in the tributaries mentioned, the DuPage, the Kankakee, the Fox, the Big and Little Vermillion and the Sangamon.

Q. Will you point out from the analyses, those chemical elements which lead you to that conclusion, and explain so that an intelligent layman might understand it?

6812 MR. JEFFRIES: I object to the question for the same reason. Whatever the conclusions or conditions may have been with reference to the particular examinations or analyses of the water they cannot be relied upon, and I object to this character of testimony as being uncertain and not competent proof.

A. In drawing this conclusion I have taken into consideration essentially these three factors, the amount of free ammonia, the amount of albuminoid ammonia and the figure representing the oxygen consumption. I have also considered the condition of oxidation as shown by the amount of nitrates, nitrogen in nitrates. There are four elements in reality going to make up this conclusion and by comparison of these four elements, it has been shown that the Illinois river has reached a condition of organic purity comparable with the tributaries.

Q. Professor, will you give a comparison of these three chemical elements which you have employed in formulating your opinion from the details, their amounts as they appear from the details in the tributaries and at the mouth of the Illinois river?

MR. JEFFRIES: I object to the question for the reasons heretofore stated.

THE WITNESS: Expressed in parts per million as be-
6813 fore, the free ammonia, albuminoid ammonia and the oxy-
gen consumption figure as follows:

For Grafton at the mouth of the Illinois river:

Free ammonia,	.095
Albuminoid ammonia,	.483
Oxygen consumption,	7.3

For Channahan, DuPage river, I will give the figure and explain it later:

Free ammonia,	.417
Albuminoid ammonia,	.346
Oxygen consumed,	4.7

Kankakee River:

Free ammonia,	.114
Albuminoid ammonia,	.585
Oxygen consumed,	12.661

Fox River, Ottawa:

Free ammonia,	.278
Albuminoid ammonia,	.463
Oxygen consumed,	7.066

Big Vermillion River:

Free ammonia,	.129
Albuminoid ammonia,	.341
Oxygen consumed,	6.914

	Little Vermillion river:	
6814	Free ammonia,	.180
	Albuminoid ammonia,	.411
	Oxygen consumed,	7.15

Sangamon River,	
Free ammonia,	.053
Albuminoid ammonia,	.285
Oxygen consumed,	5.48

6815 In giving the result for the Dupage River, I have taken the figures from this report given in the average, which is made up from the last seven results, for the reason explained in the text, that there was some uncertainty about the point of collection of the first samples, and therefore in making up this average, they were omitted. The other average represent the whole collection.

Now a consideration of these results shows in general that the factors representing the nitrogenous elements in the water and the factor representing the amount of oxygen consumed, are no greater for the Illinois river at its mouth than for the tributaries considered in the mean. In the case of the Kankakee the condition at the mouth of the Illinois is evidently better than that of the Kankakee river. The same is essentially true of the Fox river and it is also true of the Little Vermillion river. The average of all of these results from all the rivers will show a condition of organic impurity as great as that of the Illinois at its mouth.

In the breaking down of the vegetable organic matters in water and in the leaching out of the organic matters from soils into water, products are present which are comparatively stable, which tend to persist and resist the destructive influences of bacterial action in general more markedly than do those of animal origin. The characteristic nitrogenous substances
6816 excreted by the animal—urea, uric acid, hipuric acid—
undergo oxidation very much more readily than do the corresponding substances of vegetable origin. The more complex products of animal origin break down finally into substances of comparatively stable type, which do not use up very

much oxygen in the oxidation process. On the contrary the substances of vegetable origin use up much more oxygen—Perhaps I should qualify that. The substances of vegetable origin use up more oxygen than do those of animal origin which have been subjected to bacterial influences. While fresh substances of animal origin consume large amounts of oxygen, —the bodies of animal origin which have been in water a long time have reached a condition of disintegration, forming products of comparatively stable type. Among the substances of animal origin the nitrogenous derivatives are the most characteristic. Among the substances of vegetable origin the carbohydrates on the other hand are the most characteristic and these bodies are pre-eminently those which are characterized by the oxygen-consuming power. Particularly we have in vegetable extracts substances belonging to the lower carbo-hydrates, more particularly pentoses and pentosans, which while showing nothing by the nitrogen tests, give extremely marked and characteristic results in the oxygen consumption tests, and these bodies at the same time are markedly stable and account
6817 for the large figure for oxygen consumption in the vegetable extractives.

I will say these bodies and similar bodies. I mentioned the pentoses and pentosans, as illustrations of vegetable extractive substances; we have also bodies of the acid type, of which oxalic acid or oxalates and similar substances would be representatives. These bodies show marked oxygen consuming power, so that these facts I have taken into consideration in the statement which I made a while back, that the oxygen consuming power in the lower Illinois river corresponds practically to what we can expect from a water fed from the tributaries of the Illinois river, and can be fully accounted for by considering the tributaries and not the nitrogenous waste coming from the original sewage starting at Chicago.

Q. Professor, are you acquainted with the Illinois river and its tributaries?

A. I am.

Q. To what extent have you personal knowledge of the Illinois river and its tributaries?

A. I have seen the whole of the Illinois river by daylight on several occasions. I have gone from Bridgeport to Grafton in a small boat, a gasoline launch, by daylight, observing the whole of the river. I have started at Grafton and come 6818 up the river by daylight, as far as LaSalle, and have continued the trip several times by rail along the bank of the river. I have gone down the river also again from Chicago to Lockport and along the banks of the river to La Salle and from LaSalle or a point immediately below, known as Peru, to the mouth of the river. In addition to that I have visited several points on the river at numerous times.

I have been on the Desplaines river a great many times hunting and fishing, near the mouth, and further up. I have been on the DuPage river and have been up and down the Kankakee river from its mouth, practically to its source, in Northern Indiana. I have been on the Sangamon river at several points and have paid attention to the appearance of the water.

I have been also on the Vermillion river up to Streator which is some distance from its mouth—the Big Vermillion river. I have acquaintance with the Spoon river and the Little Vermillion river only by observation of points where they have entered the Illinois,—but the rivers mentioned are the principal tributaries so far as the waters are concerned.

Q. Are you acquainted with the Sangamon river?

A. I mentioned the Sangamon, which I have visited at Chandlerville, at Springfield and at Decatur, and also at its mouth, across from the town of Browning.

6819 Q. Have you personal knowledge of the sources of sewage contamination entering the Illinois river and its tributaries?

A. Yes, I have knowledge of this from an examination of many points along the Illinois river and the tributaries.

ADJOURNED until ten o'clock A. M., Thursday, September 24, 1903.

Chicago, Illinois.
6820 10:00 A. M., Thursday, September 24, 1903.
Continuation pursuant to adjournment.

Present, the Commissioner and same counsel representing the respective parties.

PROF. JOHN H. LONG,

resumed the stand for further direct-examination by Mr. Todd, and testified as follows:

Q. Professor, have you the table of analyses made by you in the winter of 1888 and 1889?

A. I have.

Q. You have already testified to where the analytical tables compiled by you for the summer of 1888 and 1889 appear in the preliminary report, have you Professor?

A. In the summer of 1888, yes.

Q. Professor, did you make examinations in the winter of 1888 and 1889?

A. I did.

Q. How many samples of water were taken?

A. Somewhat variable, but a mean eight or nine samples from each place.

Q. What places?

A. From Bridgeport, Lockport, Joliet, Morris, LaSalle,
6821 Henry, Peoria, Pekin, Havana, Beardstown, Grafton and Alton.

MR. JEFFRIES We object to the reading of these tables into the record or to this witness testifying to the result of the examination for the reason that there is no evidence showing the manner in which the samples of water were taken; no evidence showing the particulars of where taken; no evidence showing the condition of the water, with reference to local showers and freshets, or the stages of the water or the condition of the weather.

Q. MR. TODD: Where does the table of analyses appear?

A. In the State of Illinois Exhibit A for identification.

Q. Have you the summary made by you from these tables of analyses?

A. I have.

Q. Where is it?

A. It is in this preliminary report, page 30 with the Roman notation.

MR. JEFFRIES: We object to the summary being introduced for the reasons stated in the objections to similar testimony introduced yesterday, and for the reason that the original tables are the best evidence.

Q. MR. TODD: Is that the table that was read into the record yesterday by you, immediately following the table
6822 on the same page of the report from May to October, inclusive, 1888?

A. It is.

Q. From that table of analyses what conclusions, if any, do you draw?

MR. JEFFRIES: We object to the witness drawing any conclusions and we object to any conclusions being drawn from the tables for the reasons, first, that the original tables themselves are the best evidence; second, for the reason that there is no evidence showing what time or the manner in which the samples from which the examinations of water was made, and no evidence showing the condition of the river at the particular points where the samples were taken with reference to local showers and freshets, or the rise in the river, so that any conclusions that may be drawn would be misleading and unreliable, and therefore such testimony and such conclusions are of no value so far as the issues involved in this case are concerned.

A. This table giving the summary of the analyses made during the winter of 1888 and 1889, shows a considerable reduction of organic contamination of the water between Bridgeport and Grafton, but a very much less marked degree of reduction than was observed in the summer of 1888. This difference is particularly noticeable in the factor for the oxygen consumption, and for the albuminoid ammonia, and it is also shown by the factor expressing the amount of the free or saline
6823 ammonia present. One of the most important points in this table is found in the figures showing the amount of free ammonia, albuminoid ammonia, and the extent of oxygen consumption at Pekin during the winter. While in the summer work the amounts of organic matter in the river at Pekin as disclosed by the analyses does not appear to be excessive, at any rate no very great increase is detected there, during the winter of 1888-1889 these factors show, especially as regards the undecomposed nitrogenous substances indicated by the albuminoid ammonia, a very large residuant. The condition in-

dicated by the figures for oxygen consumption is also one of increased organic contamination. The explanation of this is not difficult and should be given here.

During the summer season in the stretch between Peoria and Pekin, which is a nearly level stretch of eight or ten miles in extent, an enormous decomposition of organic matter occurs, as is observable in passing through the stream. This decomposition is a bacterial or fermentive decomposition, as disclosed by the rapid evolution of gases in this part of the stream, so that roughly, this stretch may be compared to a great septic tank in which hundreds of tons of organic matter are undergoing decomposition all the time. The rate of decomposition of organic
matter varies as is well known, by temperature. In the
6824 winter season therefore, we have this rate very much
slower, so that at Pekin, below the distilleries and cattle sheds of Peoria, the enormous pollution as indicated by the residual albuminoid ammonia factor and the factor for oxygen consumption indicates fresh and recent additions.

MR. JEFFRIES: The statement made by the witness with reference to the discharge from the cattle sheds at Peoria is objected to for the reason that that condition relates to conditions existing in 1888 and 1889, while the evidence shows that there has been a great reduction in the number of cattle fed at that place since the opening of the Chicago Drainage Canal, as compared with the number fed prior thereto, and therefore any conclusions that may be drawn by this witness or any other witness, on that proposition is erroneous and misleading and absolutely irrelevant to the issues involved in this case.

A. (Continued) The consideration of these figures shows beyond any question whatever, that the addition of filth at Peoria is a very important factor in accounting for the organic matter in the river below.

Q. MR. TODD: You are confining your answer to the period of 1888 and 1889?

A. I am.

Q. And not to a date subsequent to that time, are you
6825 professor?

A. I am not.

MR. JEFFRIES: We move to strike out all that the witness said with reference to the filth deposits in the Illinois river at Peoria for the reason that the witness has not shown that he is acquainted with the conditions at Peoria, and the amount of deposits in the river at Peoria, and has not testified in reference thereto.

MR. TODD: Go ahead professor.

A. Another feature which must be referred to here is the high free and albuminoid ammonia as disclosed at Grafton, and the high oxygen consumption also. These figures,—this summary is made from the average of results given on page 28 Arabic notation, of the body of the report, and the individual examinations there show very great and considerable variations.

In the last of the examinations made in March of 1889, for some reason which I cannot explain now, the factors for free ammonia, for albuminoid ammonia and for oxygen consumption, were unusually high. The addition of these in making up the general average, as given on page 30, Roman notation—accounts for the relatively high figures given opposite Grafton,—figures higher than those given for the next town above,—Beardstown.

6826 It is evident from a consideration of the figures on page 28, Arabic notation, of the report, that at that time the river must have received at that point a very greatly increased contamination, possibly from the breaking up of ice and the washing down of accumulated filth. I have no data to show at the present moment how that could be accounted for. So, in resume, in consideration of this table while in general a reduction of organic matter appears during the colder season, it is markedly less than during the warmer summer weather before.

MR. JEFFRIES: Now in addition to what is contained in the objection to the conclusions of this witness, we move to strike out all of the answer for the reason that the conditions existing along the Illinois river in 1888 and 1889, were not the same a they have been since the opening of the Chicago Drainage Canal and we move to strike out all that was said with reference to the septic operation at and below Peoria, for the reason that the greater volume of water being discharged into the river by means of the drainage canal, has destroyed all septic operations at Peoria, or at any other place as shown by the evidence heretofore taken in this case,—if any such conditions existed in 1888 and 1889.

Q. MR. TODD: Professor, did you have any personal knowledge as to the condition of the sewage of Peoria during this period?

A. I had.

6827 Q. From what source did you get that knowledge?

A. From trips down the river at that time. I made several trips to Peoria during the period of these examinations, and between Peoria and Pekin.

Q. Have you read any of the testimony given by witnesses in this case at Peoria in regard to the sewage?

MR. JEFFRIES: We object to the question as incompetent, irrelevant and not a proper examination of the witness.

A. I have.

Q. MR. TODD: Whose testimony have you read?

MR. JEFFRIES: We object to the question for the further reason that whatever he might have read would be merely hearsay.

A. I have read the testimony given by Dr. Keiser, and Dr. Teichmann in their analyses.

Q. Of any other witnesses?

A. I do not recall any others.

Q. You heard the testimony of Dr. Keiser, did you not?

MR. JEFFRIES: Objected to as being incompetent and not the proper method of examination of this witness.

A. I did.

Q. Have you the table of analyses for the winter of 1890 and 1891?

6828 A. I have not, with me; those analyses were of the sewer waters discharged near Bridgeport, and were not published.

Q. Have you the summaries from those analyses?

A. I have a resume of these summaries in report form.

Q. Where is the resume to be found?

A. It is found in the report of the Illinois State Board of Health, published in 1901.

Q. By what authority?

A. By the authority of the State Board of Health of Illinois, published by the Secretary, page 67 of this report.

(Witness temporarily withdrawn).

6829 **JAMES M. QUINLAN,**

called as a witness in behalf of the defendants, being first duly sworn by the Commissioner, was examined in chief by Mr. Todd and testified as follows:

Q. What is your name?

A. James M. Quinlan.

Q. What is your business?

A. Clerk in the Law Department of the Sanitary District.

Q. Of Chicago?

A. Chicago.

Q. Mr. Quinlan, did you take any samples of water from the Kaw and Missouri rivers?

A. Yes.

Q. When did you take those samples?

A. On the 22nd, 23rd—and let's see, I made a note of them. I could not be positive as to the dates. It was May this year (referring to notes). Took them from the Kaw River on the 26th, 27th and 28th days of May.

Q. At what point on the Kaw?

A. Took them from the Kaw river about a mile and a half from Kansas City, Kansas, above the sewers, on the 26th, 27th and 28th days of May.

6830 Q. How many samples of water did you take?

A. From the Kaw?

Q. From the Kaw?

A. Took three on each day, making nine for those days.

Q. At what points on the Kaw did you take the three samples?

A. About a mile and a half above the Kansas City sewers.

Q. Were these three samples a cross-section?

A. Yes, one was taken fifty feet from the right bank: one from the center, and one fifty feet from the left bank.

Q. Who was with you when these samples were taken?

A. Frank Burke and two boatmen.

Q. How did you get up the Kaw?

A. In a boat, rowed up.

Q. This is Mr. Burke who is in the room at present?

A. Yes, the gentleman sitting behind me to the right.

Q. Where, in the Missouri river did you take samples?

A. Above the mouth of the Kaw river on the 22nd, 23rd and 25th of May.

Q. How far above the mouth of the Kaw on the Missouri river did you take these samples?

A. About a mile.

Q. Were there any sewers from Kansas City, Kansas, or Kansas City, Missouri emptying into the Misouri river above the point where you took the water?

6831 A. No.

Q. How may samples of water did you take daily from the Missouri river?

A. I took the same number.

Q. How did you take them?

A. Why, we had a gallon water bottle—

Q. No, in cross sections?

A. Oh yes, we took them fifty feet from each bank and one from the center.

Q. And where else did you take samples of water on the Missouri?

A. We took them up at the other end, that is, above.

Q. Above what?

A. Above the sewers at the other end of the town.

Q. Were these last samples that you have testified to taken above or below the sewers?

A. The last that we took was above the mouth of the Kaw in the Missouri river. You see we took them at both ends of the city.

Q. Yes, what I want to get at—just describe the two places on the Missouri river that you took samples of water?

A. Well, we took some about a mile below where the Kaw flows into the Missouri, then we took them up above, the other end of Kansas City.

6832 Q. On the Missouri river?

A. On the Missouri river.

Q. The ones that you took above the mouth of the Kaw on the Missouri river, was that above the sewage discharge from Kansas City?

A. Yes sir.

Q. In the Missouri river?

A. Yes.

Q. Did you take a cross section there?

A. Yes, fifty feet from each bank and one in the center.

Q. Now the ones that were taken below the mouth of the Kaw river, how far below the sewage discharge of Kansas City were these samples taken?

A. Well—in the Missouri?

Q. Yes?

A. About a mile and a half from the last sewer.

Q. Down the river?

A. Yes.

Q. How did you take those samples, in a cross-section?

A. Same manner, cross-section.

Q. How many samples did you take?

A. Took nine in all.

Q. Above and below?

A. Nine in each place, on the three separate days, we took three each day.

6833 Q. Will you describe now the manner that you empl[illegible]d in the collection of these samples of water at the three different places?

A. Why, we had a half gallon or gallon,—I am not positive which—gallon glass jars, and we would take the glass jar in our hand and dip below the surface of the water about a foot, after cleansing the jars with the water of the river, and cleansing the stoppers in the same manner, and as soon as we filled the bottle for that place, we would lift it up, put the stopper in and seal it.

Q. Where did you get these jars from?

A. Why, they were sent to us by Professor Long, through the Express company. We got them in Kansas City.

Q. In what condition did these bottles come to you?

A. As to what?

Q. Open or closed?

A. Closed.

Q. What kind of a cork did they have in them?

A. They had a ground glass stopper.

Q. When did you remove the stopper from these bottles?

A. Just at the time that we dipped them in the river, just prior to the time,—immediately before.

Q. Now after you dipped the bottles in the water, rinsed them and filled them the second time and corked them,

6834 what did you do?

A. We sealed them.

Q. In what manner?

A. Why we had a linen piece of cloth with rubber, a sort of a rubber veneer on it. We placed that over the stopper and then we used an ordinary wire and lead seal.

Q. After sealing it what did you do?

A. Why, we attached thereto a card describing when we had taken the waters and where we had taken them.

Q. Then what did you do with them?

A. Then we took them to the express company and shipped them to Professor Long at the Northwestern University.

Q. This same method you pursued in each one of the three places where samples were taken?

A. Yes sir.

Q. On the cards which you placed on the bottles, did you sign your name to it?

A. Yes.

Q. I will ask you to look at the cards that I hand you, 36 in number, and state whether or not those are the cards which you attached to the bottles of water which you collected from the three different points and sent to Professor Long at the Northwestern University Laboratory?

A. Yes sir, they are.

6835 Q. Did each one of those cards accompany the bottle of water which you collected and sent to Professor Long?

A. They did.

Q. After you shipped the 36 bottles of water as you have stated, did you see those bottles again after that?

A. Yes.

Q. When?

A. The day after our arrival at Chicago, on the 31st day of May.

Q. Where did you see them?

A. At Professor Long's laboratory.

Q. Did you see the bottles there?

A. Yes.

Q. Were the bottles which you saw there the identical bottles of water which you collected from the Kaw river and the Missouri river?

A. Yes.

Q. When you were in Kansas City, did you investigate the sewage out-falls of the city of Kansas City, Missouri?

A. Yes.

Q. Will you describe where those sewers from the city of Kansas City, Missouri emptied?

A. Why, they all emptied into the Missouri river above the place where we took this water. That is, there are two or
6836 three—but we took the samples about a mile above where they entered and then below where they all entered.

Q. How many sewers emptied into the Missouri river from Kansas City?

A. Well there are four large sewers.

Q. Did you make special investigation of that fact?

A. Yes, I saw them.

Q. Are there any other sewers in Kansas City except the sewers that empty into the Missouri river directly?

A. Why no; there is one, but it was not completed at the time we were there,—one in course of construction.

Q. Where was the outlet of that sewer?

A. Well that was into the Missouri, but not within the limits of the place where we took the water. It was to empty into the Missouri about eight or nine miles above Kansas City, Missouri, proper. It was to empty into what they call the Blue, it is a creek.

Q. Is that below or above Kansas City?

A. Well, it is above Kansas City, but I mean below the place where we took the water.

Q. Have you correctly described the locaton of that sewer, relative to the Missouri river?

A. Well this sewer, I didn't examine at all, but I am just telling what the City Engineer there told us they were 6837 doing with the sewer.

MR. JEFFRIES: I move to strike out everything that the witness has said the City Engineer told him.

Q. MR. TODD: This sewer was not completed?

A. It was not completed at all.

MR. JEFFRIES: We object to the witness testifying further in regard to this sewer, because his own statement shows that he doesn't know anything about it.

Q. MR. TODD: The sewers that you investigated did empty into the Missouri river?

MR. JEFFRIES: Objected to as leading.

A. Every sewer that was in operation emptied into the Missouri river.

Q. MR. TODD: These cards that you have identified, which one of the Kansas Cities do you have reference to Mr. Quinlan?

A. Kansas City, Missouri.

MR. JEFFRIES: I move to strike out all this witness has said with reference to the sewers of Kansas City discharging the sewage of Kansas City into the Missouri river, because it is incompetent, irrelevant and immaterial and has no bearing upon the issues involved in this case.

Q. Did the cards which you have identified, were they enclosed in an envelope?

6838 A. Yes sir, an envelope similar to that (pointing).

CROSS-EXAMINTION,

By Mr. Jeffries.

Q. How long were you in Kansas City?

A. About two weeks.

Q. At this particular time?

A. Yes sir.

Q. Do you know then of your own personal knowledge that there were four sewers emptying into the Missouri river?

A. I know that there are four; there may be some smaller ones, but I know of my personal knowledge that there are four; there may be more.

Q. Do you know of any sewers emptying into the cess-pools to the south of the town?

A. No, I do not.

Q. You didn't investigate that?

A. No. I investigated those that emptied into the Missouri.

Q. You don't know then what proportion of the sewage of Kansas City empties into the Missouri?

A. Yes sir.

Q. And what proportion empties into the cess-pools?

A. Yes sir.

6839 Q. You investigated that personally, did you?

A. There is a very small proportion—

Q. Did you investigate that personally?

A. Yes.

Q. You got the figures yourself, did you?

A. Yes.

Q. As to the amount?

A. Yes.

Q. Do you know where these cess-pools are?

A. Well I couldn't state exactly where they are.

Q. Well name the locations, how far from the city and in what particular part of the city?

A. I couldn't say that, but I can say that five-sixths of the sewage empties into the Missouri, and that was what I paid the most particular attention to.

Q. Well, answer the questions. You needn't talk until I ask you a question, and then answer the question.

MR. JEFFRIES: I move to strike out what the witness said as not being responsive to any question put to him.

MR. TODD: I object to the motion on the ground that the answer is responsive, and was elicited by the cross-examination of counsel.

Q. MR. JEFFRIES: Where are these sewers that empty into the Missouri river, located?

6840 A. The largest sewer that empties into the Missouri river and the main sewer is at Ohio Street—

MR. TODD: You mean Kansas City?

A. Kansas City, Missouri. What they call the Ohio Street sewer empties into the Missouri river at Ohio Street, and that conveys most of the sewage from Kansas City, Missouri the largest portion of it.

Q. Now what time of the year was it that you were in Kansas City, and what year?

A. May 23rd, we got there, about the 21st day of May, this present year.

Q. 1903?

A. 1903.

Q. And you left there when?

A. We left there about the 30th.

Q. What was the stage of the Kaw river at that time?

A. We didn't take any stages of the Kaw.

Q. Was it before or after the flood?

A. It was before.

Q. How long before?

A. About ten days.

Q. The river was very high at that time though, was it not?

A. Not very high for that time of the year, about ordinary condition for that time of the year.

6841 Q. Oh, you were acquainted with the river prior to that time, were you?

A. Yes.

Q. What was the extent of your acquaintance with the river?

A. Well, I can't say that I was, but I made inquiries from the natives there—

Q. I am talking about your knowledge.

A. No, never was up and down the river and examined it before.

Q. Were you ever in Kansas City before?

A. Yes.

Q. Never was up and down the river before?

A. No. But you could see that the river was not extra high.

Q. Now you took two sizes of bottles, did you—samples in two sizes of bottles, a small and a large?

A. No, one size.

Q. Large bottle?

A. Large.

Q. You didn't pack them in ice or anything?

A. No sir.

Q. Did you hold the stopper under the water while the bottle was being filled?

6842 A. No sir.

Q. You held it in your hand?

A. Yes.

Q. Where was the stopper when the bottles were being rinsed, when you would rinse the bottles?

A. Held it in my hand.

Q. You held it in your hand all the time?

A. Yes.

Q. What express company did you take them to to ship them to Chicago?

A. United States.

RE-DIRECT-EXAMINATION,

By Mr. Todd.

Q. You say you knew the proportion of the sewage emptying into the Missouri river through these sewers. Will you state it?

A. Well, it was about five-sixths.

Sig. Waived.

F. S. B., Com'r.

6843 **FRANK C. BURKE,**

called as a witness in behalf of the defendants, being first duly sworn was examined in chief by Mr. Todd and testified as follows:

Q. What is your name?

A. Frank C. Burke.

Q. What is your business Mr. Burke?

A. I am in the teaming business at the present time.

Q. Did you go to Kansas City with Mr. Quinlan?

A. Yes sir.

Q. Did you collect any samples of water from the Kaw River?

A. Yes sir.

Q. And Missouri river?

A. Yes sir.

Q. At what points did you collect samples from the Kaw and the Missouri?

A. From the Kaw river we collected samples about a mile and a half above Kansas City, Kansas, sewers, up above Argentine.

Q. On what river?

A. On the Kaw river. In the Missouri river we collected samples from about a mile or a mile and a half above the mouth of the Kaw, where the Kaw empties into the Missouri. We collected samples just below the mouth of the Kaw, between
6844 what they call the Ohio Avenue sewer, or the Ohio Street
sewer, and the mouth of the Kaw and the Missouri, and we collected samples below Kansas City, Missouri, city limits.

Q. Describe where you got the bottles from and how you collected the water?

A. We got the bottles from the United Express Company. They were sent to us. Some of them were sent to us, I believe it is, from the Northwestern University, where Professor Long is, and some of them were sent to us from the laboratory of the city Hall, we got them from the express office. We had them sent to the hotel. We went down and investigated the river and went along and located the sewers as near as possible and then we started in to collect water samples.

Q. Well, just describe how you collected them?

A. Well, we secured boatmen in the Missouri river and rowed up above the mouth of the Kaw, up between the mouth of the Kaw and the Quanderro, as near as I could judge, and we collected—first when we started to collect the water, we took and rinsed our bottles and washed our corks. Do you want the manner described, in which we took the water?

Q. Yes, state just how you did it.

A. We took our coats off. It was quite warm, and tucked up our sleeves and dipped the bottles down as deep as we possibly could, in the water.

6845 Q. How deep was that?

A. Well, I cannot estimate just how deep it would be. It was as far as we could reach out of the boat you know. I should judge possibly we would get a foot and a half under the water, something like that. Then afterwards we would take the bottle out and we immediately sealed it and placed our cards in the envelope. Then we took it in cross-sections. Went to the center of the river and then to the other side, fifty feet from the right bank, and we did that in every place that we took the water.

Q. How many places did you take the water?

A. In the Missouri river we took it at three different places.

Q. And one place on the Kaw river?

A. One place on the Kaw river, yes sir.

Q. After you took the water and sealed it, what did you do with it?

A. We took it back to the hotel and when we had collected all our water we expressed it to Professor Long at the Northwestern University.

Q. You expressed 36 bottles to Professor Long?

A. Yes sir.

Q. After you arrived in Chicago did you see those bottles?

A. Yes sir.

6846 Q. Where?

A. At Professor Long's Laboratory.

Q. Are those bottles that you saw in Professor Long's laboratory, were they the identical bottles you collected from those four different places?

A. Yes sir.

Q. I will show you 36 cards and ask you if those are the cards which you placed on each one of the bottles?

A. Yes sir.

Q. Did you investigate the sewage out-falls at Kansas City?

A. I don't quite understand that question.

Q. Did you investigate the sewage out-falls of Kansas City, the sewers?

MR. JEFFRIES: I object to the question for the reason that it is incompetent, irrelevant and immaterial and for the reason that the fact that the sewage is discharged into the Missouri river by Kansas City, has no bearing on the issues involved in this case and such fact does not justify the Sanitary District of Chicago in sending its sewage down the Illinois river.

Q. (Question repeated)?

A. Well, we investigated the different sewers that emptied into the Missouri river as far as we could do so.

6847 Q. How many sewers did you find emptying into the Missouri river?

A. We found four large sewers.

MR. TODD: I offer those 36 cards in evidence.

MR. JEFFRIES: To the introductin of this we object for the reason that such evidence is incompetet, irrelevant and immaterial.

THE COMMISSIONER: The cards are marked Defendant's Exhibit 2.

Not reproduced.

CROSS-EXAMINATION,

By Mr. Jeffries.

Q. What is your business?

A. I am in the teaming business.

Q. Do you know what Mr. Quinlan's business is,—the man who testified just before you did?

A. I understand he is connected with the Sanitary District.

Q. Mr. Todd's clerk, isn't he?

A. I don't know. I know he is connected with the Sanitary District and that's all; I don't know what their official positions are.

MR. TODD: He is a clerk in the law department of the Sanitary District of Chicago.

6848 MR. DRENNAN: He testified to that. He said he was a clerk in the law department of the Sanitary District.

Q. MR. JEFFRIES: Were you ever in Kansas City before this time?

A. No sir.

Q. You don't know anything about the stage of the water in the Kaw and Missouri rivers at that time, as compared with what it was at previous times?

A. With the exception of the report which we got from, I think, the Government office there; that is, on the Missouri river. They take the stagings of the Misouri river each day. I don't believe they take any stagings of the Kaw river.

Q. You say you think you got it from the government?

A. I am certain we got it.

Sig. waived.
F. S. B., Com'r.

6849 **PROF. JOHN H. LONG,**

resumed the stand for further direct-examination by Mr. Todd, and testified as follows:

Q. Have you made any examinations of the sewers of Chicago, and the discharges from those sewers, and if so when, and for what periods did the investigation relate to?

A. I made on several occasions, examinations of the sewers in the neighborhood of Bridgeport and south of Bridgeport. First in 1886 and later in 1890 and 1891. The winter of 1890—and 1891, I made more extended investigations to determine if possible, the proportions of organic matter discharged from the sewers of the city and from the stock yards, and the amount of this which passed the pumps at Bridgeport.

Q. When was this investigation made?

A. The first investigation in 1886 was made for the Citizen's Association; the time of year I cannot give you now, and it was concerned mainly with what I spoke of yesterday, as the large Brennock sewer, carrying the bulk of the stock yards sewage at that time. The amount determined then was equivalent to about 112 tons daily of dry, organic matter.

Q. Give the dates of the last examinations?

A. In the winter of 1890 and 1891. I made altogether 6850 about 130—I cannot give the number exactly, but about 130 examinations of water from the various sewers. This water was collected daily through a considerable period, at fifteen minute intervals. The collections were united in large hogsheads, thoroughly sampled and brought to me each day for analysis by employes of the engineering department of the Sanitary District of Chicago, the method of collection being suggested by myself. Analyses were made of these waters to determine the total organic matter as accurately as possible, and also the nitrogen from which a calculation was subsequently made. The results of these investigations were never published and at the preset time I am not able to find the averages which I made, but the figures from which I quote here were made when I had those averages in my possession some years ago. They have been mislaid since. These figures are important as showing as accurately as I could determine at that time the amounts of organic matter.

MR. JEFFRIES: I object to any statement by the witness of the amounts and the results of the examination, for the reason that the witness has no correct information with him with reference to the actual results of such examination that would make competent and legal proof or evidence, and for the reason that the original tables are the best evidence.

MR. TODD: Professor, the facts which you are about to
6851 detail you know of your own personal knowledge are correct?

A. I do.

MR. JEFFRIES: I object to the question and answer for the reason that the witness has not shown that he made any comparison between those before him and those contained in the original sheets; that the witness is now reading from a printed report of such examination, and also for the reason that the witness stated that the information he now has before him was furnished by assistants in his office.

MR. TODD: You state from what facts you are about to detail, are compiled from and by whom made?

A. These facts were obtained by myself in the analyses of the samples of sewer water collected in the year 1890-1891, the winter of 1890-1891. The original analyses I still have, but the memoranda which I have not, are memoranda of the flow in the sewers, which would be necessary to calculate the amount for 24 hours, but before those memoranda were mislaid the statement I have here was made and I vouch for the correctness of that statement.

Q. Made by whom?

A. By myself.

Q. Proceed?

A. I found at that time that the organic matter which was
discharged from the city and stock yards sewers in the
6852 neighborhood of the Bridgeport pumps amounted to ap-
proximately 240 tons daily, and I will have to explain or
should explain how that was reached.

Q. What date was that, professor?

A. That was through the winter of 1890-1891.

Q. Go ahead.

A. It is a very difficult matter to obtain an absolutely accurate determination of organic matter in mixtures as complex as this, using the term "accuracy" as understood by chemists. A great many of our analyses of organic matter are made with an accuracy of one-tenth or two-tenths of one per cent. Such a degree of accuracy is not possible in an examination of this kind. An accuracy of one or two per cent. or rather an error of one or two per cent. at the most, is as near as we could expect, so, probably the 240 tons daily which I have given, must not be assumed to be accurate within one per cent., perhaps, or two per cent of the whole. This determination was made in two ways mainly. The samples of water taken were mixed thoroughly, an average portion was subjected finally to analysis. Measured portions of the sample brought to me were evaporated to dryness in a platinum dish and the residue so obtained was incinerated, that is, burnt, not directly, but by the method known
as the Drown method, suggested and used first in the
6853 Massachusetts State Board of Health. A platinum dish
being placed inside of another much larger platinum dish,
supporting a platinum coil, a burner being placed below this dish and a radiating plate of metal, in my case, polished nickel, being placed some distance above the dish so that the organic matter under these conditions could be burned off at the lowest possible temperature without the destruction of any large amount of the inorganic substances. That test was made in all cases, using 500 cubic centimeters to a liter of the water in each test, 500 cubic centimeters with the stronger waters and more for those containing less sewage. In all these cases also, the determination of nitrogen was made by the methods employed by

chemists using the so-called Kjel Dahl process. A determination of this nitrogen served as a check in a measure, on the determination of the total solids, the nitrogen being essentially of a proteid character, it is possible by the calculation which I intend to explain here, and which is commonly known to chemists, to calculate the organic matter from the nitrogen. These two results agreed in giving the figures that I have stated here.

I also made similar determinations of the water by similar methods, as it passed the Bridgeport pumps, to determine what part of the organic matter was probably decomposed within the city. The figure that I have given here of 240 tons, is
6854 the amount discharged from the sewers. The next important question was what portion of this actually passed the pumps into the canal. These determinations were made a number of times and it was found that about five-sixths of the water in one series of investigations, the one which I have given, passed the pumps. The remainder being decomposed inside of the city, that is, the decomposition of the organic matter was in the city. In the warmer months a very much larger proportion of the organic matter is decomposed in the city than in the colder months. These determinations were made in the colder weather; the fall, winter and spring of 1890-1891.

Q. Were all these examinations that you have testified to made a matter of publicity?

A. The last ones I have testified to were not; the first ones made in 1886, were.

Q. And was the last one subsequently published?

A. The last ones were not published except in this book.

Q. What book is that; I want that in the record?

A. The details of this investigation were never published. The only publications made were in the resume which I have quoted from, given on pages 67 and 68 of the report of the Illinois State Board of Health, printed in 1901, by the authority of the State Board of Health of the State of Illinois.

6855 Q. Professor, from your examinations as you have testified, from 1886 down to the winter of 1888 and 1889 exclusive of the sewage examinations at Chicago made by you and testified to by you in the record, what did those examinations disclose as to the condition of the Illinois river for those separate periods?

MR. JEFFRIES: We object to the question for the simple reason that the examinations which the witness has just testified to referred to the sewage of Chicago and therefore had no connection with the Illinois river at that time.

(Question repeated.)

MR. JEFFRIES: I object to the question for the reason that the witness has already testified on that proposition and also for the reasons stated in our objections to the testimony given yesterday when similar questions were propounded, for the reason that there is no evidence to show the manner in which the samples of water were taken from the river, whether beneath or on the surface of the water; no evidence showing that any instructions were given as to the manner of taking the samples; no evidence showing that instructions if given, were carried out, in taking the samples, and no evidence showing the local condition of the weather and the water in the river, the stages of the river, and any comparison that may be 6856 drawn by this witness or any statement with reference to the condition of the river as drawn from these examinations would be misleading, and incorrect. Therefore it is incompetent and not legal proof.

A. The comparison of the results obtained in the Illinois river in 1886, with those obtained two years later, 1888, 1889, indicate increased pollution of the Illinois river at Peoria. From personal observation of the Illinois river at Peoria in 1886, I know that the water was potable, and formed a large part of the water supply of the city of Peoria. From personal observation I know that later this water supply was abandoned because of the increasing pollution of the river, which was shown also by the analyses.

Q. What was the condition of the river at Grafton during these periods based upon your analyses?

MR. JEFFRIES: We object to the question for the same reasons stated in the objection to the previous question.

A. I had no data for Grafton in 1886, so I cannot make a comparison. I am unable to make a comparison.

Q. What point farthest down the river have you data for?

A. Peoria for the year 1886.

Q. Were you acquainted or do you know when the so-called Hering Commission was appointed?

6857 A. I do.

Q. Are you acquainted with the facts that led to the appointment of this commission?

A. I am.

Q. Will you state them?

MR. JEFFRIES: Object to that as incompetent, irrelevant and immaterial and having no bearing on the issues involved in the case.

A. As the chemist to the Health Department of the city of Chicago and as the chemist of the State Board of Health, I was familiar with the discussion regarding the water supply of Chicago and the increasing pollution of the same. The necessity of doing something to prevent contamination of the drinking water by the discharge of sewage was recognized by everybody and many plans were suggested to correct this difficulty. Among the sanitarians within the city of Chicago several essentially different schemes of betterment were suggested, so that it was finally suggested to create a commission to decide on a scheme and bring in from outside of Chicago some expert of recognized ability who had not previously taken part in the local discussion.

Q. Were you present at all of these discussions?

A. I was not present at all of these discussions because 6858 they were general discussions. They took place in the engineer's office and in the Citizens' Association. I was frequently present there, being a member of the association. They were discussed by the daily press, and of course I couldn't be present at all of them. I was quite familiar with the general trend of the discussion. It was finally decided to appoint this commission and the appointment was made in 1886, with Mr. Rudolph Hering, an engineer, as the chairman of the commission, with Mr. Benezette Williams and the city engineer, Mr. Actingstall, as the other members of the commission. This commission after a year or more of work decided on a method by which the increasing sewage of the city of Chicago could be most effectually disposed of. This commission considered for a long time the question of the disposition of the sewage on land, in the vicinity of Chicago. I am somewhat familiar with the discussions, because I was asked several times to explain the character of the soil which would be necessary to receive and dispose of sewage continuously and in large amounts. The question of carrying the sewage through an immense tunnel a long distance into the lake and discharging it there, was also favored by some at the time and considered by this commission. After consideration of the various plans the commission decided on the construction of a so-called drainage canal, following essentially the recommendations which had been made by Dr. 6859 Rauch of the State Board of Health, and others years before.

Q. Are you acquainted with what the recommendations were as made by Dr. Rauch?

MR. JEFFRIES: We object to the witness testifying to any recommendations made by Dr. Rauch for the reason that it is merely hearsay evidence and is incompetent and immaterial.

A. The recommendation made by Dr. Rauch for years, and published in the reports and bulletins of the State Board of Health was that the drainage canal be constructed along the line, or near the old Illinois and Michigan Canal, to connect the water of Lake Michigan by gravity flow with the Desplaines, and subsequently the Illinois river, a sufficient volume of lake water being allowed to flow through this canal to so dilute the sewage taken up in the flow from the city of Chicago that the final result would be a product not objectionable to the senses of the people living along the canal and the valley towns. I should add in explanation of this that objections were expressed by people in the valley towns that the river so enlarged and carrying down perhaps more sewage, would emit a worse smell in the big canal than in the old. Their objections were based very largely on that supposition. The recommendation of Dr. Rauch was to dilute with sufficient pure water to overcome that objection. His recommendation provided for a maxi- 6860 mum flow of 600,000 cubic feet per minute, based on an estimated population of 2,000,000.

Q. Were Dr. Rauch's recommendations or views ever committed to any publication?

A. The recommendations of Dr. Rauch were frequently published in various bulletins from the State Board of Health and the proceedings of sanitary conventions and elsewhere.

Q. At what date were these recommendation made by Dr. Rauch, professor?

A. The recommendations of Dr. Rauch were made in 1879. That is one date I find here (referring to book).

Q. In what publication does that appear

A. Publications of the State Board of Health and referred to in the publication which I have here. The original I have not at hand now.

Q. Well, name it, so it will get into the record?

A. It is the preliminary report of the Illinois State Board of Health of the Water Supplies of Illinois and the pollution of its Streams, printed in 1889 by the Illinois State Board of Health by Dr. Rauch. It is a report published by Dr. Rauch, and reviews his previous recommendations regarding the disposition of the sewage, and gives the dates where some of these recommendations, or rather when some of these recommendations were made. I do not put my hand on them at this moment. 6861

Q. When was that preliminary report published, professor?

A. This preliminary report was published in Springfield, Illinois, in 1889.

Q. For what purpose, if you know?

A. For the purpose of giving the results of examinations of the water in the lake and Illinois river made by myself for the Illinois State Board of Health.

Q. At the time that report was published, was the legislature in session?

A. I am not positive except from hearsay. It was in session but I was not present, but I know it was in session.

Q. Do you know of your own knowledge whether the question of legislation involving the sanitary condition of Chicago was in the legislature for discussion at the time that report was published?

A. I do know that of my own knowledge. I have since found a reference to the recommendations of Dr. Rauch, in a note entitled "Explanatory and Supplemental," in this preliminary report of the Illinois State Board of Health referred to and printed in 1889, in which the explanation of the dilution of the sewage is given. That is, the explanation recommended by Dr. Rauch.

6862 Q. Do you know why this report was gotten out and entitled a preliminary report?

MR. JEFFRIES: I object to the question for the reason that such evidence is merely hearsay and based upon the opinion of the witness and is not competent proof and is immaterial.

A. This report was gotten out in answer to questions brought up in Springfield regarding the character of the water of the Illinois river and the changes in the water by flow from the sewage from Chicago through the canal, the Desplaines river and the Illinois to Peoria, and the towns below. It was called a preliminary report because in order to answer the questions then under discussion—

Q. Where did these questions emanate?

A. These questions emanated in the legislature at Springfield. This report is called a preliminary report, because in order to answer these questions it was necessary to bring it out in a very great hurry, the expectation being to issue the full report some time later. As an actual fact the full report was made by myself later, but it was not published.

MR. JEFFRIES: I object to the answer and move to strike out all the witness said with reference to the subject of discussion and where it emanated, for the reason that he states it emanated in the legislature and if so the records of the session of the legislature in which it was discussed and consid-
6863 ered are the best evidence and is the only evidence that can be considered.

Q. MR. TODD: Do you know whether the law creating the sanitary district was passed in the legislature in 1889?

MR. JEFFRIES: I object to the question for the reason that the law will show for itself when it was passed.

A. I cannot recall the date.

Q. MR. TODD: Professor, did you make any series of analyses in the year 1899?

A. I did.

Q. Will you state what you did preliminary to the arranging for collections of samples for that investigation.

A. In the summer of 1889 I was authorized by the State Board of Health to begin a chemical examination of the waters of the Illinois river and its tributaries and the canal leading from Chicago into the Illinois river. Before beginning those analyses, I made a trip of inspection from Bridgeport through the canal and down the Illinois river to the mouth of the river at Grafton. This trip was made in company with Mr. Jacob A. Harman, an engineer employed by the State Board of Health, and was for the purpose of familiarizing us with the locations and general conditions along the river and for the further purpose of selecting water takers to obtain samples of water
6864 for the various points and ship them to me at Chicago for examination.

MR. WOERNER: What date was that, Professor?

A. That was in 1889, in the early summer.

Q. MR. TODD: What points were selected for the collection of samples for this investigation?

A. The points selected were as follows: Bridgeport at the source of the Illinois and Michigan Canal within the city of Chicago, this point being located near the corner of Ashland Avenue and 31st Street. That was the first point. Samples were taken from under the bridge at the beginning of the canal just west from the pumping station and about 50 feet away from the station and were taken by an assistant sent from my laboratory.

Q. Do you know his name?

A. Yes, Mr. Frank Wright.

Q. Where was the second place?

A. The next collections were made in the Illinois and Michigan Canal at Lockport about 29 miles below Bridgeport. The samples were taken from a point in the canal 200 feet east of the main bridge, and above the entrance to a small stream. They were taken by Mr. P. O'Brien.

Q. Was that the gentleman who testified here yesterday?

6865 A. The man who testified yesterday, yes sir.

Q. And who identified the State's Exhibit 11 for identification, as a correct copy of the cards which he placed upon the samples sent to you?

A. It was the same man. Samples were also taken from the Desplaines river at Lockport, the location being above the stone bridge north of the town. These samples were taken by the same collector, Mr. P. O'Brien.

Q. Where was the next place?

A. The next collection of samples was made at Joliet 33 miles below Bridgeport, of the water of the canal and the Desplaines mixed, these two waters flowing together in the upper part of what is called the basin above Joliet. The collections were made by Mr. B. F. Long, at a point in this upper basin away from some construction work which was going on at the time, and far enough removed from this work to be unaffected by any sediment stirred up or brought into the water.

ADJOURNED until 2:00 p. m. same day, Thursday, September 24, 1903.

6866 2:00 p. m., Thursday, September 24, 1903.

Continuation pursuant to adjournment. Present the Commissioner, and same counsel representing the respective parties.

PROF. JOHN H. LONG

resumed the stand for further direct examination by Mr. Todd and testified as follows:

Q. Proceed, professor.

A. The next collections from the Illinois river were made at Morris, 58 miles below Bridgeport, from a point in the middle of the stream above what is known as the wagon bridge, south of the city. Those collections were made by Dr. H. M. Ferguson, of Morris.

The next collections in the Illinois river were made at the city of Ottawa, 81 miles below Bridgeport, by Dr. W. A. Pike, the water being taken from a point in the Illinois river above the entrance of the Fox, about 200 yards.

The next collections in the Illinois river below Ottawa were made at the city of LaSalle, 95 miles from Bridgeport, by Mr. C. H. Nicolet, at a point 600 feet above the mouth of the Big Vermillion river.

6867 The next Illinois river collections were made at Henry, by H. J. Gregory, 600 feet above the dam and above the town. Henry is about 123 miles below Bridgeport.

The next Illinois river collection was made immediately above the city of Peoria, at the part of the river described as the Narrows and sometimes described as Averyville, the water being taken from near the center of the river, a point near the Peoria waterworks, by Mr. C. F. Hixon. This station is about 157 miles from Bridgeport.

Another set of collections was made from Peoria, the point being described as Lower Peoria, or sometimes as Wesley, from the name of a small town on the opposite side of the river. The collection was made below the city of Peoria, and below the out-falls of the sewers of the city, and the drains leading from the distilleries and the cattle sheds at Peoria. This point is about 163 miles from Bridgeport. The collections were made there by Mr. Henry Ocker.

The next Illinois river collections were made in the town of Pekin, some nine miles below the point of the last collection and below the outlet from the cattle sheds of the distilleries at Pekin. The samples in this series of collections were taken by Mr. D. H. Jensen, then the surveyor of that place. These samples were taken about two miles below what is known as the Pekin bridge.

6868 The next Illinois river collections were made near the city of Havana, about 199 miles below Bridgeport, about 200 yards above what is known as the Wagon bridge at Havana, near the center of the stream. This was the first point of collection at which only two samples were taken. After that they were taken further up the river, above the mouth of the Spoon, the Spoon enters the Illinois from the west side, and but a short distance above the city of Havana. Mr. S. F. Kyle made the collections at this place.

The next Illinois river collections were made near the town of Pearl, at what is known as the Alton bridge—the point where the Alton railroad crosses the Illinois river. They were made close to the Alton bridge, about 200 feet below the Alton bridge, in the middle of the river. The name of the collector being E. H. Chandler.

The last Illinois river collections were made at Grafton, at the mouth of the river, where the river flows into the Mississippi, the point for the collections being taken about a mile and a half above the town, and above the point where the influence of the back water from the Mississippi river is felt. The name of the collector at this point was Mr. F. M. Calhoun.

In addition to these collections from the main river, a
6869 number of samples were taken from the tributaries of the
river.

The first of these tributaries considered, is the Kankakee river, which joins with the Desplaines below Joliet to form the Illinois. The samples were taken by Mr. C. D. Cassingham, near the middle of the river and below the town of Wilmington.

The next tributary samples were taken from the Fox river. The samples were taken at first from the river above the Rock Island bridge, about 100 yards, but later on account of the low water in the river proper, from what is known as the Fox river feeder. At this point water is drawn from the Fox river to feed the Illinois and Michigan Canal, and in dry weather a relatively large amount is diverted so that the fairest samples to represent the Fox river water were found in the feeder waters rather than in the bed of the river itself. The samples from the Fox river were taken by the same collector, Dr. W. A. Pike, who made the collections from the Illinois.

Samples were also taken from the Big Vermillion river, which flows into the Illinois from the south, at a point about two miles above LaSalle. The collections were made by Mr. Nicolet, the same who took the samples from the Illinois river
proper.
6870 The next tributary sample was taken from the Spoon
river by Mr. Kyle, who collected the Illinois river samples
at this point, and from a place in the river several hundred feet above its junction with the Illinois.

Samples of Sangamon river water were taken by Mr. G. P. Hollingsworth from near the mouth of the Sangamon river, from a point about 200 yards above the mouth of the river. These samples were marked as coming from Browning, because the collector lived at that place, and the point of collection was reached by him by rowing across from Browning and up into the Sangamon.

The last collections were made from the Mississippi river at Grafton, the samples being taken by Mr. Calhoun, the same man who collected the samples of the Illinois river at this point and from a point in the Mississippi river above the place where the Illinois enters, and far enough above to be beyond the effect of the mixing of the waters.

Q. Were those all the places and water-takers selected and appointed by you for the series of examinations in 1899?

A. These places given were the only ones from which collections were made along the Illinois river in that series of investigations, but samples of water were taken from the head waters of several of these tributaries some time later.

6871 Q. Were those samples that were taken some time later connected with this investigation?

A. They were.

Q. At what points was the water collected later?

A. In these examinations of the head-water samples, collections were made from the Kankakee river near South Bend, Indiana, the water being taken by Dr. George W. Van Benschotten; also from the water of the upper Desplaines, a sample being taken from a point near the town of Libertyville, by Mr. Clare Sherman; also from the upper DuPage, from a point near Wheaton, Illinois, by Dr. C. F. Blanchard; also from the upper Fox river, samples were taken by Dr. Charles H. Fegers, at McHenry, Illinois. Also from the upper waters of the Big Vermillion river; samples were taken by Dr. J. J. Stites, at Pontiac, Illinois. Also from the Mackinaw river, samples were taken by Dr. R. E. McKenzie at the town of Kappa, Illinois. Also from the upper Sangamon river; samples were taken by Dr. John H. Gardiner at Mahomet, Illinois. Also from the Upper Spoon river, samples were collected at Dahinda by Dr. J. B. Bedford.

Q. Are those all the places where samples of water were taken for this investigation in 1899, that you have detailed?

A. They are.

6872 Q. Did you make an investigation in 1900?

A. I did.

Q. At what points were samples taken and who were the water-takers that took them for you during the year 1900?

A. During the year 1900, samples were collected at the same points as during 1899, with two exceptions to be mentioned, the collections being made by the same collectors. The exceptions referred to are these: Samples were taken in 1900 from the now opened drainage canal at the Western Avenue bridge. These collections being made by an assistant from my laboratory, Mr. Wright. Collections were also made from the basin of the drainage canal at Lockport, by Mr. O'Brien.

Q. Did you make an investigation in 1901?

A. I did.

Q. At what points were samples collected in 1901?

A. In 1901 samples were collected at the mouth of the Illinois river at Grafton, the Mississippi river at Grafton—

Q. Give the names of the collectors?

A. The collector for both of those samples being Mr. F. M. Calhoun, the collector in the previous investigation.

Samples were also taken from the mouth of the Missouri river at a point about 200 yards above its junction with the Mississippi, the collector there being Mr. Gus. Bailey.

6873 Q. Were those the only places where samples were collected in 1901, those three places?

A. They are.

MR. JEFFRIES: I move to strike out the last statements of when and where examinations of water were made, for the reason that the witness did not testify from his own memory, but testified from a publication of some kind which is not produced before the Commissioner for examination by counsel.

MR. TODD: I want to concede the motion made by Mr. Jeffries to strike out the last answer made by the witness.

THE COMMISSIONER: That motion you assent to?

MR. TODD: I assent to that motion.

Q. Did you make an analysis or investigation of the waters of the Illinois, Mississippi and the Missouri river in 1901?

A. I did.

Q. At what points were samples taken for this investigation?

A. Samples were taken at a point above Grafton on the Illinois river, and on the Mississippi river, by Mr. F. M. Calhoun, who made the collections for the previous examination, the points in these two rivers being far enough above their junction to avoid any danger of a mixing of the waters.

Samples of Missouri river water were taken by Mr. Gus.
Bailey from a point in the Missouri river about 200 yards
6874 above the mouth of the river where it enters the Mississippi.

Q. Were those the only three places where water was collected from which you made your analyses for 1901?

A. They were.

MR. WOERNER: We now object to the witness reading from the printed documents which he has before him unless the counsel have an opportunity to know what document he is testifying from.

MR. TODD: I submit that the witness is not reading from any documents before him, but has a copy of the Illinois State Board of Health report for the year 1901, lying in front of him, and counsel on the other side have that document in their possession.

Q. Now, professor, have you given the stations along the rivers, the rivers and the other stations, together with the names of the collectors who collected the waters for the investigations made by you in 1899, 1900 and 1901?

A. I have.

Q. By whom were these collectors selected?

A. These collectors were selected by myself personally, at the time of a trip down the river. That is, the collectors along the Illinois river and the tributaries which I mentioned first.

Of the collectors of the head-water samples, two were
6875 selected by myself. The collectors of the upper Kankakee river water and of the upper Desplaines river water,
were selected by myself, while the collectors of the upper DuPage water, the upper Fox water, the upper Vermillion water, the upper Mackinaw water, the upper Sangamon water and the upper Spoon water, were selected by Dr. James A. Egan, the secretary of the State Board of Health of Illinois, the directions as to the method of collection being furnished by myself to Dr. Egan.

Q. Will you state what directions, if any, you gave to the collectors of this water to guide them in the collection of the water?

A. Before beginning the actual collection of these waters

I made a trip from Chicago to the mouth of the Illinois river, which I believe I referred to in the testimony of this morning. On that trip these collectors were selected by myself and instructed as to the method of collecting the samples, as to the place where the samples should be taken and as to the method of forwarding the sample to my address at Chicago. In order to make the method of collection plain to these men I had with me on that trip, bottles similar to those used in the actual collection, and in every instance I went with the collector to the stream in question and showed him by my own motions, how the sample of water was to be taken.

6876 Q. What was the size of the bottles employed by you in this work?

A. In this series of investigations, two samples of water were taken at each point, first a large sample of about a gallon was taken, in a so-called gallon bottle, this sample being used for the chemical analyses. A second, smaller sample of about six ounces was collected in a small bottle, this water to be used for the so-called bacterial examination.

Q. Have you a set of these bottles in your possession at present?

A. I have.

Q. Will you bring them to court when you come again?

A. I will.

Q. Will you state what your instructions were to the collectors of these samples of water, in full?

A. The instructions were these: It was first explained to the collectors that the bottles for the collections would be sent to them in perfectly clean condition, ready for the receipt of the water. Each bottle was closed by a ground-glass stopper, the stopper being tied down by means of a heavy piece of muslin and a strong cord, in the case of the larger sample for the chemical analyses, and by a small sheet of rubber cloth held in place by a rubber band in the case of the small bottle for
6877 the bacterial analyses The collector was instructed to take his two samples, the one for the chemical analysis and the one for the bacterial analysis, at the same time and place.

Directions were given to remove the cloth from the stopper of the large bottle and to remove the stopper, holding that in his left hand, or inverting it on the seat of the boat from which the collections were made, and by use of the right arm the bottle was to be immersed as far as possible below the surface of the water and filled nearly, but not quite full, the water to be filled within half an inch or an inch of the top so as to give sufficient space for expansion. This was to avoid the breaking of the bottles in case it should become warm after collection. It was explained also to the collector that the small bottle which received the sample of water for bacterial analysis, was thoroughly sterilized before being sent from my laboratory, and therefore must be handled with proper precautions. The collector was instructed as to how the sample was to be taken from the river in this case, in such a manner as to avoid as far as possible any contamination from his hands. The collector was instructed to loosen the rubber band which held the rubber cloth over the stopper and neck of the bottle and to remove the stopper from the bottle but not to remove the rubber cloth from the stopper; not to touch the stopper with his bare hands in
6878 any manner. This removal of the stopper of the bottle was to be made after the bottle was submerged beneath the surface of the water. Under those conditions it was possible to fill the bottle with water with little or no contamination from the outside. When the bottle was full, the stopper was to be re-inserted, the rubber band shoved down over the neck so as to hold the rubber cloth in place. This small bottle was then to be put inside of a small tin can which had a little cotton in it to prevent the bottle from shaking about and breaking. This small can in turn was to be placed inside of a large tin can, the small can I should state, was closed by a tin lid by insertion, a can such as commonly used for containing paints and varnishes and so on, of common type where the lid is inserted and remains in place because of its tight fit. This small can was to be placed as explained, inside of a large tin can similarly constructed, this large can holding about a gallon and a half. The collector was instructed to pack this large can as thoroughly as possible with broken ice and enough excelsior to hold the small can practically in a fixed position. He was in-

structed to have this ice with him on starting out onto the river to make the collection and to place the ice around the small can inside of the large one immediately after making the
6879 collection and not to bring it to the shore and then put in the ice. After so packing this large tin can it was to be placed in the proper compartment of the shipping box, packed and surrounded there by as much excelsior as could be crammed into the box around the can, this excelsior being used not only to hold the can in place, but to maintain the temperature and by its non-conducting power to prevent the action of the higher outside temperature as far as possible, the object of this being to prevent the water enclosed in the small bottle inside of the two cans, from reaching a high temperatcre.

The large bottle containing the sample for chemical analysis was placed in another compartment of the same shipping box, packed in with excelsior and the whole then was sent to me by express, one shipping envelope being attached usually to the neck of the large bottle by means of a stout cord. This shipping envelope contained also some memoranda which the collector was instructed to make in each case, regarding the time and place and conditions of collection. Such a memorandum I have here, as also a shipping envelope similar to those used throughout the collections.

MR. TODD: I offer the envelope and the blank slip in evidence as defendants' Exhibits Nos. 3 and 4.

Said documents received and so marked by the Commissioner.

Not reproduced.

6880 Q. What you have stated in regard to directions of packing and shipping of samples, applies to all the samples taken for the several investigations conducted by you, does it?

A. It does.

Q. How were those samples thus collected received at the laboratory?

A. Those samples were received by express at the laboratory, and I should state this point in addition. From places where two express services could reach Chicago, I picked out the express company which was able to deliver the sample most directly without transferring it. In some of these towns the United States, the Adams and the American express companies can reach Chicago, but usually only one of them directly. I picked out in every case that company which could bring the sample without re-shipping.

Q. After the samples were received or arrived in Chicago who received them at the laboratory?

A. These samples were delivered by the companies and received either by myself personally, or by one of two assistants, Mr. Frank Wright, or Mr. William Johnson, it being understood that some one of us was to be present all the time at the laboratory. The samples were received and taken care of without delay.

6881 Q. After they arrived at the laboratory what was done with them?

A. When these samples were brought to the laboratory, the analyses were undertaken at the earliest possible moment, and always the same day.

Q. How was each sample marked for identification?

A. Each sample reached the laboratory in a shipping box containing a large bottle and a small bottle. These boxes were opened and a label was pasted immediately on the bottle and on the can. The label indicated the place from which the sample was received and also the serial number of the sample. The number and name being carried out through the record.

Q. Did all the samples from each particular point have a serial number?

A. They did. As the samples came in, a number was given to each box. That number was marked to begin with, on the shipping envelope and the same number was put on a small label and pasted on the large bottle taken out from its compartment; also the same number was put on a small label and pasted on the tin can containing the small bottle for bacteriological analyses. These numbers were given, you might say, chronologically, according to the time and order in which they were received, and those numbers were followed throughout.

6882 Q. So that the serial numbers applied to the samples at the time that they were received in the laboratory and not at the time they were taken?

A. They applied at the time they were received at the laboratory and not at the time they were taken and only for our own identification.

Q. When the samples came to the laboratory, what was done with the cards accompanying the samples?

A. The cards were removed from the envelopes after these memoranda and labels were put on the bottle, as explained. The cards containing the name of the collector and the time of collection and place of collection, were received, and are now nearly all in existence. I will not guarantee that all are in existence, because no attempt was made to save all of them, although practically nearly all were saved.

Q. I show you the cards of H. M. Ferguson of Morris, marked "State of Illinois No. 17 for identification" and the cards of witness W. A. Pike, from the Fox river marked "State of Illinois Exhibit 16 for identification;" the cards of the witness W. A. Pike, of the Illinois river at Ottawa, marked "State of Illinois Exhibit No. 15 for identification;" the cards of Charles H. Nicolet, from the Vermillion river and the Illinois river at LaSalle, marked "State of Illinois Exhibits Nos. 13 and 14 for identification;" the cards of C. F. Hixon, 6883 Averyville or Peoria Narrows, marked "State of Illinois Exhibit No. 12 A, for identification;" the cards of witness Henry Ocker, at Wesley, marked the "State of Illinois Exhibit 12 for identification;" the cards of witness Will Sievers at Henry, Illinois, marked "State of Illinois Exhibit No. 10," the cards of witness D. H. Jensen of Pekin, marked "State of Illinois Exhibit No 9 for identification;" the cards of S. F. Kyle of Spoon river at Havana, marked "State of Illinois Exhibit No. 8 for identification;" the cards of witness S. F. Kyle, Illinois river samples at Havana, marked "State of Illinois Exhibit No. 7 for identification;" the cards of witness G. P. Hollingsworth, Browning, Illinois, marked "State of Illinois Exhibit No. 6 for identification;" the cards of witness J. Rader, of Pearl, Illinois, marked "State of Illinois Exhibit No. 6 for identification;" the cards of F. H. Chandler at Pearl Illinois, marked "State of Illinois Exhibit No. 5 for identification;" the cards of witness F. M. Calhoun at Grafton, in three separate exhibits for the Mississippi river and the Illinois river, and marked "State of Illinois

exhibits Nos. 1, 2 and 3 for identification;" the cards of witness G. Bailey, at the mouth of the Missouri river, and marked the "State of Illinois Exhibit No. 4 for identification;" and I will ask you to examine the cards and state whether all those cards with the sample attached were received in your
6884 laboratory in the city of Chicago from the different parties whose names I have mentioned?

A. Yes sir, these are the cards of the collectors which were received by me in the course of this examination.

MR. TODD: I offer in evidence defendants' Exhibit 3 and State of Illinois Exhibit No. 11, for identification as a sample of the envelope and cards contained in the State of Illinois Exhibits from 1 to 17 inclusive, for identification and submit said exhibits for identification to the inspection of the complainant in the case and will offer them in evidence if required, and I will withdraw defendants' Exhibit No. 14, and substitute for it Exhibit No. 11 for identification and ask to have that marked defendants' Exhibit No. 4.

So marked by the Commissioner.

Q. Have you the cards for the samples taken by Benjamin F. Long at Joliet?

A. I have.

Q. Are these cards which I hand you the cards attached to the samples of water received by you from Benjamin F. Long in Joliet?

A. They are.

MR. TODD: I offer these cards in evidence as the State of Illinois Exhibit 18 for identification.

Q. Have you the cards of P. W. O'Brien who testified yesterday that he sent the samples of water to you, upon cards which were similar to defendants' Exhibit 4, and which
6885 is now known as defendant's Exhibit 4?

A. I have those cards.

MR. TODD: I offer those cards in evidence for identification, to be treated in the same manner as the State of Illinois Exhibits already identified, from 1 to 17, to be governed by defendants' Exhibit 4.

Q. What is true of the Desplaines river and the cards directed by P. W. O'Brien, is true of the canal at Lockport, is it?

A. It is.

Q. Are those the cards of the samples collected and sent you by P. W..O'Brien as testified to by him yesterday, in your presence?

A. They are.

MR. TODD: I offer those cards as the State of Illinois Exhibit, to be placed with the State of Illinois Exhibits 1 to 17 inclusive, and as identified by defendants' Exhibit 4.

Q. Have you the cards collected by P. W. O'Brien at Lockport in the drainage canal?

A. I have.

Q. Are those the cards?

A. Those are the cards.

MR. TODD: I offer those cards to be treated and considered in the same manner as the State of Illinois Exhibits 6886 1 to 17, for identification, in connection with defendants' Exhibit 4.

Q. Have you the cards of the samples collected by Mr. C. B. Cassingham, from the Kankakee river, from the middle of the river just below the town of Wilmington?

A. I have.

Q. Are these the cards which I show you?

A. They are.

Q. Which were attached to the samples sent to you by C. D. Cassingham from the point indicated in the last question?

A. They are.

MR. TODD: I offer those cards as the State of Illinois Exhibit No. 19 for identification.

MR. JEFFRIES: To the introduction of which the complainant objects for the reason that there is no evidence to show that the samples were taken under instructions or that if instructions were given they were carried out, and there is no evidence as to the manner in which the samples from the Kankakee river were collected.

Q. MR. TODD: Have you the tags for the upper Kankakee water taken by Dr. George W. Van Benschotten, near South Bend, Indiana, the upper Desplaines water near Libertyville taken by Mr. Clare Sherman and the Upper DuPage samples taken near Wheaton by C. F. Blanchard; the upper Fox river samples taken

by Charles H. Fegers at McHenry; the upper Big Vermil-
6887 lion collected by J. J. Stites at Pontiac. The Mackinaw river water taken by R. E. McKenzie; the upper Sangamon collected by John H. Gardiner at Mahomet; the upper Spoon river collected at Dahinda by Dr. J. D. Bedford?

A. I have.

Q. Are these the cards?

A. Those are the cards.

MR. TODD: I offer these cards and ask to have them marked State of Illinois Exhibit No. 20 for identification.

MR. JEFFRIES: To which offer the same objection is made as to the previous offer with reference to the samples taken by Mr. Cassingham at Wilmington.

Q. MR. TODD: Professor, at what points did your assistants, Frank Wright and William Johnson, collect water for you?

A. From the city of Bridgeport in the drainage canal.

Q. And the samples collected by them, how were they conveyed to the laboratory?

A. They were conveyed to the laboratory in bottles similar to those used in the other collection.

Q. By express or in person?

A. In person.

Q. These two men are still living?

A. They are.

Q. And can be brought here to testify?

A. They can.

6888 Q. These cards that have been introduced here and testified to by you are all the cards received by you attached to samples of water for the three investigations which you made in 1899, 1900 and 1901?

A. They are all the cards which I have remaining. I stated a little while ago that some few of these cards are lost or mislaid, but all of them which I had at the conclusion of the investigation were included in these.

Q. And they apply to the three investigations?

A. They apply to the three investigations.

Q. In the first investigation of 1899, how often were the samples of water collected?

A. The samples of water were collected for most of these places weekly, the dates of collection being given in the report which I have referred to. The Illinois State Board of Health report of the investigation of the Illinois river and its tributaries, published in 1901 by the State Board of Health. The times and places of these analyses are all given in that report.

Q. You have already testified to the places?

A. Yes sir, and the times are given also along with the places and the tables, in this report.

Q. In the first investigation of 1899, how often were the samples of water collected?

6889 A. The samples were collected from points along the Illinois river and the tributaries weekly.

Q. That is, one sample a week?

A. That is one sample each week.

Q. How often were the samples collected in 1900?

A. The samples were collected in 1900 from the same place, also weekly.

Q. In 1901 how often?

A. In 1901 the samples were collected weekly or in some cases more frequently; I couldn't give those dates now, but at least weekly.

Q. In these samples which were received at your laboratory and collected in the manner that has been testified to here in the evidence, does each card represent one chemical and one bacteriological sample?

A. It does, the samples being collected at the same time and place by the same collector.

Q. And received at the same place?

A. And received at the same time and place.

Q. What was done with the bacteriological sample after it arrived at the laboratory?

A. After the arrival of the bacteriological sample at the
laboratory certain tests of a chemical nature, sometimes
6890 spoken of as bacteriological, were made by myself. The
portions of water from the small bottle being used for
this purpose, and being taken in such a manner as not to interfere with the use of the remainder for the bacteriological test

proper. The remainder of this sample was then turned over to Dr. Robert F. Zeit for examination.

Q. Did anyone in your laboratory except yourself handle the bacteriological sample first?

A. The bacteriological samples were all handled under my immediate direction and supervision, or by myself or Mr. Wright or Mr. Johnson, referred to. All experiments made with them were made under my supervision, handled simply for me and with me.

Q. And the remainder of the sample was turned over to Prof. Zeit as you stated?

A. Turned over to Professor Zeit by myself as I have stated. Prof. Zeit's laboratory being in the same building and on the same floor.

Q. How long after the chemical samples reached your laboratory before you proceeded with the analysis?

A. The analysis of these samples was taken up immediately as explained, the same day of their receipt, and completed as soon as possible afterwards. The determination of constituents liable to change being made first, for the element of quick rapid work was important in such cases.

6891 Q. Professor, you have stated in your testimony heretofore given, the method pursued by you in the analyses from 1886 down to 1890 and 1891 inclusive, and if in the analyses conducted by you during these last series you made any change in your method, I wish you would briefly state what that change was.

A. The variations in the methods employed in the later analyses from those employed in the earlier ones described in my previous testimony are these: The solids were determined essentially as described, the solids in solution and in suspension. The chlorine was determined as described by the Volhard process in the stronger waters; that is those containing the most chlorines by direct titration, but in most of them, after evaporating a measured portion of the water to a small volume. The titration was made in the usual way, as described, in this concentrated solution. The determination of the oxygen consumption was made by the method I described before. The free ammonia was determined as described before and also the albuminoid ammonia. In these later investigations a test was made for the substances known as nitrites,—combinations of nitrous acids with bases, the test usually being a modification of the so-called Gries method, employing the reaction which takes place when sulphanilic acid and naphthylamine are brought together in the presence of nitrous acid. In the presence of 6892 nitrous acid in the acid solution, these substances condense, to form a characteristic so-called, azo color. The formation of that color in the presence of these reagents mentioned is a proof of the presence of the nitrous acid. This is a standard method well known and commonly used by chemists and need not be more fully described. The nitrates are determined not as in the previous investigations, but in this case by the so-called phenol-sulphonic acid method. The test depending on the production of picric acid by the action of the nitrate in the water on the test reagent used. This picric acid when combined with ammonia in the last part of the test, strikes a characteristic color easily recognized and measured. The extent of this coloration is a measure of the amount of nitrate present. In some cases the total nitrogen in the water in the so-called organic or unoxidized condition, was determined by a method known as the Kjel-Dahl process. This comprises then, the variations from the method before detailed.

Q. In these analyses for the periods of 1899, 1900 and 1901 did you make examinations for the same determinations as were made in the previous analyses, from 1886 to 1890 as heretofore testified to by you?

A. Essentially the same with the addition of the test for 6893 nitrites which has just been described.

Q. In the series of 1899, will you give the number of samples analyzed by you at each place?

A. In that series of investigations I examined 21 samples of the canal water from Bridgeport.

Q. Read them off in order.

A. Bridgeport, canal water, 21 samples,
Lockport, canal water, 22 samples,
Lockport, Desplaines River water 27. samples,
Joliet, mixed canal and Desplaines water, 17 samples;
Wilmington, canal water, 9,

Morris, Illinois river water, 22,
Ottawa, Illinois river water, 22,
Ottawa, Fox river water, 6,
LaSalle, Illinois river water, 21,
LaSalle, Big Vermillion river water, 8,
Henry, Illinois river water, 19,
Peoria Narrows or Upper Peoria, Illinois river, 15,
Peoria, Wesley, or Lower Peoria, Illinois river, 21,
Pekin, Illinois River, 19,
Havana, Illinois River, 18,
Havana, Spoon river, 4,
Browning, Sangamon river, 7,
Pearl, Illinois, 18,
6894 Grafton, Illinois river, 21,
Grafton, Mississippi river, 13,
South Bend, Kankakee river, 3,
Libertyville, Desplaines river, 4,
Wheaton or Winfield, DuPage river, 3,
McHenry, Fox river, 3,
Pontiac, Big Vermillion, 3,
Dahinda, Spoon river, 3,
Kappa, Mackinaw river, 2,
Mahomet, Sangamon river, 3,

MR. JEFFRIES: Now we move to strike out all of the statement of the witness in reference to samples that were analyzed from water in all the rivers tributary to the Illinois river, for the reason that there is no evidence to show the manner in which the samples were taken and no evidence to show that samples were taken under instructions, and if the instructions were given, no evidence that such instructions were carried out, and for the reason that such examination of the waters of the said tributaries is incompetent, irrelevant and immaterial and we object to the witness stating or testifying to the examination or any other examination of such waters during any of the other periods or times when analyses or examinations were made of said water, for the same reasons.

ADJOURNED until 10:00 A. M. Friday, Sept. 25, 1903.

10:00 A. M., Friday, September 25, 1903.

6895 Continuation pursuant to adjournment.

Present, the Commissioner and same counsel representing the respective parties.

PROF. JOHN H. LONG,

resumed the stand for further direct-examination by Mr. Todd and testified as follows:

Q. Professor have you brought samples of the large and small bottles with which the collections were made under your directions, and from the contents of which bottles your analyses were based?

A. I have.

Q. Have you the large bottle present?

A. I have.

Q. And the small bottle?

A. I have.

Q. Which bottle was used for chemical analyses?

A. The large bottle.

Q. And which one for bacteriological analyses?

A. The small bottle.

6896 Q. Did you see the bottles that were used by the experts in St. Louis for the taking of water for chemical and bacteriological purposes?

A. I did.

Q. How do these bottles which you have presented here, compare with the bottles used by the St. Louis experts for the collection of water?

A. I believe they are essentially smiliar to those bottles. As a matter of fact the bottles were obtained from a dealer in St. Louis,—from Henry Hyle & Company.

MR. WOERNER: Both sized bottles I suppose?

A. Yes.

MR. TODD: I offer the two bottles presented here by the witness for the inspection of attorneys for complainant, and in view of the fact that the bottles here are substantially in all particulars the same as those offered by complainant, I will let complainant's Exhibit of bottles stand as exhibit for the defendants in the case, unless objected to.

Q. In the collection of all the samples made, was the same precaution observed in regard to each sample?

A. The same precaution was observed in all cases except that of the city collection from Bridgeport and the drainage canal, these points being close to the laboratory by street car, but one sample was taken in a large bottle and a portion of that sample was removed from the bottle when the laboratory was reached and used for the bacterial tests, after cooling. 6897

Q. When the samples arrived at your laboratory in the manner that you have indicated heretofore, in your testimony, who conducted the chemical analyses of the water?

A. The chemical analysis of these waters was conducted by myself or under my immediate direction, by two men, Mr. Frank Wright and Mr. William Johnson.

Q. You have already stated in your testimony the methods pursued by you in making these analyses, have you not, professor?

A. I have.

Q. Have you the results of your analyses with you?

A. I have.

Q. In what form have you those results?

A. I have these results in printed form as they appeared in my reports to the Illinois State Board of Health, published by the authority of the secretary of the State Board of Health.

MR. WOERNER: What period of time does this cover, Professor Long?

A. This covers 1899 and 1900.

Q. MR. TODD: In the report published by the Illinois State Board of Health, did you have anything to do with the printing of that report, the reading of the proof and the comparison of the tables there published, with your original memoranda?

6898 A. I had. The proofs were sent to me for comparison with the original manuscript, and notes. This comparison was made and to the best of my belief the figures given in this report are correct.

Q. Professor, in your examination yesterday, you made some reference to a bacterial examination in which you said that that examination was not strictly a bacterial examination according to modern methods. Will you explain that examination as made by you?

A. In addition to the ordinary generally recognized chemical tests which I have described, I made a certain number of tests which have been described as bacterial, but which are really of a nature of chemical tests or reactions intended to show the presence of organic matter in the living or organized forms. These tests included an estimation of the amount approximately of this organized organic matter described usually as a count of the colonies. That embraced also a test of the water with reference to the organic forms in it which are able to produce a certain kind of fermentation in the liberation of gases. It embraced also a determination of the behavior of water with reference to its power of liberating or forming acids from certain sugars, recognized by the coagulation of milk, and finally,
it embraced a test for those living forms in water which
6899 are able to decompose or break down protein matters
with the production of a substance known as indol. These tests being in a measure quantitative as well as qualitative, that is they give an indication of the kind of organized organic matter present and also to some extent of the amount of this organic matter present. These tests were made by the methods usually employed by bacteriologists or chemists in the examination of waters. The estimation of the approximate amount of this organized matter as disclosed by what is called a colony count was made in the usual way by inoculating a gelatin solution with a certain amount of the water in question. This gelatin solution being made from the usually mixture of gelatin, an extract of meat, but rendered neutral instead of acid as is most commonly recommended. In this combination of water containing organized forms with gelatin and the nutrient substances which were all protein, conditions are offered for the

multiplication of these organized forms in such a manner that the number, or roughly, the amount may be recognized and counted. The counts were made in the usual manner for several days, by methods well known to all bacteriologists.

The qualitative test for the organized forms in water which are able to liberate acid from carbo-hydrates was made by using a sterilized milk, from which the cream had
6900 separated. This sterilized milk being mixed with a small volume of the water in question, generally one cubic centimeter, or less in case of some of the most contaminated waters, and allowed to stand some time at the temperature of the human body, approximately 37 to 38 degrees centigrade. The extent of the contamination of water with organized forms which are able to decompose sugar with the liberation of acid, is indicated by the rapidity with which the milk coagulates, the coagulation of the milk depending on the liberation of the acid, and the subsequent precipitation of the casein of the milk.

Another test was made by the inoculation of water into a prepared mixture of bouillon broth and sugar containing about two per cent. of glucose. Various organized forms have the power of decomposing sugars and liberating certain gases. In this reaction where these organized forms are present the saccharine matter or sugar of the bouillon is decomposed and the gases, especially carbon dioxide and hydrogen gases, are liberated. An observation of the amount of this gas gives a rough measure, a clew to the kind and extent of the pollution. With these living organic forms, the test is at best but an approximation. A prepared peptone solution containing a small amount of some mineral salt, salts known as phosphates in partic-
6901 ular, is inoculated with water, usually one cubic centimeter, and kept warm or incubated through the period of several days. Certain living forms have the power of breaking down proteids or protein substances, producing a great many so-called aromatic compounds, and among these, one of the most characteristic and most easily recognizable, is a substance known as indol. Because of the facility with which this indol may be recognized, the detection of the substance is usually

taken as the best indication of the presence of certain kinds of living forms of bacteria which bring about putrefaction, the test depending finally on the combination of a certain test solution with the liquid left in the tube or flask in which the incubation has taken place. This liquid is a solution of a nitrite, usually sodium or potassium nitrite, to which strong sulphuric acid is added. The test may be made in various ways; the sulphuric acid may be added in different amounts and under different conditions, but with the final result of bringing about a combination of the nitrous acid with the indol, yielding a marked red or pink color, the detection of which is very easy. The measurement of the extent of the organic contamination with these forms of bacteria depends on the observation of the extent of this color or the amount of this color. This method is one commonly followed by bacteriologists, and
6902 I believe need not be described in any greater detail, with perhaps this further word of explanation. The nutrient solution used in these experiments was a peptone belonging to the class of albumose peptones as free as possible from sugar. The certainty of this test depends to a considerable extent on the character of the peptone used. The most highly converted peptones in the market not being as well adapted to bringing about this reaction as those which contain more of the albumose products, because in the highly converted peptones or highly digested peptones the bodies left are of a type which are not readily decomposed by the bacteria, and certainly not with the production of indol. As this is a matter of some little importance I paid attention to the quality of peptone used, and in preference to Witte's peptone which has been very frequently used for this purpose, I employed a kind which is made in Chicago at the stock yards or by some one working at the stock yards industries, the quality of which answered the purpose very well.

Q. Are the results of those tests incorporated in the tables of analyses made by you at your laboratory from the water taken from the points heretofore testified to?

A. They are.

Q. Have you the tables prepared by you for the 1899 series of investigations?

6903 A. I have.

Q. In what form have you those tables with you?

A. I have these tables in printed form as they appeared in the report of the Illinois State Board of Health, a report printed by the authority of the Secretary of the State Board of Health. These tables are cut out from two volumes of this report and pasted on sheets of paper.

Q. Did you compare the original tables with the proofs before it was printed in the reports?

A. I did.

Q. Are the tables as printed in the report true and correct copies of your original sheets?

A. They are.

Q. Will you read each of the tables prepared by you for the period of 1899?

A. I will.

Q. How are your tables numbered, professor?

A. They are numbered from table 2 up beginning at Bridgeport. The first one that I have here is numbered 2.

Q. In Roman?

A. Yes Roman.

Q. Were these tables prepared by you in your official capacity as a member of the State Board of Health of the State of Illinois? 6904

A. They were prepared by me as chemist to the State Board of Health of Illinois.

MR. JEFFRIES: Objected to for the reason that the witness is not a member of the State Board of Health and was not at this time.

Q. MR. TODD: Were you employed by the State Board of Health to make these investigations?

A. I was.

Q. Will you read table 2, Bridgeport pumping station, as it appears on pages 12 and 13 of the Illinois State Board of Health report published in 1901?

MR. JEFFRIES; To the reading of which complainant objects for the reason that the original sheets made out in the office of the witness are the best evidence.

A. I read now table No. 2 giving results of the analyses from Bridgeport, through the season of 1899:

6905 TABLE II.—*Bridgeport*—

6920 THE WITNESS: I read next table No. 17, which gives the results of analyses of Spoon River water collected near Havana in 1899. I read next the table numbered 18, which gives the results of the analyses of Sangamon River water collected near Browning in 1899.

I read next table No. 19, which gives the results of the analyses of Illinois river water collected at Pearl, in 1899, tables 17, 18 and 19 being printed on the same sheet.

MR. JEFFRIES: The same objection is made, with the

†Rain; river high.

additional objection to the table referring to the Sangamon river taken at Browning, for the reason that there is no evidence showing that the samples were taken under instructions, and no evidence showing the manner of taking, so that the tables so submitted and the results of such analyses are misleading and unreliable and not competent evidence, and for the further reason that any analyses of water taken upon the tributaries of the Illinois river is immaterial, incompetent and not legal proof, having no bearing upon the issues involved in this controversy.

6928 Q. Have you a table of averages prepared from the preceding tables of analyses which you have read into evidence?

A. I have.

Q. By whom was this table prepared?

A. This table was prepared by myself.

Q. Is that table that you have a true and correct table of averages?

A. It is.

Q. Based upon the preceding tables of analyses?

A. It is.

Q. Prepared in the same manner as the other tables that have already been read?

A. It was.

Q. Will you read the table of averages for 1899?

MR. JEFFRIES: To the reading of which complainant objects for the same reason stated in the previous objections to the reading of tables, and for the further reason that the evidence shows a variable number of samples taken at the respective places and therefore the results obtained from such samples are not comparable with the average results obtained and for the reason that said table includes analyses of water taken from the the tributaries of the Illinois river, which is immaterial, incompetent and not legal proof.

THE WITNESS: I now read table 30, which gives the 6929 averages of the results of the analyses made in 1899 of the waters of the Illinois and Michigan canal at Bridgeport, and Lockport and the Desplaines river at Lockport, of the canal at Joliet; of the Kankakee river at Wilmington; of the Illinois river at Morris; of the Illinois river at Ottawa; of the Fox river at Ottawa; of the Illinois river at LaSalle; of the Big Vermillion river at LaSalle; of the Illinois river at Henry; of the Illinois river at Peoria at the points known as the Narrows or Averyville; of the Illinois river at Peoria at the point known as Wesley, or lower Peoria; of the Illinois river at Pekin; of the Illinois river at Havana, of the Spoon river at Havana; of the Sangamon river across from Browning; of the Illinois river at Pearl; of the Illinois river at Grafton; and of the Mississippi river at Grafton.

6931 MR. TODD: From a consideration of these tables of analyses as introduced by you, and the table of averages drawn from these tables of analyses, what conclusions do you draw as to the waters of the Illinois river?

MR. JEFFRIES: Complainant objects to the question for the reason that the tables containing the analyses of water taken from the tributaries of the Illinois river are incompetent, irrelevant and immaterial and do not tend to prove any issue involved in this case. The complainant objects for the further reason that the tables show samples of water as taken at variable times, and in a variable number, so as not to be comparable with each other and any conclusions or opinions that may be drawn therefrom would be misleading and erroneous, and for the further reason that there is no evidence showing that the tables of analyses of water from the tributaries of the Illinois river were properly taken. No evidence showing the manner in which they were taken; no evidence showing that instructions were given, or if given, were carried out, in taking the same, and for the reason that the question does not call for conclusions upon propositions involved in this controversy, and doesn't state upon what the conclusions are to be drawn or based, and is therefore indefinite and misleading.

A. From a consideration of the tables presented and from
the tables of averages drawn from these individual tables,
6932 these general conclusions may be reached:

First: That the first and most general examination of this table shows a very great diminution in the organic pollution of the Illinois river and its tributaries, and the source between Bridgeport and Upper Peoria or Averyville, a diminution of the organic matter which cannot be accounted for by the dilution from the tributary waters as shown approximately by the decrease in the chlorine contents. This discrease in organic matter is explained by a consideration of several factors. We find in considering the data given for oxygen absorption or oxygen consumption in the filtered water as well as in the unfiltered water, that between Bridgeport and Peoria there is a very marked decrease, a point being reached finally where the organic matter as disclosed by the oxygen consumption test does not appreciably differ from that found in the tributaries of the Illinois as shown by the same test. I find also a very marked decrease in the amount of the product indicated by the albuminoid ammonia, a decrease from over 3 parts per million to .57 parts per million. This last amount being not a great deal different from that found in several of the tributaries of the Illinois. I find also in considering this table a very marked change in the decrease in the amount of the so-called free ammonia, the decrease here being very nearly from 20 parts per million to less
than one part per million, this decrease being in a meas-
6933 ure, an index of the extent of bacterial oxidation or puri-
fication which has taken place in this part of the stream.
We observe also in the figures showing the amount of nitrogen

present in the form of nitrates, that a very great oxidation has taken place in the Illinois river, the nitrates resulting from the bacterial oxidation of the nitrogen which has previously existed in some other form and which has gone through the stage of free ammonia. We observe also the appearance of nitrites in considerable amounts in the lower stretch of this part of the river. The nitrites indicating also the advance of oxidation. A very noticeable feature of these tables is that after upper Peoria or Averyville, or the Peoria Narrows is passed, the condition of the river as disclosed by the analyses shows a very marked organic pollution again. We find that below Peoria the amount of organic pollution as measured by the albuminoid ammonia is very nearly as great s that observer in the canal at Bridgeport. We find also in passing Peoria that the free ammonia has increased from less than one part per million to over four parts per million. We find also that the figures measuring the oxygen consumption in passing Peoria have increased in the case of the unfiltered water from over six parts per million to over
17 parts per million, and the figure indicating the oxygen
6934 consumption in the filtered water has increased approximately
from 5 and one-half parts per million to nearly 13 parts per million. This remarkable increase in the numbers given shows that at this point a very great amount of organic matter has been added to the Illinois river. From the investigations which I have myself made at different times, an explanation of this increase is given. It is a matter of personal investigation and also of common knowledge that in the city of Peoria there are great industries which discharge waste of a highly organic nature into the Illinois river and the samples of water collected at Wesley were taken from a point below the discharge of these industries These industrial wastes are mainly from distilleries and from cattle sheds in which cattle feeding on the slops of these distilleries are kept, and from glucose factories. Coming down the river from Peoria we observe again as we did in coming down from Bridgeport to Peoria, a very marked gradual decrease in organic contamination. This decrease is observed in a gradual fall in the figures indicating the oxygen consumption in the filtered and unfiltered

water and in the free ammonia and in the albuminoid ammonia, so that a change takes place in the Illiniois river below Peoria, and is due to the same general causes, as indicated by the
amount and character of the products given here, as takes
6935 place in the river above Peoria, so that finally, at the
mouth of the river at Grafton, we have reached a condition in which the factors for organic pollution are not greatly different, or essentially different from those observed in the tributaries of the Illinois river. Taken as a whole, then, these tables disclose two main sources of contamination of the Illinois river, first, the sewage from the city of Chicago which decreases very greatly before Peoria is reached, and secondly the industrial wastes from the city of Peoria which decrease greatly before the mouth of the river at Grafton is reached. A consideration of these figures shows beyond any question whatever that the main factor in the contamination of the Illinois river at its mouth is not the waste or sewage contributed from Chicago, but the industrial waste contributed from the various industries of the city of Peoria.

MR. JEFFRIES: Now we move to strike out the answer to the question for the reason that the conclusions reached by the witness and contained in his answer are misleading, incorrect and not applicable to the conditions that exist in the Illinois river and that have existed since the opening of the Chicago drainage canal. We move to strike out the answer for the further reason that on account of the discharge of the Chicago
sewage into the drainage canal, mixed with the polluted
6936 water from Lake Michigan, making an increased flow of
approximately 250,000 cubic feet of water a minute in the Illinois river; that the conditions of the river from source to mouth have been so changed as to make the chemical analyses from which the witness has drawn his conclusions absolutely unreliable, misleading and of no value so far as the questions involved in this case are concerned. Removing the various means and processes of chemical changes in the river from the mouth to the source, is to make the testimony unreliable, and for the further reason that the statement and opinion of the witness with reference to the deposit of products in the Illinois river at Peoria by the various industries is shown by the evi-

dence to have decreased materially since the taking of the samples from which the testimony was given and that such deposits are continually decreasing at that point, therefore rendering such opinion worthless as testimony upon the issues involved in this case, and for the reason that the witness stated that certain deposits were made from glucose factories, when the evidence shows that the only discharge from the glucose factories of Peoria and Pekin is pure distilled water, mixed perhaps with a certain slight amount of sulphuric acid shown by the evidence of the witnesses at these points, the superintenents of the factories, that it was an infinitesmal part of one-one-hundredth per cent, and for the further reason that
6937 the witness has not stated that he was acquainted with the sources of pollution or with the precise amount and character of the pollution of the waters of the Illinois river, and for the further reason that the witness stated in his answer to the question that his deductions were drawn in part from information and belief and not based upon the tables to which the question referred.

MR. TODD: I move to strike out so much of the objection as is argumentative and is based upon a misstatement of the evidence already heard in this case, as not proper in the presentation of a legal objection.

Q. From the table of analyses made by you, how does the condition of the water in the Desplaines river at Joliet compare with the condition of the water at Wesley, below Peoria, for 1899, the time that you made this investigation?

MR. JEFFRIES: I object to the question for the same reasons stated in the motion to strike out the answer of the witness to the preceding question.

A. In comparing the results of the analyses made for the canal and the Desplaines river at Joliet, and the obtained analyses of the Illinois river water at Wesley, we see that the number for the albuminoid ammonia is greater at Wesley than it is at Joliet, indicating a larger amount of protein
6938 products, decomposable in the albuminod ammonia distillations at Wesley, than is found in the Desplaines river and canal at Joliet. We have also the albuminoid ammonia at Joliet, being measured by 2.88 per million, while that at Wesley

is measured by 3.2 per million. This average being drawn from individual experiments which are comparable in time and number. It is seen from comparing Joliet with Wesley, that we have at Wesley, as indicated by the oxygen consumption number, an amount of organic matter almost as great as at Joliet, in the filtered water. In the filtered water of Joliet, the oxygen consumption being 15.1 parts per million, while at Wesley it is 12.84 parts per million. In the water not filtered the oxygen consumption number is 25.9 parts per million at Joliet, and 17.44 parts per million at Peoria. As the waste of Peoria is known to be largely of a nitrogenous character, this difference in the numbers is simply and easily accounted for, the oxygen consumption number being relatively greater at Joliet, and the albuminoid ammonia numbers being relatively greater at Peoria; the albuminoid ammonia numbers measure most fairly the protein condition of contamination.

MR. JEFFRIES: I move to strike out the answer of the witness for the reason that there is no evidence to show what portion of the alleged reduction in organic matter is due
6939 to errors in sampling and the analyses.

A. (Continuing) The comparison of the water at Joliet with that at the Peoria Narrows is very instructive, the condition of the water at Joliet in every way being much worse than that at the Narrows.

MR. JEFFRIES: I move to strike out the answer for the same reasons and for the reasons stated in the objection to the next preceding question.

Q. MR. TODD: How do those two conditions manifest themselves in your analyses?

MR. JEFFRIES: The question is objected to for the same reason stated in the previous objection to the witness testifying from the tables introduced.

A. In my analyses the numbers given for oxygen consumption and for free ammonia and albuminoid ammonia, indicate at Joliet a very highly polluted condition, such as we find in the waters of marked sewage contamination, while at the Peoria Narrows the numbers given for oxygen consumption and free ammonia and albuminoid ammonia are not greatly different or essentially different from those which are found in the waters of the ordinary streams of the state of Illinois, not unreason-

ably contaminated, or not contaminated with anything more than is taken up by the passage of these waters through the soil
6940 rich in ordinary organic matters.

Q. How does the water at Peoria Narrows compare with the waters of the Fox river at Ottawa?

MR. JEFFRIES: I object to the question for the same reasons heretofore stated in objections to previous questions on this line, and for the further reason that a comparison of the waters of the Illinois river with those of its tributaries is immaterial so far as the issues in this case are concerned.

A. The water of the Fox river at Ottawa contains as indicated by the oxygen consumption test, practically as much organic matter as that contained in the Illinois river water at the Narrows, the average result showing a greater oxygen consumption for the filtered water of the Fox at Ottawa than for the filtered water of the Illinois at the Narrows. While the oxygen consumption results for the unfiltered water at Ottawa are slightly greater than for the unfiltered water at the Narrows, the free ammonia figure of the Fox river water at Ottawa is very much less than the free ammonia figure for the Illinois river water at Peoria, the free ammonia at this place, the Narrows, not yet having undergone complete oxidation. In the case of the albuminoid ammonia figures, the amount in the Fox river at Ottawa is almost as great as that of the Illinois river or canal, both figures being in the proportion that
6941 we find in the ordinary streams of the State of Illinois, flowing through soil containing a large amount of organic matter.

Q. How does the condition of the water at La Salle, Illinois, compare with the condition of the water at Pekin, Illinois?

MR. JEFFRIES: To which question the same objection is made as was made to the questions heretofore put, of the same nature.

A. By a consideration of the figures given for the analyses of the Illinois at La Salle and at Pekin, these relations are observed: The organic matter as indicated by the albuminoid ammonia at Pekin is very much greater than the organic matter indicated by the albuminoid ammonia at La Salle; the amount of free ammonia at La Salle on the contrary is greater than the free ammonia found at Pekin.

Q. What does that indicate?

A. That indicates that the oxidation of the free ammonia at La Salle has not gone as far as the oxidation of the ammonia at Pekin. In the case of the contamination as measured by the oxygen absorption, the condition at Pekin is very similar to that at La Salle, the numbers being very nearly the same.

6942 Q. How does the condition of the water at Peoria Narrows compare with the waters of the Illinois river at Grafton?

MR. JEFFRIES: The question is objected to for the same reasons heretofore stated.

A. In comparing the waters of the Illinois river at Peoria and the Peoria Narrows, and Grafton, we find as measured by the oxygen consumption figures and by the free and albuminoid ammonia figures somewhat more organic matter indicated at Peoria than at Grafton, but not a great deal more.

Q. How does the water at the Narrows compare with the water of the Mississippi river at Grafton for this period?

MR. JEFFRIES: I object to the question for the same reasons.

A. As indicated by the oxygen consumption test, the Mississippi river water at Grafton contains more organic matter than the Illinois river water at Peoria Narrows. As indicated by the figures for free ammonia, oxidation has gone very much further in the Mississippi river at Grafton than at the Narrows at Peoria. As indicated by the albuminoid ammonia test, the organic matter in the Mississippi river at Grafton is about eighty per cent of that in the Illinois river at the Peoria Narrows.

Q. How does the water of the Illinois river at Grafton compare with the Mississippi river at Grafton?

6943 MR. JEFFRIES: I desire to make the same objection.

A. As measured by the oxygen consumption test, the Mississippi river water at Grafton contains more organic matter than the Illinois river water at Grafton. As measured by the albuminoid ammonia, the Illinois river at Grafton resembles very closely the Mississippi river water at Grafton.

Q. How about the other determinations?

MR. JEFFRIES: I object to the question for the reasons heretofore stated.

A. The other determinations show that in the Illinois river water at Grafton we have evidence of a large amount of nitrogenous matter which has undergone oxidation. Nitrites for example at Grafton, or the Illinois river at Grafton, being nearly twenty times as great as the nitrites in the Mississippi river water at Grafton. We have also in comparing the Mississippi with the Illinois river at Grafton this fact, that of the unoxidized ammonia we have in the Illinois river about three times as much as in the Mississippi river water.

Q. From your analyses and tables, what do they indicate as to the oxidation of the sewage discharged through the Illinois and Michigan canal into the Desplaines river from the Bridgeport pumping works for that period?

6944 MR. JEFFRIES: To which question the same objection is made and for the further reason that the conditions have been so changed since these samples of water were taken in the Illinois river as to render this testimony unreliable, incompetent, immaterial and of no value.

A. From a consideration of all these tables and averages, the conclusion is a necessary one, that the organic matter discharged at Bridgeport into the canal and subsequently into the Illinois river, has undergone practically complete oxidation before the mouth of the Illinois river is reached at Grafton because at this last point we find no more organic matter than can be accounted for readily by that discharged from the tributaries and from the contamination at Peoria.

Q. Professor, have you made analyses of the Desplaines river water above Lockport?

A. I have.

Q. Are you acquainted with the Desplaines river above that point?

A. I am.

Q. Will you give the extent of your personal acquaintanceship with the river?

A. I am familiar with the Desplaines river from the point where it joins with the canal near Joliet, above Joliet, 6945 to a point many miles north of Chicago, where the river flows out from a certain swampy region. I am familiar with the towns on the river and the character of the drainage entering the river.

Q. Well, just describe the character of the drainage area, the names of the towns and whether those towns empty their sewage into the Desplaines river above Lockport.

MR. JEFFRIES: We object to the question for the same reason, that it is immaterial.

A. The Desplaines river is a sluggish stream which drains a number of suburban towns around Chicago. One of these is the town of Riverside, which is not far above the controlling works at Summit, north of Summit. The town of La Grange is also in part drained into the Desplaines, the sewage of La Grange flowing into a small stream, a small creek which in turn enters the Desplaines near Riverside. Above Riverside there are several towns located on the Desplaines, the drainage of which is taken up by that stream. Maywood is one and Norwood Park is another. The Desplaines furnishes the only outlet for drainage for these various towns, and when it becomes mixed with the canal water, it is not a potable stream and has not been in a great many years, not in twenty years.

Q. MR. TODD: At the point near where the Bear Trap Dam is located, which is at Lockport, have you made any
6946 analyses of the water there?

A. Yes, I have some figures here in this table for the Desplaines river at Lockport.

Q. Do your analyses show that that river would be a safe and potable river, or that the water of that river would be safe and potable for drinking purposes at that point?

MR. JEFFRIES: I object to the question as leading and immaterial.

A. I should not consider from these analyses that the water is a safe and potable water.

Q. MR. TODD: From your analyses and from your present knowledge of the Desplaines river above Lockport and of the towns that empty their sewage into the river, would you consider that a safe and potable river?

A. I would not.

MR. JEFFRIES: I object to the question and answer for the same reasons.

Q. MR. TODD: How large is the Desplaines river above that point?

A. The Desplaines river is extremely variable. At times of high water it carries a flood, but in dry seasons it is almost dry. It contains little more than the sewage from the towns draining into it.

ADJOURNED until 2:00 P. M. same day, Sept. 25, 1903.

6947 2:00 P. M., Friday, September 25th, 1903. Continuation pursuant to adjournment. Present, the Commissioner and same counsel representing the respective parties.

PROF. JOHN H. LONG,

resumed the stand for further direct-examination by Mr. Todd, and testified as follows:

Q. Professor, you have testified as to the chemical results of the 1899 investigation. What does the bacterial result, such as you explained that you made this morning, disclose as to the quality and conditions of the waters of the Illinois river and its tributaries?

MR. JEFFRIES: That question is objected to for the same reason given in the objection to the conclusions of the witness in the previous questions of the same character in reference to the same tables concerning the chemical results.

A. These bacterio-chemical results agree in a general way with the chemical results, in showing the condition of extreme organic contamination at Bridgeport, Lockport and Joliet, which show gradual improvement as we go down the river un-
6948 til Peoria is reached,—upper Peoria or the Narrows, or Averyville, as it is called, where the individual results obtained by the various methods which I referred to this morning do not differ essentially from similar results obtained from the tributaries of the Illinois. But leaving Peoria Narrows and going down to Wesley, we find as indicated by these bacterio-chemical results, great and marked increases of contamination again. The number of forms of organic matter in the organized condition, or living condition at lower Peoria or Wesley as

disclosed by what is called the colony count, is certainly as great as that found at Bridgeport, while the factors indicating the fermentation of carbo-hydrates by the bacteria present, and indicating the presence of those bacteria which convert carbohydrates into acids and coagulate milk are likewise as great at Wesley as at Bridgeport, so these bacterial results then in general, agree with the chemical results in showing an enormous increase of pollution, as Peoria is past, and these chemical bacterial results show as we leave Peoria and go down the river, a gradual diminution in the organized forms until the mouth of the river is reached at Grafton, where the number of bacteria present and the behavior of the bacteria with the reagents mentioned, show a condition similar to that found in many of the tributaries of the Illinois.

6949 Q. Have you the tables of analyses compiled by you from the chemical analyses of samples of water taken from the points heretofore testified to by you in the year 1900?

A. I have.

Q. Were these tables made in the same manner as the tables for 1899?

A. They were.

Q. Do these tables appear in the official record of the State Board of Health of Illinois, published in the report of the Illinois State Board of Health in 1901?

A. They do.

Q. Were these tables prepared by you and corrected in the same manner as the tables for 1899, as heretofore testified to by you?

A. They were.

Q. Do these tables correctly state the result of your analyses as made in the manner heretofore stated in your testimony?

A. They do.

Q. Will you read all the tables which you have prepared from the analyses of 1900, stating before each table the place where the samples of water were taken to make the analyses?

MR. JEFFRIES: To the reading of which said tables
6950 complainant objects for the reason that the original tables are the best evidence.

A. I have, in 1900, two sets of tables, one embracing examinations made shortly after the drainage canal was opened in the spring of 1900, and the other taking up a later period in the same year. I read first table 32, which gives the result of one examination of water from the Bridgeport Pumping station and Illinois and Michigan Canal made March 6, 1900.

I read next, table 33, which gives the results of the analyses of water from the large or main drainage canal, the water being taken at the Western Avenue bridge, between March 13th, and April 24, 1900. The results of these two sets of analyses are printed on the same sheet, which tables are as follows:

6951 TABLE XXXII.—

6956 Q. Have you the table of averages for the period covered by the tables which you have just read for work done by you in 1900, in the spring?

A. I have.

Q. Will you read the table?

MR. JEFFRIES: To the reading of which said table complainant makes the same objection as to the preceding questions.

A. I now read table 40, which gives the averages of the results of analyses made in the spring of 1900, of samples of water taken from the Illinois and Michigan canal at Bridgeport, the drainage canal at Western Avenue, and the Illinois River at Morris; from the Illinois river at Wesley; from the Illinois river at Havana; from the Spoon river at Havana; from the Illinois river at Pearl; from the Illinois river at Grafton, as follows:

6957 TABLE XL.—*Averages for Spring work*, 1900.

6958 MR. TODD: From this table of averages which you have just read, and the analytical tables which have been read by you, what conclusions are you able to draw from the tables thus presented, as to the condition of the water in the Illinois river during this period, at these various points?

MR. JEFFRIES: We object to the witness giving any conclusions or drawing any conclusions from the tables so read in evidence by him for the reason that the tables are not the best evidence, and therefore any conclusions drawn therefrom would be improper and of no value, and for the further reason that there is no evidence showing what portion of the alleged reduction in organic matter is due to errors in sampling, and in analyzing and there is no evidence showing what portion of the alleged reduction is due to actual reduction, and for the further reason that the tables show that the samples were collected at variable times and places and are therefore not comparable with each other.

Q. (Question repeated).

A. From these various tables I note that the amount of organic matter at Bridgeport in the old canal and the drainage canal at Western Avenue is less than disclosed by the previous analyses given in 1899. An exact comparison is however, difficult because of the fact that in this period, in the spring of
1900, the water flowed through both canals, through the
6959 Illinois and Michigan Canal and through the drainage
canal, but not at a constant rate, so that an exact comparison of these figures is difficult. However, as we proceed down the river to Morris, where there is a complete mixing of the waters, we find for the numbers representing the free and albuminoid ammonia a lower amount than disclosed in the analyses made in 1899. When Lower Peoria or Wesley is reached, there is here a very great increase in the figures for all constituents. In the factor representing the oxygen absorption, the free ammonia and the albuminoid ammonia the increase is very marked. Following below Peoria, we observe a decrease in these factors, representing or pointing to the amount of organic matter present. We find at Pearl that the factors for oxygen consumption and for albuminoid ammonia are as low as in the 1899 examinations in general, and as low as disclosed in the waters of many of the tributaries of the Illinois. We find at Grafton, however, below Pearl, for some reason which cannot be given, a slightly larger amount of organic matter in the mean, than at Pearl, but the point of greatest importance in this table is the very marked increase of the organic matter at Peoria and at Wesley, the point below Peoria, as compared with the amount found at points above during this same examination.

Q. How does the pollution in the Illinois river at Morris
6960 compare with the pollution in the Illinois river at Wesley, immediately below Peoria?

MR. JEFFRIES: That question is objected to for the same reasons stated in the objection to the previous question, and for the further reason that the chemical analyses of the two waters cannot be correctly used showing the amount of pollution without knowing the volume of the stream at the respective points of collection.

A. A comparison between the waters at these points is a fair one because they were collected through the same months, and shows this; that at Wesley, below Peoria, the organic matter as measured by the oxygen absorption and by the albuminoid ammonia and as indicated also by the results of the bacterio-chemical examinations, is greater than that found at Morris through the same period. Any increased dilution below Morris would tend to decrease rather than increase the contamination at Peoria, making it appear even more strongly. The organic matter is larger than at Morris.

Q. How does the condition of the water at Morris compare with the condition of the water at Grafton?

A. At Grafton, the various factors given in the table show a lower condition of contamination than at Morris, in practically all cases.

6961 Q. How did the condition of the water at Morris in 1899 compare with the condition at Morris in 1900?

MR. JEFFRIES: Objected to for the same reasons stated in the last previous objection.

A. At Morris in 1900, after the opening of the drainage canal the amount of albuminoid ammonia is very much less than the amount found in 1899, before the opening of the drainage canal. The factor for oxygen consumption in 1899, is, in the filtered water somewhat greater than for the filtered water in 1900, but for the unfiltered water slightly less.

Q. What would you say as to the general condition of the water at Morris for those two periods, 1899 and 1900, based upon your analyses?

MR. JEFFRIES: To which question the same objection is interposed as to the last two preceding questions.

A. I will say that the amount of organic matter present in 1900 is less than that present in the same volume in 1899.

Q. MR. TODD: And what does that indicate?

A. That indicates simply as stated, that the amount of organic matter is less one year than the other, to make that direct comparison.

Q. What was the condition at Wesley in 1900 as compared with 1899?

6962 A. At Wesley, in 1899, in the mean, as indicated by the albuminoid ammonia there was more organic matter present than in 1900, as indicated by the oxygen consumption; also somewhat more in 1899 than in 1900. The free ammonia at Wesley in 1899 is greater than that at Wesley in 1900.

MR. JEFFRIES: I move to strike out the answer for the reasons contained in the objection to the last preceding questions.

Q. MR. TODD: Does it show more or less pollution in 1900 than in 1899?

MR. JEFFRIES: That is objected to for the same reasons.

A. It contains less pollution in 1900 than it showed in 1899.

Q. MR. TODD: What was the condition at Havana during those two periods?

MR. JEFFRIES: Objected to for the same reasons.

A. At Havana, in 1899 the amount of organic matter as measured in parts per million by the free and albuminoid ammonia, was greater than in 1900, and the oxygen consumed shows a somewhat similar condition. The oxygen consumed is a little greater in the spring of 1900 than in 1899.

Q. MR. TODD: What does that show as to the amount of pollution for those two periods?

6963 MR. JEFFRIES: Objected to for the same reasons and for the further reason that the witness does not take into consideration the increased volume of water going down the river since the canal was opened.

A. As measured by the albuminoid ammonia, in a given volume of the water, the analyses showed that there is a greater pollution in 1899 than in 1900. While, as measured by the oxygen consumption the result for 1900 appears to be slightly greater than the result for 1899.

Q. MR. TODD: What was the condition at Pearl during those two periods?

MR. JEFFRIES: Objected to for the same reasons heretofore stated, and for the further reason that the witness does not take into consideration the increased volume of water that comes down the Illinois river since the opening of the drainage canal.

A. As measured by the oxygen consumption, the organic matter in parts per million is greater in 1900 than it is in 1899, but as measured by the albuminoid ammonia present, the contamination in 1899 is greater than that in 1900.

Q. MR. TODD: How does the river at Grafton compare in 1900 with the river at Grafton in 1899?

MR. JEFFRIES: Objected to for the same reasons as heretofore stated.

6964 A. Comparing the river through the summer of 1899 at Grafton, with that at Grafton through the Spring of 1900, we find that the condition at Grafton shows more organic matter from a given volume in 1900 than it does in 1899. This comparison, however, is made between the river at the time of high floods in the second year and through the summer conditions in the first year.

Q. From the analyses in 1900, made by you of the Illinois river, and the analyses of the river made in 1899, what in your opinion as a chemist, was the difference between the river in 1900 and 1899?

MR. JEFFRIES: That is objected to for the reason that the tables giving the result of the examinations purported to have been made, and as exhibited in evidence, are not the best evidence, and therefore any conclusions or reasoning that may be drawn therefrom would be unreliable, uncertain and not trustworthy, and for the further reason that in such analyses of the water the witness has not taken into consideration the volume of the water coming down the Illinois river during the various periods of examinations and has not taken into consideration the changes that have come in the Illinois river by reason of the opening of the Chicago drainage canal, which have changed materially the chemical operations of the water in the river and the chemical processes in the water.

6965 (Question repeated).

A. From the fact that these analyses which I last gave, made in 1900, were carried out in the spring of that year, when the waters in general were high, any comparison between the river at this time,—the lower stretches of the river at this time, with the lower stretches of the river in 1899, is impossible,—any fair comparison is impossible. The Illinois river in the spring of 1900 in its lower stretches shows the condition of the ordinary western rivers at the same time, irrespective of the source of their contamination. We have here the large amounts of free and albuminoid ammonia, and high figures for oxygen consumption which are found in the ordinary tributaries of the river. A comparison in this table is important mainly as it shows the increased contamination at Peoria, or Wesley.

MR. JEFFRIES: I move to strike out that part of the answer in which the witness undertakes to compare the water of the Illinois river with that of its tributaries, and with other rivers, for the reason that he has not shown in evidence sufficient data as to the chemical character of the waters of the tributaries of the Illinois river to give an opinion thereupon or to make a comparison of the waters of the Illinois river with those of its tributaries.

6966 Q. MR. TODD: Professor, will you please state the number of samples taken at the different places mentioned in the tables for the period during the spring of 1900,—February, March and April?

A. The number of samples collected from those points were as follows:

Illinois and Michigan Canal at Bridgeport,	1,
From the main drainage canal at Western Avenue bridge,	7,
From the Illinois river at Morris,	8,
From the Illinois river at Lower Peoria, or Wesley,	8,
From the Illinois river at Havana,	9,
From the Spoon river at Havana,	7,
From the Illinois river at Pearl,	8,
From the Illinois river at Grafton,	11,

Q. Have you the tables of analyses made by you from the various places testified to by you from which water was taken in the summer of 1900?

A. I have.

Q. The analyses were made in the same way that you have testified they were made in the previous examinations of 1899 and 1900?

A. They were.

6967 Q. Were the tables prepared in the same way that you have heretofore testified?

A. They were.

Q. And published in the report of the State Board of Health of Illinois for the year 1901?

A. They were.

Q. Are these tables true and correct tables of the analytical results obtained by you from the analyses of the samples

received at your laboratory in the manner as you have heretofore testified they were?

A. They are.

Q. Will you please read the tables?

MR. JEFFRIES: To the reading of which the complainant objects for the reason that the original sheets or tables upon which is recorded the result of the examinations, are the best evidence.

A. I now read table No. 42, which gives the results of examinations of the water of the Illinois and Michigan Canal at Bridgeport, collected in July, August and September, 1900, which table is as follows:

Illinois and Michigan Canal.

OXYGEN ABSORBED.		AMMONIA.		NITROGEN.		Nitrogen by Kjeldahl process......	Colonies—per cc....	FERMENTATION.		Coagulation of Milk.	Indol produced?....

6985 MR. JEFFRIES: We move to strike out the tables referring to examination of samples of water, the samples of which were taken at Kankakee, at Wilmington, from the Sangamon at Browning, from the Spoon river at Havana, and the Fox river at Ottawa, and the Vermillion river at La Salle, for the reason that said rivers are tributaries only of the Illinois river and an analysis of such water has no bearing upon the issues involved in this case, and for the further reason that there is no evidence showing the manner in which the samples were collected, and that instructions for the collection of the samples were carried out, if such instructions were given.

Q. MR. TODD: Professor, have you prepared and have you with you, a table of averages compiled from the analytical tables which you have just read in evidence, for the summer of 1900?

A. I have.

Q. Was that table prepared by you?

A. It was.

Q. Is it a true and correct table of averages based upon the analytical tables which have been read into evidence by yourself?

A. It is.

Q. Will you read that table?

MR. JEFFRIES: That is objected to for the same reasons as heretofore stated, that the table consists of a page from
6986 the report of the Illinois State Board of Health, and therefore it is not the original.

A. I now read table 62, which gives the averages from the results of the analyses made through the summer of 1900, of waters collected from the Illinois and Michigan canal at Bridgeport; from the main drainage canal at the Western Avenue bridge; from the main drainage canal or basin as it is called, at Lockport; from the mixed Desplaines and canal water at Joliet; from the Kankakee river water at Wilmington; from the Illinois river at Morris; from the Illinois river at Ottawa; from the Fox river at Ottawa; from the Illinois river at La Salle; from the Vermillion river at La Salle; from the Illinois river at Henry; from the Illinois river at the Narrows or the point known as Averyville or upper Peoria; from the Illinois river at the point known as Wesley, or lower Peoria; from the Illinois river at

Pekin; from the Illinois river at Havana; from the Spoon river at Havana; from the Sangamon river at a point near its mouth, opposite the town of Browning; from the Illinois river at Pearl; from the Illinois river above Grafton, and from the Mississippi river above Grafton, which table is as follows:

6987 TABLE LXII.—*Averages for Summer* 1900.

	Total solids	Loss on Ignition.		Oxygen Absorption.		Chlorine	Free Ammonia	Alb. Ammonia	Nitrogen in nitrates	Nitrogen in nitrites	Total nitrogen (Kjeldahl)

6988 Q. MR. TODD: Will you state the number of samples and the places where the same were taken, for the series of analyses which you made in the summer and autumn of 1900?

A. During the summer of 1900, analyses were made of the waters collected at these points:

From the Illinois and Michigan Canal at Bridgeport,	15,
From the main drainage canal at Western Avenue,	14,
From the basin of the main drainage canal at Lockport,	11,
From the mixed canal and Desplaines river water at Joliet,	15,
From the Illinois river water at Morris,	15,
From the Illinois river water at Ottawa,	15,
From the Fox river water at Ottawa,	3,

From the Illinois river at La Salle,	15,
From the Big Vermillion river water at La Salle,	3,
From the Illinois river water at Henry,	15,
From the Illinois river water at Peoria Narrows,	13,
From the Illinois river water at Peoria at the point called Wesley,	16,
From the Illinois river water at Pekin,	15,
From the Illinois river water at Havana,	15,
From the Spoon river water at Havana,	4,
6989 From the Illinois river water at Pearl,	14,
From the Illinois river water at Grafton,	17,
From the Mississippi river water at Grafton,	6,
From the Sangamon river water at Browning,	3,
From the Kankakee river water at Wilmington,	3.

Q. From the analyses made by you in 1900, and the table of averages read by you for that period, what do your analyses show the condition of the Illinois river and its tributaries to be as to pollution from Bridgeport to Grafton?

MR. JEFFRIES: We object to the question for the reason that the condition of the water in the tributaries of the Illinois river has nothing to do with the issues involved in this case, and for the further reason that there is no evidence showing that proper precautions were taken in collecting the samples of water from the tributaries, and there is no evidence showing the manner in which the samples were taken, and for the further reason that the statements were based on the tables introduced as secondary evidence, and are therefore unreliable, and for the further reason that the samples were never so collected as to obtain comparable results at the different points on the river where collected, and this witness has given no evidence which shows that he knows the volume of the stream flow at the
6990 time the samples were taken or collected, or at any rate, there is no evidence showing the weather conditions under which the samples were collected, with reference to local freshets, showers and the stages of the rivers, and no evidence showing that this witness has any information with reference to the extent of the sources of pollution.

A. These tables considered in comparison with each other, and a consideration of the averages of the tables for the work of the summer of 1900, show in general, to begin with, a lower initial contamination of the water at Bridgeport than was the case in the examinations of the waters made in the previous year, 1899. The tables show further, as we proceed down the river and canal from Bridgeport to Lockport and Joliet, and down the Illinois river proper a gradual and continuous diminution in the factors indicating the organic contamination, and to an extent which is very much greater than can be accounted for in any way by the amount of dilution coming in from the tributaries.

An examination of these tables shows first, in general, a marked reduction of organic matter as compared with the amounts present at the source of contamination,—Bridgeport, in the main drainage canal. At the Narrows above Peoria, the factors indicating the extent of organic pollution as drawn from the results of the oxygen consumption test, and the free 6991 and albuminoid ammonia tests are not greater than those found from an examination of the ordinary tributaries—from the ordinary tributary waters of the Illinois in this state.

We find also on further consideration of the table that after Peoria Narrows is passed and the next point is reached, a remarkable increase in the organic pollution again, as measured by the important factors already referred to, the oxygen consumption and free and albuminoid ammonia, this increase being in the free and albuminoid ammonia several hundred per cent. The figures for oxygen consumption increase are likewise very large. The increase, from the known nature of the contaminating material entering the river at Wesley, is largely nitrogenous, and hence the much greater increase apparent in the figures for free and albuminoid ammonia than that apparent in the figures for oxygen consumption. Below Peoria as we proceed down the river we observe a decrease again in these figures,—a decrease in the oxygen consumption by the water, a decrease or disappearance of the free ammonia, and a very marked decrease in the albuminoid ammonia at Pekin. At the points below Pekin there is but little further decrease in the albuminoid ammonia for the reason that we have reached here a condition in the amount of albuminoid ammonia which is comparable with that found in the ordinary rivers of the state, beyond which the reduction

6992 does not commonly proceed to a great degree, for the reason, that we have reached here the comparatively stable types of organic substances which are not much subject to reduction by the bacterial oxidizing agents. In the case of the free ammonia, however, as this substance does undergo change, we find a progressive improvement or disappearance by oxidation to the mouth of the river, the figure for free ammonia at Grafton being .07 parts per million.

In considering the indications given by the figures for the oxygen consumption we have a similar condition. Below Pekin there is a general, gradual decrease until Grafton is reached, where the figures for the oxygen consumption again have sunk to a point corresponding to those given by the waters of the tributaries entering the Illinois, and by waters of this type in general, which flow through soil containing a large amount of organic matter. These figures for oxygen consumption have reached a point which is not passed in the waters of this region when exposed to the contamination of ordinary organic substances of vegetable origin.

In drawing full comparisons in this table, it is necessary to make, to begin with, a calculation of the combined flow through the main drainage canal and the Illinois and Michigan canal.

6993 Inasmuch as the water reaches the Desplaines river at Joliet through two canals, carrying unequal portions, and drawing different kinds of water, it is necessary to make a calculation of this kind in order to have a starting point for the comparison. The calculation which I refer to is to determine what the constituents present would amount to on the supposition that all the water was carried through one channel instead of two, because in considering the points further down the stream, we are dealing with only one channel. In order to make a computation of this kind, I have taken from the published tables of the Chief Engineer of the Sanitary District the flows through the two canals at the periods in question, and have combined them in such a way as to obtain the total flow. Knowing the total flow in each canal and the chemical composition of the water in each canal it is a matter of arithmetical calculation to find what the content would be on the supposition that all of the water passed through one channel.

During the period in question, as deduced from the tables of the Chief Engineer of the Sanitary District, about sixteen per cent. of the flow was through the old, or Illinois and Michigan canal, and about eighty-four per cent. of the flow through the main drainage canal, and these figures were used in a calculation which I will next present, which, however, has not been carried out for all constituents but only for the most important ones.

6994 Assuming that all of the water passed through one channel the volume being equivalent to the volume flowing through the two channels, the constituents in that one channel would be this: Chlorine 23.5 parts per million. Free ammonia—

JUDGE SPRINGER: At what place is this?

A. This is the assumed entrance of the one channel at Bridgeport, supposing the water all went through one instead of through two.

Chlorine,	23.5	parts per million,
Free ammonia,	3.9	do.
Albuminoid ammonia,	1.13	do.
Oxygen consumption in unfiltered water,	7.46	do.

These numbers may be taken as representing then the composition of the total flow through the combined channels. It will be seen by comparing these numbers which I have just given, with those given for the water at Joliet, that there is a discrepancy in some of the figures. That discrepancy depends on this fact, that at Joliet in the basin there is not, or was not at all times, a perfect mixture of the Desplaines and main drainage canal water, and the old canal water, so that the results are somewhat dependent on the point there at which the samples
were taken, and at the times there at which the samples
6995 were taken. Because of that discrepancy the Joliet collection is not considered in the comparison that I wish to make. With this calculated composition of the canal on the assumption that the water all flows through the one channel, I have made some graphic charts which illustrate the variations in the amount of substances present, expressed in parts per million in the whole flow between Bridgeport and Grafton at the mouth of the river, these charts illustrating somewhat more

clearly and plainly the variation than do the figures as read from the tables. The first chart shows a decrease in the chlorine, which is a measure approximately, of dilution by tributary waters.

MR. JEFFRIES: I move to strike out the comparisons of the analytical results of the last named period with those previous periods for the reason that it is not responsive to the question and for the further reason that in such comparison the witness has not testified or shown himself possessed of sufficient data regarding the sources and extent of pollution of the Illinois river at the various points where samples were taken, and for the further reason that the tables from which the conclusions were drawn do not contain a sufficient number of examinations of water from the various places to enable a creditable conclusion or determination to be made, as to the chemical condition of the water, and for the further reason that the witness 6996 has not taken into consideration the change in the condition of the water since the opening of the Chicago drainage canal in January, 1900, as compared to its condition prior to the opening of the canal and has not taken into consideration the chemical changes in the water during those respective periods, and for the further reason that the samples from which the analyses were made were not taken at places and times so as to be comparable with each other, and we move to strike out all that the witness has said with reference to the volume of water flowing through the drainage canal proper and the old Illinois and Michigan canal for the reason that his information was obtained from sources other than such as is now in evidence, and that his testimony in respect to the source of his information cannot be considered as evidence. The publications from which he read and obtained his information are not competent evidence and no testimony on that subject has been introduced by defendants or called to the attention of the witness.

MR. TODD: In reply to part of the objections counsel for defendants desire to state that the facts assumed by the witness as given by the Chief Engineer of the Sanitary District will be verified by the Chief Engineer when opportunity is given to place him on the stand, and we would thereby establish the assumption made by the witness as to the flow from the drainage canal and the Illinois and Michigan canal.

MR. JEFFRIES: I suggest in response to counsel's suggestion that the information which the witness obtained 6997 from the Chief Engineer of the Sanitary District of Chicago, is not in evidence and so long as it is not disclosed, that the information which the witness has possession of, is the same as that which actually exists and which will be shown by said Chief Engineer when he comes upon the stand, and testifies, is not competent and is therefore unreliable and is an assumption which is erroneous and cannot be of any force.

Q. MR. TODD: Professor, I show you a chart and ask you if the chart was constructed by you from the tables?

A. It was.

Q. What does this chart indicate?

A. This chart represents the decrease in the chlorine present, expressed in parts per million, between Bridgeport and Grafton.

Q. What year?

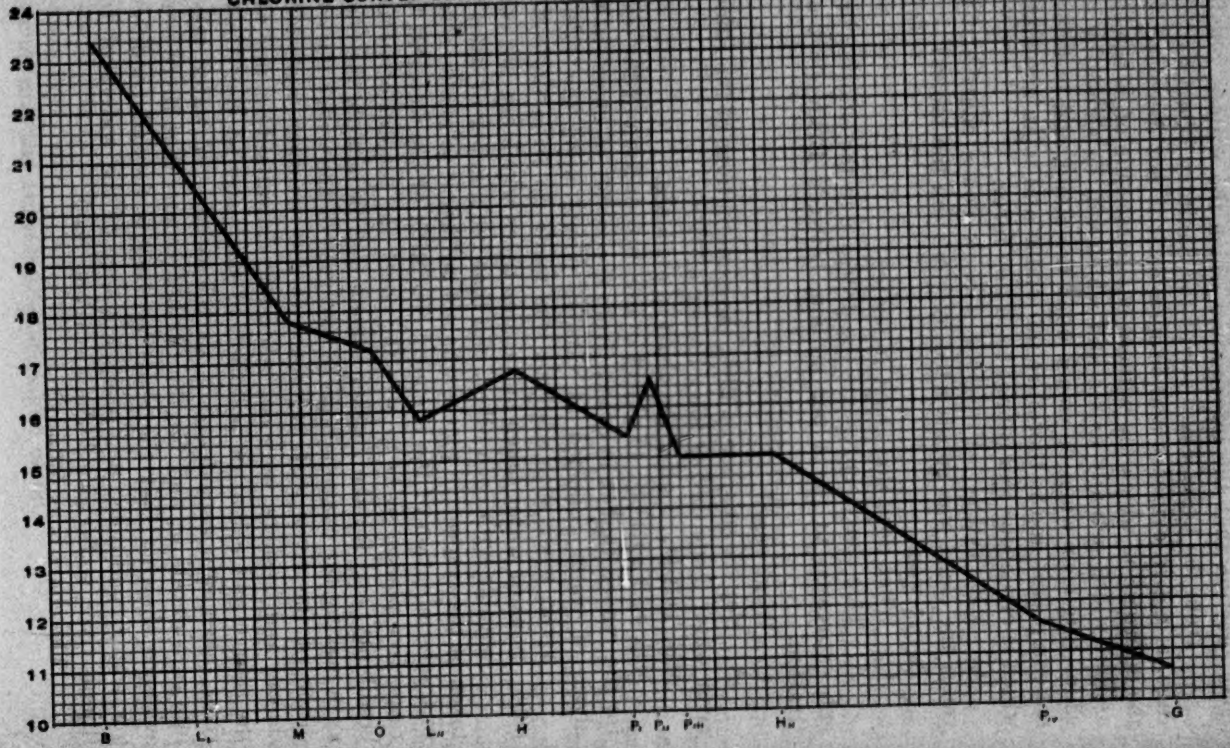
A. For the summer of 1900, the examinations of the Illinois river water made during the summer of 1900.

MR. TODD: I offer the chart in evidence.

MR. JEFFRIES: I object to the introduction of the chart for the reason that it is drawn from the result of chemical analysis of water collected at various points upon the Illinois river, when such analysis was made up from the collections of water taken at various times which are not com- 6998 parable with each other, and that the number of samples taken at the respective places was not sufficient to enable a correct determination of the chemical condition of the water at the respective places, so as to give the chart the respect of proper credibliity, and for the further reason that in making the chart as in making the examinations of analyses of the water the condition of the river with reference to the weather and local shower and freshets, were not taken into consideration, nor was the source and extent of pollution of the water of the Illinois river taken into consideration, or the volume of water taken into consideration; and for the further reason that there is no evidence showing that the chart represents flooded condition, low water conditions, or ordinary stages of the waters of the Illinois river, so far as chlorines are concerned.

The chart is as follows:

CHLORINE CURVE. ORDINATES=PARTS PER MILLION ABSCISSAS=DISTANCES



7000 Q. MR. TODD: Will you explain in detail all the figures and letters upon the chart which is introduced, and what their significance is?

A. This chart represents the change in the amount of chlorine present in the water of the canal and the Illinois river from Bridgeport to the mouth of the Illinois river at Grafton, assuming for the Bridgeport flow, the combined flow calculated as explained some distance back. The curve represents the amount of chlorine present in parts per million. The ordinates in this curve are vertical lines on the curves with the figures at the ends of these lines, which represent whole units of parts per million, starting from the base line of ten parts per million and ending at a line equivalent to 24 parts per million. The large abscissa space corresponds to a distance of fifteen miles, the equivalent to three miles for one of the small spaces. The letters at the bottom of the chart are initial letters of the points at which waters were collected for the examination. These letters being placed under marks proportionate to the distances of these points from Bridgeport.

B stands for Bridgeport. L_{1} representing Lockport; M. representing Morris; O. representing Ottawa; L_{11} representing La Salle; H. representing Henry; P_{1} representing Upper
7001 Peoria, or Averyville or the Narrows.

P_{11} representing Lower Peoria or Wesley.

P_{111} representing Pekin.

H_{11} representing Havana.

P_{1111} representing Pearl.

G. representing Grafton.

In this chart we have a decrease of the chlorine from Bridgeport to La Salle; an increase at Henry corresponding to the chlorine coming into the river at or below LaSalle from the industries there present, largely. A further decrease to Upper Peoria; a slight increase at Wesley, a decrease at Pekin; about the same amount at Havana, and a gradual decrease to the mouth of the river.

Q. What do the figures on the left hand side of the chart from 10 to 24 indicate

A. These indicate, or express the amount of chlorine present in parts per million, a long space representing one part per million and one of the short spaces one-fifth of one part per million.

Q. The chart which I hold in my hand represents what?

A. That chart represents the change in the amount of free ammonia present in the water between Bridgeport and
7002 Grafton, for the period of the summer of 1900, that chart being drawn from the average of the results of chemical analyses made through that period.

Q. Do the notations on the chart at the bottom indicate the same points as were described in the last chart?

A. They do.

MR. TODD: I ask to have this chart made a part of the evidence.

MR. JEFFRIES: The same objection is made to the introduction of this chart as was made with reference to the previous chart, with the statement that this chart applies to free ammonia found, while the previous chart applies to chlorine found.

Q. MR. TODD: Professor, will you explain the significance of that chart and what it indicates?

A. The base line or abscissas in this chart have the same significance as in the chart for chlorines, just explained. The ordinates represent the amount of free ammonia present at the different points, expressed in parts per million starting from the base line at zero, this chart shows that at Bridgeport we have nearly four parts per million of free ammonia, which decreases to about 2.8 parts at Morris, and still further decreases to Ottawa, and La Salle, and Henry, until Upper Peoria or
7003 Averyville is reached, where the amount present is less than .25 of one part per million. We have then an increase in the free ammonia at Wesley, to about 1.6 parts per million, and the decrease again to Pekin; about the same condition at Havana, and a gradual decrease until the mouth of the river at Grafton is reached, where the amount of free ammonia is less than .1 part—about .07 of a part per million.

Q. What does the chart indicate as to the ammonia above, at and below Peoria?

A. The chart indicates a very great decrease in ammonia from the starting point, until Upper Peoria is reached, and then a remarkable increase,—followed by a decrease to Pekin.

The chart is as follows:

7005 Q. I show you a chart for albuminoid ammonia. Was this chart prepared by you from your analyses of 1900?

A. It was from the results of analyses made in the summer of 1900.

Q. The notations on the chart at the bottom are for the points the same as testified to in the two preceding charts, are they?

A. They are, proceeding from Bridgeport to Grafton.

MR. TODD: I ask to have this chart made a part of the evidence.

MR. JEFFRIES: Complainant makes the same objection to the introduction of this chart as a part of the evidence, for the same reasons contained in the objection to the two preceding charts likewise introduced.

Q. MR. TODD: Professor, will you explain this chart and its significance?

A. This chart shows a variation in the amount of so-called albuminoid ammonia between Bridgeport and the mouth of the Illinois river at Grafton. The base lines, or the abscissa represent distance, one large place corresponding to a distance of fifteen miles, as already explained in the other charts. The ordinates represent the albuminoid ammonia expressed in parts per million, starting from the base line at zero, one long
7006 space corresponding to .1 of a part per million. We have, beginning at Bridgeport, the amount of albuminoid ammonia, calculated for the assumed flow of water through one channel in place of two, 1.13 parts of albuminoid ammonia per million. This amount decreases rapidly to Morris and then to Ottawa, where the amount found is below .4 of a part per million. A further decrease takes place at La Salle; then a slight increase to Henry, where the amount present is almost exactly .41 of a part per million. We have then a further slight decrease until Upper Peoria or Averyville is reached, where the amount reached is .34 of a part per million. From this point a very marked increase takes place at Wesley, at which point the amount of albuminoid ammonia present is 1.34 parts per million. This amount decreases again rapidly. At Pekin the amount found is below .5 of a part per million; it sinks to Havana, where the amount of .41 of a part per million is

reached. A slight increase is observed from here to Pearl where the amount present is found to be .43 of a part per million, and a further decrease to Grafton follows, where the amount is given as .36 of a part per million. The characteristic point in this table is the sudden and great increase of the albuminoid ammonia at Pekin, due to the introduction of fresh organic matter, essentially of protein character, and the rapid decrease as observed at Pekin is due to the remarkable condition of
7007 decomposition taking place in the stretch between Peoria
and Pekin which has been observable at periods before and after the opening of the main drainage canal.

The chart is as follows:

7009 Q. MR. TODD: I show you a chart entitled Oxygen Consumption curve, and ask you if you made this chart from your chemical analyses of 1900, the same as the three preceding charts were made?

A. This chart was so made, from the analyses of the summer of 1900.

Q. The notations at the bottom on the abscissas line represent the same locations where water was taken, as before testified to in the first chart offered?

A. They do.

MR. TODD: I ask to have this chart made a part of the evidence.

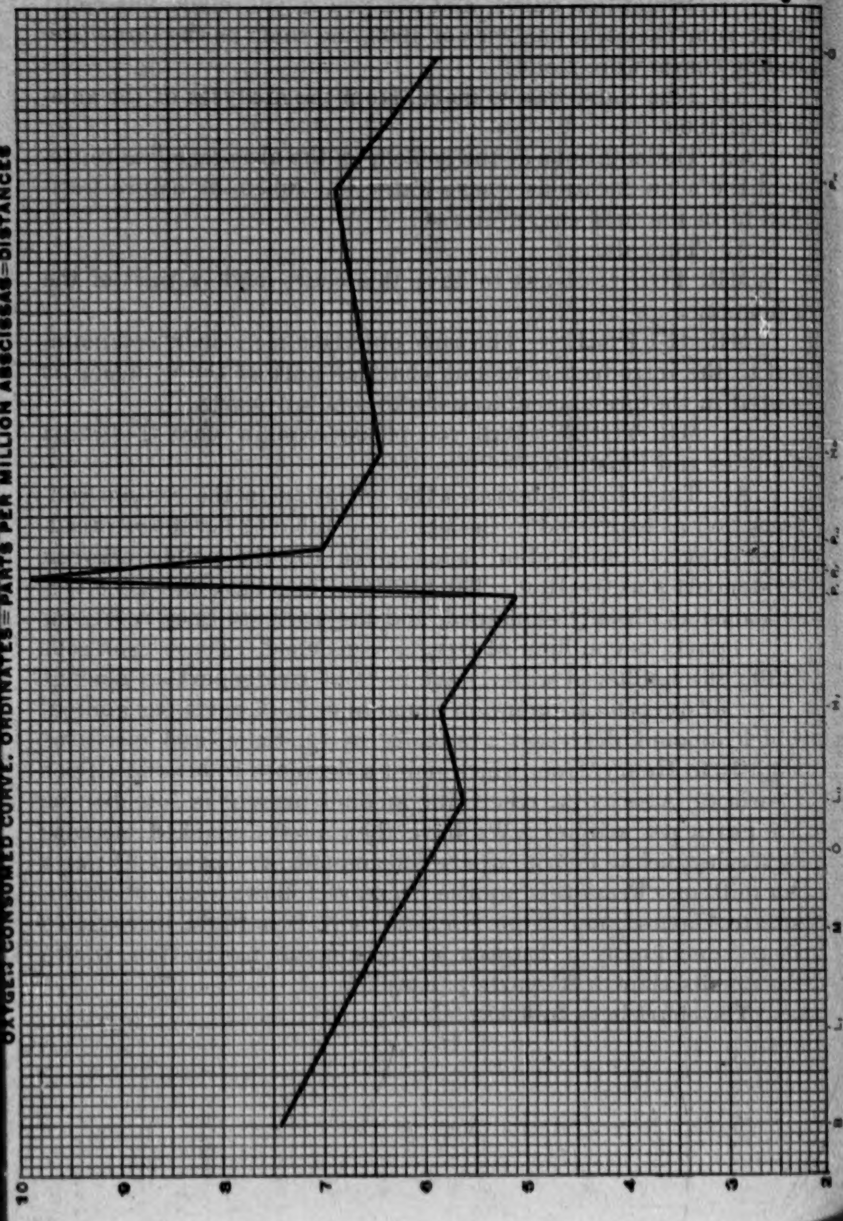
MR. JEFFRIES: The same objection is made by complainant to the introduction of this chart as part of the evidence as stated in the previous objections to similar charts.

Q. MR. TODD: Will you please explain what this chart signifies and illustrates?

A. This chart illustrates the variation in the oxygen consumption as expressed in the figures of table 62 heretofore read. This oxygen consumption being given for the points between Bridgeport and Grafton. The abscissa lines have the same significance as already explained, and the ordinate lines represent parts per million of oxygen consumed. These represent
7010 the unfiltered water. We have at Bridgeport an amount of oxygen consumption found to be 7.46 parts per million, which amount decreases gradually to La Salle, and increases slightly to Henry, from which point a decrease follows to Upper Peoria or Averyville, where the amount present is found to be 5.5 parts per million. We have then a very marked increase to Wesley, below Peoria, where the amount present is 9.91 parts per million. From this point a decrease follows again to Pekin, and to Havana, and from Havana there is a slight increase to Pearl, and finally a decrease in the amount to Grafton, where the results show 5.85 parts per million.

The chart is as follows:

7011



OXYGEN CONSUMED CURVE. ORDINATES=PARTS PER MILLION ABSCISSAS=DISTANCES

7012 MR. JEFFRIES: Now, we move to strike out all of the charts just offered as a part of the evidnece for the reason that there is no evidence showing what part of the alleged reduction in organic matter in each of the charts introduced, is due to errors in sampling and in analyzing, and what portion is due to actual reduction, on the ground that the evidence shows specifically the errors and irregularities in collecting samples at Joliet and La Salle during the period in which samples were collected for the analyses from which these charts are made.

Adjourned until 10:00 a. m., Saturday, September 26, 1903.

Met pursuant to adjournment, Saturday, September 26, 1903; whereupon a further adjournment was taken until 10 a. m., September 28, 1903.

7013 10:00 A. M., Monday, September 28th, 1903. Parties met pursuant to adjournment.

Upon telegraphic notice from Attorneys for complainant—the State of Missouri, of their detention by railroad wreck, the case was adjourned until 2:00 P. M., same day.

7014 2:00 P. M., Monday, September 28th, 1903. Parties met pursuant to adjournment.

Attorneys for complainant not being present, on account of the railroad wreck, an adjournment was taken until 10:00 A. M., Tuesday, September 29th, 1903.

7015 10:00 A. M., Tuesday, September 29th, 1903. Parties met purusant to adjournment. Present, the Commissioner and same counsel representing the respective parties.

JOSEPH WEIS,

recalled for further direct-examination by Mr. Todd, testified as follows:

Q. What is your name?

A. Joseph Weis.

Q. You have testified heretofore in this case have you not Mr. Weis?

A. Yes sir.

Q. Mr. Weis, do you know Mr. John E. Thome of the Bridgeport pumping works?

A. Yes sir.

Q. During the time that samples were collected by him who was it that went to the Bridgeport pumping works and got the samples which he collected and took them to the city hall, and took them to the University of Illinois, to Professor Palmer, and to the University of Chicago to Professor Jordan, and left the samples at the City Laboratory?

A. I did.

7016 Q. You handled all the samples collected by him?

A. Yes sir, I did.

Q. Now when you got the samples from him, what did you do with them?

A. Well, I left—as I did afterwards, I left the sample in our laboratory, and delivered one sample to the American Express Company for shipment to Champaign, Illinois, and delivered one sample to Professor Jordan of the Chicago University.

CROSS-EXAMINATION,

By Mr. Jeffries.

Q. Did you assist Mr. Thome in taking any of these samples?

A. No sir, never.

Q. How many did you carry from this place where they were taken, down to the laboratory?

A. On Saturday I delivered my boxes there and on Monday I went for the samples, and he usually took the samples in my presence, and sealed them in my presence.

Q. Did you assist him?

A. No, not at all.

Q. Well, how many times—how many trips did you make?

A. Well, I don't remember distinctly. It was once or twice a week.

7017 Q. For how many weeks?

A. Well, I don't remember. That must have been for three or four months, if my recollection don't fail me.

Q. You don't know how the samples were taken or anything about that?

A. Well, most of the time I was present. He took his bottles and dumped them right as the water comes out of the Bridgeport pumping station. It was mighty filthy.

Q. How long would it take you to get down to the city laboratory with them?

A. Oh, I should judge about twenty or twenty-five minutes.

Q. Do you know who received them there; who did you turn them over to?

A. I turned one sample over to the city chemist, and one sample to Dr. Gammon. There was a small bottle and a big bottle.

Q. Well, they were not always there to take them, were they?

A. No, they were not, but the bottles were sealed.

Q. I know, but who did you give them to there in the office?

A. I put the big bottle on the desk of the City Chemist, and the small bottle I put in the ice-box on ice.

7018 PROF. JOHN H. LONG,

resumed the stand for further direct-examination by Mr. Todd, and testified as follows:

Q. Professor, state your general conclusions from the work of the summer of 1900, as shown by the tables and charts offered in evidence, as to the character of the waters of the Illinois river and its tributaries?

MR. JEFFRIES: We object to the question for the reason that the witness has already answered, and for the further reason that the tables are not the best evidence, as stated in

previous objections, and for the further reason that the tables showed that the samples of water were taken at such times as not to be comparable with each other; also that a sufficient number of samples were not taken upon which to base a conclusion which would be reliable, and for the further reason that in the analyses, the witness did not take into consideration the volume or flow in the Illinois river, the source and extent of pollution in that river, and for the further reason that the conditions in the river have so changed since the opening of the drainage canal as to render any comparisons or general conclusions on examinations made prior to and subsequent thereto,
7019 unreliable and not trustworthy, and I also object to the
question because it includes the character of the water of the tributaries of the Illinois river, as incompetent, irrelevant and immaterial and has no bearing upon the issues involved in this case.

A. A consideration of all the tables presented, and of the charts drawn from them leads to this important and necessary conclusion: That in the flow of the sewage water from the pumps at Bridgeport through the drainage canal and subsequently into and through the river there is a very remarkable reduction or destruction of organic matter to Peoria; a great increase again between Peoria and Pekin, beyond which the reduction follows which continues to the mouth of the river, and at the mouth of the Illinois river as far as the organic content is concerned, the Illinois river is not more contaminated than are the ordinary tributaries, and rivers of this region flowing through a soil which contains large organic matter, and finally, and the most important conclusion to be drawn from these tables and charts, is that the main factor in contamination of the Illinois river is the addition of sewage, stock yards and distillery waste, of the city of Peoria.

MR. JEFFRIES: Now we move to strike out all the witness said with reference to the stock yards and distillery waste of Peoria for the reason that such statements are irrele-
7020 vant and incompetent, and for the further reason that the
number of samples of water examined by this witness, together with the continually decreasing amount of the de-

posits in the river at Peoria, do not justify conclusions of this character.

THE WITNESS: I wish to add that by stock yards of Peoria I mean the cattle sheds.

Q. MR. TODD: Professor, did you make any chemical surveys in 1901?

A. I did.

Q. And in the spring of 1902?

A. I did.

Q. At what points?

A. In the Illinois river above Grafton; in the Mississippi river above Grafton, and in the Missouri river above the mouth of that river, or the point where it flows into the Mississippi.

Q. Those were the points selected in 1901?

A. They were.

Q. At what time was this investigation made in 1901?

A. This investigation was made in 1901 between September—the last part of September and the middle of December.

Q. And when did you make the next investigation?

A. The next investigation was made in the spring of
7021 1902, through the month of February—part of February and March.

Q. At what points, professor?

A. At the same points. In the Illinois river above Grafton; in the Mississippi river above Grafton; in the Missouri river above the mouth of that river.

Q. Samples for these tests were taken in the manner that you have heretofore testified, and the tables have been introduced in evidence, have they not?

A. The samples were so taken and the cards or tickets describing the location and so on, have already been introduced.

Q. Were these analyses made different from the analyses made in 1900?

A. They were not.

Q. You have already described in your testimony the manner in which you made the chemical analyses?

A. I have.

Q. Have you the tables of the analyses made by you from the samples of water collected during this period at these different points?

A. I have.

Q. In what form have you the tables, professor?

A. I have these tables in the form in which they were printed by the authority of the Illinois State Board of 7022 Health, in one of the bulletins or reports of the Board of Health printed in 1902, under the direction of the secretary of the State Board of Health.

Q. By whom were these tables prepared?

A. These tables were prepared by myself.

Q. By whom was the proof for these tables corrected?

A. By myself.

Q. Are these tables which are printed in the advance sheets of the report of the Sanitary investigations of the Illinois, Mississippi and Missouri Rivers for 1902, by the Illinois State Board of Health true and correct tables of the analyses made by you?

A. They are.

Q. The printing was done under your direction and supervision?

A. The printing was done under the direction of the Secretary of the Illinois State Board of Health. The report was sent to the Secretary by myself and the proof was read by myself.

Q. And the tables as prepared are correct tables of your analyses based upon the samples which you analyzed in your laboratory?

A. They are.

Q. Will you read the tables of analyses made by you for this period?

7023 A. I now read table No. 1, which gives the results of the analyses of the water of the Illinois river taken above Grafton, between September 23rd, 1901 and December 12th, 1901, this table being printed on one sheet.

MR. JEFFRIES: We object to the reading of these tables for the reason that the original tables prepared by the witness are the best evidence. There is no evidence to show that the tables now being read are exact copies of the original tables, and no evidence showing that the corrections were made on the proof after reading by the Professor, as stated by him in his testimony about them being printed.

Q. MR. TODD: Are these tables exact copies of the original tables made by you?

A. They are.

Q. Proceed:

7029 THE WITNESS: I now read table No. 4, which gives the results of the analyses of the water of the Illinois river taken above Grafton between February 24th, 1902 and March 18th, 1902.

I next read table No. 5, which gives the results of the analyses of the water of the Mississippi river taken above Grafton, between September 17th, 1901 and December 12th, 1901. This table is printed on one sheet.

The Missouri River.

7031 Q. MR. TODD: Have you prepared from these tables of analytical data a table of averages?

A. I have.

Q. Was this table of averages prepared by yourself?

A. It was.

Q. Is it true and correct?

A. It is.

Q. Will you read the table of averages so prepared by you?

MR. JEFFRIES: We object to the reading of the tables of averages for the reason that the samples of water from which the analyses were made were not sufficient in number to enable any legal or competent conclusions to be drawn therefrom and for the further reason that in the analyses made by the witness, the question of volume of water, extent and source of pollution, of the various rivers, was not taken into consideration, and for the further reason that the samples from which the examinations were made were so taken as not to be comparable with each other.

MR. TODD: I suggest that the witness will not be called on for legal, but for chemical conclusions.

Q. MR. TODD: Does this table which you have prepared, show the averages for the spring and fall as based upon the tables which you have read?

A. It does; it is merely a compilation of the averages 7032 from the other tables.

Q. Will you read the table?

A. I now read this table of averages, from results of analyses of the waters of the Illinois, Mississippi and Missouri rivers, made in the fall of 1901, and the spring of 1902, showing solids in solution, solids in suspension; the loss on ignition in the filtered water, and the loss on ignition in the unfiltered water; the chlorine, oxygen absorption in unfiltered water, and oxygen absorption in filtered water; the free ammonia, and albuminoid ammonia; nitrogen in nitrates and nitrogen in nitrites, and the albuminoid ammonia shown by the Kjeldahl process; this all being printed on one sheet.

7033

	Illinois Fall	Mississippi Fall	Missouri Fall	Illinois Spring	Mississippi Spring	Missouri Spring
Solids in solution	229	145	346	220	186	304
Solids in suspension	52	39	948	216	93	1290
Loss on ignition, filtered	35	33	29	46	49	54
Loss on ignition, unfiltered	40	36	82	66	49	186
Chlorine	16.4	1.88	14.9	12.5	2.45	14.46
Oxygen absorbed, filtered	3.21	6.53	3.17	4.08	4.84	4.96
Oxygen absorbed, unfiltered	4.31	7.64	10.28	8.96	7.09	17.15
Free ammonia	0.236	0.07	0.10	1.344	0.244	0.295
Albuminoid ammonia	0.413	0.39	0.60	0.452	0.283	0.840
Nitrogen in nitrates	1.042	0.08	0.13	0.396	0.473	0.675
Nitrogen in nitrites	0.054	0.004	0.0006	0.002	0.003	0.011
Organic ammonia, Kjeldahl	0.81	0.74	1.61	1.46	1.24	3.27

7034 Q. MR. TODD: Professor, from this table of averages, what conclusions do you draw as to the relative pollutions of the Illinois river above Grafton, the Mississippi river above Gratfon, and the Missouri river, 600 feet above its mouth?

A. From a consideration of these several tables, I draw the following general conclusions:

That the organic condition of the Illinois river above Grafton, is very much better than the organic condition of the Missouri river above its mouth. This is shown by several factors. By the factor measuring the oxygen absorption, which for the Illinois river are for the unfiltered water, 4.31 parts per million, and for the filtered water, 3.21 parts per million. For the Missouri river, for the unfiltered water, 10.28 parts per million, and for the filtered 3.17 parts per million.

By the factor for the albuminoid ammonia, as measuring the substances of comparatively complex composition to be yet decomposed, 0.413 parts per million in the Illinois, as against .6 parts per million in the Missouri.

By the factor measuring the organic ammonia, as determined by the Kjeldahl process, which is .81 parts per million for the Illinois, as compared with 1.61 parts per million for the Missouri.

7035 As measured by the oxygen absorption, the Illinois river contains less organic matter above its mouth than does the Mississippi river.

As measured by the albuminoid ammonia, the Illinois river contains very nearly the amount of organic matter that is contained in the Mississippi river.

As measured by the organic ammonia determined by the Kjeldahl process, the amount in the Illinois river is not greatly different from that in the Mississippi river.

Considering the chemical reactions due to the living organic matter in the Illinois and the Missouri rivers, it is evident that the condition of the Illinois is very greatly superior to that of the Missouri, throughout the whole period. This is especially shown by the chemical determinations made to indicate the presence of those living organisms which decompose protein matters, with the production of indol. The reaction for indol is found at the mouth of the Illinois river above Grafton very rarely, while in the Missouri river 600 feet above its mouth, this reaction is extremely common, showing a very much greater number of the living organisms capable of bringing about this peculiar chemical decomposition in the Missouri river than are found in the Illinois river.

From the information obtained from the tests for the presence of those organisms, which have the power of breaking down carbo-hydrates, with the liberation of acid, 7036 which subsequently coagulates milk, it is likewise evident that the contamination in the Missouri river is very much greater than the contamination in the Illinois river through the same period. The number of acid forming organisms as disclosed by the results of the tests being greater in the Missouri than in the Illinois.

It also appears by a comparison of the tables in which a determination of the number of living organisms was made by the so-called colony count process, that the Missouri river shows a greater contamination than does the Illinois, through this same period. In its organic condition as indicated by these chemical tests which I have described as sometimes called bacterial, although they involve true chemical reactions, the Illinois river is as pure as the Mississippi at the point of junction of the Illinois with the Mississippi, and the Illinois river is very much purer than the Missouri at the point where the Missouri flows into the Mississippi.

When we turn to these results just given as applied to a comparison of the results for the fall of 1901, and when we turn to the results obtained in the spring of 1902, the same general conclusions follow. The indol reaction is more common in the Missouri river than it is in the Illinois.

7037 The purely chemical tests indicate the presence of a larger amount of organic matter in the Missouri river than is indicated in the Illinois.

Q. From your chemical analyses, is the Illinois river, during the period that this investigation was made, a more or less polluted stream than the Missouri for the same period?

MR. JEFFRIES: We object to the question because it is leading, and we object to the question further for the reason that any such comparison to be drawn by the witness with reference to the Missouri river, is incompetent, irrelevant and immaterial, and has no bearing on the issues in this case.

A. It is, beyond question, true, that at the period of this investigation the Illinois river at its mouth, was a much less contaminated stream than the Missouri river at its mouth.

Q. How did the Missouri river compare with the Mississippi river at the points where this investigation was made?

MR. JEFFRIES: Objected to for the same reasons.

A. As disclosed by the experiments described, the Missouri river is far more contaminated organically than the Mississippi at the points at which the samples analyzed were taken.

Q. Did you make any other analyses of waters aside from those you have already testified about, Professor?

A. I have.

7038 Q. What other waters have you analyzed in connection with this investigation?

A. I have examined the waters of the Kaw, and the Missouri rivers.

Q. Professor, are you acquainted with the Kaw river?

A. I am.

Q. To what extent are you acquainted with the river Kaw?

MR. JEFFRIES: I object to the question as immaterial.

A. I am familiar with the Kaw from its mouth for a distance of 100 miles or more west. I lived for a number of years on the Kaw, and have been on it at numerous points.

Q. At what points in the Kaw and the Missouri did you make this last investigation you are about to testify to?

MR. JEFFRIES: Objected to as immaterial.

A. This investigation was made in the Kaw at a point above its entrance into the Missouri; in the Missouri above Kansas City, and above also the confluence of the Kaw; in the Missouri below the entrance of the Kaw and finally in the Missouri below Kansas City.

Q. Who directed the location for the taking of samples?

A. I suggested and directed the locations.

Q. To whom?

A. To employes of the Sanitary District of Chicago,—Mr. Quinlan and Mr. Burke.

7039 Q. What instructions did you give to them?

A. I instructed those men to go to Kansas City with apparatus for collecting water, and collect a certain number of samples at these points which I have mentioned, in May, 1903.

Q. At each point how many samples were collected under your direction?

A. At each point I directed that nine samples be taken.

Q. In what manner?

A. That they be taken on three days, three samples on each day, a sample from the middle of each stream and from near the right and left banks, making a cross-section of three points

Q. Did you ever receive any samples from them?

A. I did.

Q. How were those samples marked, Professor?

A. Those samples were marked with cards placed in shipping envelopes similar to those which have been shown here already,—a shipping envelope containing the card being tied around the neck of the bottle in which the water was collected.

Q. How large were the bottles?

A. The bottles were gallon bottles.

Q. I show you 36 cards which have been offered as de-
7040 fendants' Exhibit 2, and ask you if these cards were the cards that accompanied the bottles of water which you analyzed?

A. These are the cards which accompanied the bottles.

Q. How did the bottles reach you?

A. The bottles were packed in shipping cases such as have been used in all previous examinations, and were sent by United States Express, to my laboratory at 2421 Dearborn street, Chicago.

Q. After the bottles arrived there, did you see Mr. Quinlan and Mr. Burke in your laboratory at any time inspecting the bottles?

A. I did.

Q. The bottles that you had there were the bottles that were collected by them?

A. They were the bottles which I shipped to them for the collection, which I prepared myself and shipped.

Q. And they were the bottles that had these cards on them?

A. They were.

MR. TODD: I will ask now to withdraw 35 of the 36 cards which are made defendants' Exhibit No. 2, and leave one card as a sample of the 36 cards, known as defendants' Exhibit No. 2, and ask that the one card be substituted for defendants' Exhibit No. 2, and offer the 35 cards remaining, for the inspection of counsel and if required, will offer them in evidence. 7041

MR. JEFFRIES: All of which is assented to, and I move to strike out the remaining card as an exhibit for the sole reason that it is incompetent, irrelevant and immaterial and has no bearing upon the issues involved in the case.

MR. TODD: I want to state that one of the purposes of introducing this evidence is to rebut the testimony given by Dr. Teichmann, as to the chlorine in the Kaw river, and upon that theory as well as others I claim the evidence is competent.

Q. After you received these samples of water, Professor, what analyses did you make—for the ascertainment of what organic constituents?

A. I used these waters for the determination of the amount of chlorine present.

Q. Did you make any other analyses of the water except that for chlorine?

A. No other special determinations.

Q. That was the purpose you had in view in selecting these samples, was it?

A. It was.

Q. Have you the volumes of the Kaw and the Missouri for this period?

7042 A. I have.

MR. JEFFRIES: Do you intend to ask him to give the volumes?

MR. TODD: Yes.

MR. JEFFRIES: I object to the witness answering the question unless he discloses the source of his information as to the volume of water in the respective rivers at this time.

Q. MR. TODD: Where did you get the volumes of the Kaw and the Missouri rivers for this period?

A. From the engineer of the United States Geographical Survey at Washington, by whom the gaugings are kept and reported.

MR. JEFFRIES:. I move to strike out the answer of the witness for the reason that he does not state that the information covers the volume of the water in the Kaw and the Missouri rivers at Kansas City, or at the places where the samples of water were taken.

Q. MR. TODD: At what point do these volumes apply, that you have?

A. For the Kaw, at the town of Lecompton, Kansas, and for the Missouri at a point a short distance above the city, where the gauge is read.

Q. Where is the town of Lecompton located?

A. Lecompton is a small town in Kansas on the Kaw,
7043 about forty miles above its mouth, no tributaries of any importance entering the Kaw below Lecompton; nothing but small creeks.

Q. To what periods do these volumes apply, Professor?

A. They apply to the period of examinations between May 20, and May 30th, 1903.

Q. Will you give the volumes of these rivers?

A. The volumes here are given in cubic feet per second.

For the Kaw,

May 24th,	51,000
May 25th,	49,600
May 26th,	39,100
May 27th,	63,500
May 28th,	72,200

The examinations do not proceed beyond those dates, so I will not read the other figures.

For the Missouri,

May, 22,	125,000
May 23rd,	145,000
May 24th,	184,000
May 25th,	198,000
May 26th,	226,000
May 27th,	242,000
May 28th,	310,000

Q. Cubic feet per second?

A. Cubic feet per second.

Q. Have you prepared a table of analyses for chlorine?

7044 A. I have.

Q. Made from these samples?

A. I have.

Q. Were these tables made by you?

A. They were.

Q. You have explained the method by which the chlorine test employed by you is made, have you not?

A. I have.

Q. Will you read the tables?

MR. JEFFRIES: Complainant objects to the reading of the results of such examinations into the record for the reason that it is incompetent, irrelevant and immaterial, and has no bearing upon the issues involved in this case.

General average, 12.31.				

MR. JEFFRIES: Inasmuch as counsel for defendants admitted that this testimony was offered in rebuttal to the testimony of Dr. Teichmann, we move to strike out the table just read in evidence for the reason that it is not shown that the conditions of the Kaw river at the time of the taking of the samples for the discovery of chlorine, were the same as the conditions at the time the samples that Dr. Teichmann examined were taken, as to volume, local showers, freshets and weather conditions, and I move to strike out the tables just read for the further reason that they are incompetent, irrelevant and immaterial, and have no bearing upon the issues involved in this case, and that proof of pollution of the Missouri river at Kansas City and other points does not justify the turning of the sewage of

Chicago through the natural divide between the water-sheds
of Lake Michigan and the Mississippi river, into the Illi-
7047 nois river and thence into the Mississippi.

MR. TODD: I desire to suggest in reply to the objection, that counsel does not offer this evidence solely to rebut the testimony of Dr. Teichmann, in view of the fact that Dr. Teichmann made no chemical analyses of the Kaw, but drew conclusions in regard to the condition of the Kaw from official reports, and this evidence is offered for other purposes aside from that one purpose, but for that purpose alone the evidence woud be competent, if for no other.

MR. JEFFRIES: I move to strike out the suggestion of counsel for the reason that he does not disclose the purpose for which the testimony is offered, and inasmuch as he states it is offered for a particular purpose we move to strike it out because that purpose is not disclosed to the court.

Q. MR. TODD: Professor, have you a table of averages drawn from these analyses?

A. I have.

Q. Has that table been read into evidence?

A. It has.

Q. How does the chlorine in the Missouri river above Kansas City and the chlorine in the Kaw and the chlorine below Kansas City, and at Kansas City, compare from these tables?

MR. JEFFRIES: This question is objected to for the same
reason stated in the objection to the question referring to
7048 the introduction of the tables just read in evidence, and
for the reasons mentioned in the motion to strike the
tables from the record.

A. The averages drawn from these tables show a considerably larger figure for chlorine below Kansas City, than in the Kaw or in the Missouri above Kansas City. The excess of chlorine below Kansas City being more than can be accounted for by any addition from the Kaw, and showing the fact that a certain proportion must come from the stock yards industries, and the sewers of Kansas City.

Q. How does the volume of the Kaw, that is the amount of chlorine in the Kaw, compare with the volume of chlorine in the Missouri river before it empties into the Kaw, and what effect, if any, does the increased volume of water in the Missouri river have upon the waters of the Kaw river after the two waters are intermingled?

A. The volume of the Missouri river is very considerably greater than the volume of the Kaw throughout this period, and the amount of chlorine in the Kaw, taking its volume into consideration cannot act to increase the amount of chlorine in the Missouri above the figure given for the Missouri above Kansas City.

MR. JEFFRIES: I move to strike out the answer for 7049 the same reasons mentioned in the objection to the preceding question.

Q. MR. TODD: In your analyses of the waters of the Missouri river in 1902, did those analyses disclose high chlorines in the Missouri river?

A. Relatively high, yes.

Q. How did the chlorines in the Missouri river compare with the chlorines in the Mississippi river?

A. The chlorine in the Missouri river is always much higher than the chlorine in the Mississippi river.

Q. Can the chlorines in the Missouri river be accounted for as being attributed to the Kaw river at the mouth of the Missouri river?

MR. JEFFRIES: We object to the question for the reason that it is incompetent, irrelevant and immaterial, and for the further reason that the witness is not possessed of sufficient data upon which to base or express an opinion, and has not given such data in evidence.

A. The chlorine at the mouth of the Missouri river can be attributed only in part to the chlorine of the Kaw river, the tables showing that the additions from Kansas City is an important factor.

Q. How did the chlorines in the Missouri river above Kansas City compare with the chlorines in the Missouri river below Kansas City at the point where samples were taken?

A. The analyses show considerably less chlorine above 7050 Kansas City than below Kansas City, at the time the examinations were made.

MR. JEFFRIES: We move to strike out the answer and question for the reasons stated in the previous objection.

Q. MR. TODD: How did the chlorine below Kansas City compare with the chlorines in the Kaw?

A. The chlorine below Kansas City is greater, considerably greater than the chlorine in the Kaw.

MR. JEFFRIES: I move to strike out the question and answer for the reason that the witness has not shown himself possessed of sufficient data to base a proper chemical opinion upon that subject, and for the further reason that the witness himself did not make the proper number of analyses in order to determine with any degree of accuracy, the chemical chlorine constituents of the water so as to be able to make any reliable comparison between the waters of the Kaw and the Missouri river, below Kansas City.

Q. MR. TODD: From your analyses of the samples taken, what is your opinion as a chemist as to whether you had sufficient data to draw these conclusions?

A. It is my opinion that I have sufficient data to draw a fair conclusion in this case.

Q. Was that your opinion before you ordered the samples taken?

A. It was.

7051 Q. How did the chlorine below Kansas City compare with the chlorine in the Missouri river at its mouth, in the examinations as made by you in 1902?

MR. JEFFRIES: We object to the quesiton for the reason that the conditions under which the samples were taken are not shown to have been the same or shown to have been taken under conditions which would be comparable with each other, and we object to the question for the further reason that the evidence showing pollution of the Missouri river is not justification for the Sanitary District of Chicago polluting the waters of the Illinois river by the discharge of the sewage from Chicago into it.

A. It is not possible or profitable to make comparison here because the samples were not collected at the same time or under identical conditions.

Q. MR. TODD: Professor, as a chemist, and from your chemical knowledge as well as your chemical examinations made of the Illinois, Mississippi and Missouri rivers, what is your opinion as to whether any portion of the original organic matter of the sewage from Chicago finds its way into the intake tower of the water works of St. Louis?

A. From all the examinations I made of the Illinois river and its tributaries, it is my opinion that no part of the original organic matter leaving Chicago through the Sanitary 7052 canal, and finding its way into the Illinois river, can reach the mouth of the Illinois river, and much less the intake tower of the St. Louis Waterworks.

Q. Will you state whether or not in your opinion as a chemist and from your analyses of these waters, the Illinois and Mississippi and Missouri rivers, the water supply of St. Louis is contaminated, polluted or injured from a sanitary standpoint, by the Chicago drainage canal and the sewage emptied into it from the City of Chicago?

A. It is my belief that the sanitary condition of the water supply of St. Louis is not and cannot be injured by any pollution passing through the drainage canal from Chicago to the Illinois river and down.

Q. Is the volume of water going down the Illinois river greater or less than it was before the opening of the drainage canal?

A. The volume is now greater than it was before the opening of the drainage canal.

Q. What has been the effect of this greater volume of water in disposing of the sewage of Chicago?

A. As the sewage is disposed of in two general ways, practically, by dilution and by oxidation, or chemical destruc- 7053 tion through bacterial means—inasmuch as the volume of water is greatly increased, the diminution of the sewage for a given volume, per cubic centimeter, for example, or per liter, is necessarily less, and inasmuch as at the same time with this new dilution there is no decrease enforced in the bacterial activity throughout the channel, so there can be no decrease in the purification from those causes. We have remaining, the diminution of organic matter by dilution, making the final effect better rather than a worse condition of the river.

Q. Are you acquainted with the Illinois river in flood time?

A. I have seen the Illinois river several times in high water, in flood periods.

Q. What effect do the flood periods in the Illinois river have upon the river?

A. Well, the effect of very high water in the Illinois river is a complicated one. The floods carry into the river an immense amount of organic matter from all the tributaries and numerous living organisms or bacteria which are practically always associated with this organic matter. The floods in general, from the gathering up of this large amount of organic matter, have the effect of increasing the organic contamination, irrespective of any original contamination which may
7054 have been present. A further effect of these floods, inasmuch as the banks of the Illinois river are very low, is to spread an enormous volume of water over an area of many hundreds of thousands of acres, providing for the sedimentation and oxidation to a marked degree, of the matters carried by the waters at these periods. The conditions in the Illinois river because of the peculiar character of the banks, are unique in this respect. The overflow disposes in this manner of a vast amount of organic matter, which in a stream with high banks would have to be carried forward. The great overflow area provides numerous settling and purification basins in the Illinois river.

Q. If the increased waters at flood time, from the tributaries of the Illinois, and the Illinois itself, cause a large area of land to overflow along the Illinois river valley, what effect does this overflow have upon sedimentation and sewage from Chicago entering the Illinois river by way of the drainage canal?

A. Inasmuch as by far the largest volume of the water at flood time, leaves the natural channel of the Illinois river, and is distributed through a vast area of land, as a matter of necessity, any original sewage or remnants of sewage carried by this water must be in a like manner, so distributed and delivered into
7055 a condition for purification by sedimentation or oxidation.

Q. Are you acquainted with the physical character of the Illinois river as it exists today, and as it has existed for the last five or six years?

A. I am.

Q. Are you acquainted with the lakes between Chicago and Grafton on the Illinois river?

A. In a general way I am acquainted with those lakes, without being able to give their names. I know the locations where many of them are found.

Q. Are you acquainted with Lake Joliet?

A. I am.

Q. What effect has Lake Joliet upon the waters of the Desplaines river, after it receives the sewage discharged through the drainage canal?

A. Lake Joliet has the general effect of offering a large basin for oxidation, and has the effect of holding up the water to some extent, for that purpose.

Q. Is that true of all the lakes upon the Illinois river?

A. It is true for most of the lakes in a far greater degree than Lake Joliet, which is in a measure hemmed in and limited in extent. These lakes, extensions and widenings of the Illinois river below Henry and particularly below Peoria and
7056 the region around Havana, north and south of Havana,
and in fact for the whole region practically between Havana and Beardstown, these widenings or lakes in the river provide very important agencies in the disposition of organic matter at flood time, and also to some extent at the time of low water, because some of them communicate with the river at all periods.

Q. Do you know how many dams are on the Illinois river, along the Illinois and the Desplaines river, from Lockport to Grafton?

A. Yes, I think I can give the number there. To begin with the dam at the end of the main drainage channel, now known as the Beartrap Dam. We have also at the present time, I believe, two dams in Joliet, and a dam is also located at Henry, and another at a point below Pekin some distance, called Copperas Creek. Further down the river at La Grange is one at Kampsville, I believe. That's all.

Q. Are you acquainted with the dam at Marseilles?

A. I am not well acquainted with that. I recall having been once there. I left that out.

Q. What effect have these dams on the Illinois river in the way of acting as purification agencies?

A. These dams in the Illinois river are extremely important factors in holding up the water, retarding its rate of
7057 flow; distributing it over a wider area, and therefore of
importance in hastening general purification.

Q. In what way, Professor?

A. They are important because of the effect which I have mentioned, that they serve to distribute the water over a greater superficial area and retard its rate of flow.

Q. Now can you state whether or not from your chemical examination of the Mississippi river throughout the time of these examinations as testified to by you, that the Mississippi river at the chain of rocks,—at the Illinois shore opposite the chain of rocks, was a potable river and fitted for use for drinking and domestic purposes?

A. It is my belief that the Mississippi river is not at that point a potable stream, and fit for drinking purposes, household use.

Q. Was it a river furnishing a suitable supply of drinking water for domestic and drinking purposes prior to the opening of the drainage canal?

MR. JEFFRIES: I object to the question for the reason that the witness has not testified to any chemical analyses of the water of the Mississippi river made by him prior to the opening of the drainage canal.

A. The Mississippi river was not at any near period a suitable river for household use.

7058 Q. Have you analyzed the waters of the Mississippi prior to the opening of the drainage canal?

A. Yes, on several occasions, I made numerous analyses of the Mississippi in years back.

MR. JEFFRIES: I move to strike out the last question and answer for the reason that there was but one analysis of the Mississippi river made prior to the opening of the drainage canal, by this witness, and the witness has not yet disclosed any other analysis so made by him, the manner of the analysis or the manner of taking, or the number of analyses, or that he has possessed any sufficient data that is necessary in order to form a competent opinion on the subject, and for the further reason, I move to strike out the last question and answer,—that since the testimony is not competent or relevant to the issues involved in this case, and the condition of the water of the Mississippi river, whether potable or non-potable, does not offer or extend to Chicago the privilege or permission of discharging its sewage, by means of the Sanitary District of Chicago, into the Illinois river and thence into the Mississippi.

MR. TODD: Since the opening of the drainage canal, what has been the effect of the turning of the waters of Lake Michigan through the drainage canal into the Illinois river, upon the sanitary quality of the water in the Illinois river?

7059 A. Because of the addition of a large volume of Lake Michigan water to the canal water flowing down the Illinois, and because further, the increase in the amount of pure water, is very much in excess of the increase in the amount of sewage carried at the same time, the resultant effect is produced that the mouth of the Illinois river today, is in a far better sanitary condition than obtained before the drainage canal opened.

MR. JEFFRIES: I object to the answer and move to strike it out, on the ground that it is based upon analytical data prepared by the witness from samples of water taken from the Illinois river and that such samples were taken at various times without reference to local conditions, the volume of water, and taken in such a manner as not to be competent, and that in the analyses made by this witness, the volume of water was not considered a source of pollution and the extent of pollution was not considered as an element of the analyses.

MR. TODD: Taking into consideration all the knowledge that you have upon the question of the quality of the water of the Illinois river, has the sanitary condition of the water of the Illinois river been improved or damaged by the opening of the drainage canal?

MR. JEFFRIES: I object to the question for the reason that it does not include therein the element of the increased volume of pollution, and therefore the increased volume of 7060 pollution being discharged from the Illinois river at its mouth at Grafton into the Mississippi river.

Q. (Question repeated).

MR. JEFFRIES: And I object to it for the further reason that the answer to the question would be misleading and erroneous, and not applicable to the issues involved in the case.

MR. TODD: I would suggest that counsel cannot determine the sex of the child before it is born, and the answer itself will disclose whether it is misleading or not.

MR. JEFFRIES: In answer to the counsel for the defendants, I will submit that the witness has already produced the child.

A. Taking into consideration all the conditions which have been supposed, and especially the condition of the increased pollution I am still of the opinion that the sanitary condition of the water of the Illinois river at its mouth has been improved instead of injured by the increased flow through the drainage canal.

MR. TODD: Since the opening of the drainage canal, what is your opinion as to whether the waters of the Illinois river are more or less sanitary than the waters of the Missouri or the Mississippi rivers?

MR. JEFFRIES: I object to the question for the reason
7061 that the sanitary condition of the water in the Missouri river, or the Mississippi river above Grafton, has no bearing upon the vital issues in this case.

A. Beyond all possible question the sanitary condition of the Illinois river at its mouth is far superior to the Missouri river at its mouth, and not greatly different from the condition of the Mississippi river at a point where the Illinois and Mississippi rivers unite.

MR. JEFFRIES: I move to strike out the answer for the reason that the witness states that the condition of the water in the Mississippi river above Grafton is better than that of the Illinois river since the opening of the canal at Grafton, for the reason that the witness in his answer has not taken into consideration the increased volume of polluted water entering the Mississippi river at Grafton, from the Illinois river, therefore increasing the amount of pollution entering the intake at St. Louis.

Q. MR. TODD: What effect does the sewage discharged through the drainage canal have upon the waters of the Mississippi river and Missouri river at the chain of rocks?

A. As I have not made any analyses at the chain of rocks, the question ought to apply to some other point.

Q. Changing from the chain of rocks to the point where the Missouri and Mississippi rivers mingle, at the mouth
7062 of the Missouri?

MR. JEFFRIES: I object to the question for the reason that the evidence shows that samples from which examinations were made by this witness and upon which this opinion was based, were not so made as to be competent, and in the examination of samples of water taken from the various rivers, the extent and source of pollution of the various water, and the volume of water, were not considered by the witness.

A. As I have stated in my previous testimony, I believe the effect of the Chicago sewage is completely lost before the mouth of the Illinois river is reached, and therefore cannot be a factor in determining any pollution in the Mississippi or Missouri rivers.

Q. MR. TODD: Assume that the waters of the Illinois river in 1902 were emptied directly into the Missouri river at its mouth, before the Missouri river enters the Mississippi, or before the Illinois empties into the Mississippi, would the waters of the Illinois river pollute the waters of the Missouri river?

MR. JEFFRIES: I object to the question for the reason that it eliminates entirely the mixing and dilution of the waters of the Upper Mississippi.

A. No; on the contrary the water of the Missouri will
7063 contaminate the water of the Illinois, the water of the
Illinois being in a purer and better sanitary condition at
that time, than the water of the Missouri.

MR. TODD: Q. Professor, assume that 107 barrels of 40 gallons each of culture of bacillus prodigiosus, consisting of one thousand million bacilli per cubic centimeter as contained in said barrel, were deposited into the Chicago drainage canal at the town of Lemont on the afternoon and evening of the 6th day of November, 1901, during a period of from four to eight hours; assume further, that immediately after said barrels were emptied into the drainage canal at the point aforesaid, the laboratories established at Lockport, Joliet, Peoria and Grafton on the Illinois river; at the intake tower of the St. Louis waterworks at the chain of rocks, were notified, and that samples were collected at each of these places every hour of the day and night, for the purpose of bacteriological analyses for the ascertainment of these bacillus prodigiosus, and assume that at Lockport these hourly samples taken day and night, were taken from November 7th to November 25th, a period of eighteen days; the total number of samples taken being 432 or thereabouts. Assume that at Joliet these hourly samples taken day and night,

were taken from November the 7th to November the 25th, a period of eighteen days, the total number of samples being 432,
and assume that at Peoria these hourly samples taken
7064 day and night from November 8th to November 30th, a
period of 22 days, amounting to a total of 528, and assume that at Grafton these hourly samples were taken day and night from November 12th to December 15th, a period of 33 days, the total number amounting to 732, of which 384 were analyzed by Dr. Ravold, and assume that the total number of samples taken hourly day and night was 720, and assume that at the laboratory tap these hourly samples taken day and night from November 20th until March 1st, 1902, a period of 100 days, amounting to a total of 2400, and assume that the total number of samples analyzed at the different points for the period above mentioned was 5,304; and assume further that on December 4th, at 8:45 A. M., one bacterium-bacillus prodigiosus was found at the intake tower at the chain of rocks; assume that on December the 5th, at 9:00 A. M. one bacterium bacillus prodigiosus was found at the intake tower at the chain of rocks; assume that on December the 8th at midnight, one bacterium bacillus prodigiosus was found at the intake tower at the chain of rocks; assume that on December 6th, at 8:00 A. M., at Grafton one bacillus prodigiosus was found; assume that on December 7th at midnight at Grafton one bacillus prodigiosus was found; and assume further that these five organisms were all of the organisms of prodigiosus that were found in the examinations made
from Lockport to the intake tower at the chain of rocks,
7065 and the laboratory tap in the city of St. Louis, which
were made during the progress of this investigation as hereinbefore set forth; that at no time was there more than one bacterium found in each of these places. Assuming all of the facts as hereinbefore stated to be true, what is your opinion as to the value of this experiment as indicating the probable longevity of the typhoid bacillus as measured by the longevity of the bacillus prodigiosus, and the probability that a typhoid bacillus entering the drainage canal from the sewers of Chicago would ultimately find its way through the Desplaines and Illinois rivers to the town of Grafton?

MR. JEFFRIES: I object to the question for the reason that the witness is not a bacteriologist, or at least has not qualified as such, and for the further reason that the question assumes a fact not in evidence, or rather fails to assume all the facts of the investigation upon which the hypothesis is stated; particularly in this: that it assumes that every particle of each respective sample of water so examined was examined with a view of determining the presence of prodigiosus, when as a matter of fact, only one cubic centimeter of said water was so examined, and I object to the question further because the witness has not shown any knowledge or acquaintance with the bacilli prodigiosus, or the typhoid fever bacillus, and if he is possessed of such information, he has not stated it in evidence as a part of his professional experience.

7066 A. Considering the longevity of the typhoid bacillus as measured by the longevity of the bacillus prodigiosus, which consideration in no way involves a knowledge of bacteriology, but simply a knowledge of arithmetic as set forth in this question, I would say that the suppositions advanced in this question indicate that the longevity of the bacillus prodigiosus, and of the typhoid bacillus as compared with it, is so extremely slight as to make the probability of a germ of this character being able to survive a passage from the drainage canal to Grafton, so remote as to be entirely unworthy of consideration. This conclusion depends on certain calculations which I have made and which I will present. As the various data are given in terms of the metric system, it is necessary to make certain reductions, in order to be able to reach a proper comparison. First, it is necessary to determine the concentration of the germs in the canal water at the time when they were dumped from the barrels as supposed in the question. At this period the flow in the canal was almost exactly 235,000 cubic feet per minute, which I have reduced to liters by use of the factor 28.3 liters per cubic foot, which is almost the exact factor, giving 6,650,000 liters, very nearly, per minute. Reducing this number of minutes to hours I find that for four hours or 240 minutes assumed to be consumed in this addition of the bacteria to the water, a

7067 volume of water flowed equivalent to 1,596,000,000 liters or approximately 1,600,000,000 liters. As the calculations are finally based on the cubic centimeter rather than the liter, I have reduced this volume to cubic centimeters by multiplying

by 1,000, giving as the volume of this water in cubic centimeters, into which the substance from the barrels was dumped, 1,600,000,000,000, or expressed most accurately in the method now common among mathematicians, 1.6×10^{12}. This is the flow of the canal in cubic centimeters in four hours. I will say for the purposes of comparison it makes no difference whether we assume four hours or eight hours, as the same factor enters later into the calculation at the mouth of the river. We have next to consider from the assumptions of the question the number of bacteria mixed with this volume. 107 barrels, of forty gallons each, gives the amount of 4,280 gallons, which, when reduced to liters give us something over 16,000 liters, 16,017 and more liters, but in round numbers I will use 16,000 liters, or 16,000,000 cubic centimeters. The number of bacteria per cubic centimeter, according to the assumption of the question, was 1,000,000,000. The total number of bacteria then discharged would be the product of 1,000,000,000 per cubic centimeter, by the number of cubic centimeters, or 16,000,000 multiplied by 1,000,000,000, which multiplied out, gives us the number 16,000,000,000,000,000, or more accurately or definitely
7068 expressed, 1.6^{16}. We have therefore, as the number of bacteria
following the assumption of the question, which must have been thrown into the canal, 1.6^{16}, as given. As the number of cubic centimeters into which this number was thrown was given as 1.6^{12}, the quotient of one of these by the other, gives the concentration of ten at the fourth power, or ten thousand bacteria to the cubic centimeter, on the assumption that the mixing or dumping took place through a period of four hours. We have therefore as concentration, 10,000 to the cubic centimeter. Now supposing this wedge of water to pass down the river absolutely unchanged, and supposing further that no increase or decrease in this number of bacteria should follow by death or by any other means, it is simply a statement of fact to say that we should find 10,000 per cubic centimeter at some corresponding time, in some part of the river below, but admitting the fact that a change by dilution follows by taking up the water of the tributaries, and through the uneven flow of the water, the particles moving more rapidly in the center than along the sides of the stream, a certain dilution must be calculated, must be admitted as taking place in this

volume. From the fact that these samples were all found within a 4-day period, or rather these bacteria were all found in samples collected in a period of four days, as presented in the question, I have calculated this original volume of water as
7069 diluted with the volume of water which flows at the mouth of the river in a period of four days. On that assumption, a number of at least 200 should be found per cubic centimeter, for each cubic centimeter examined, on the assumption that no death or loss of these bacteria takes place anywhere in the course. As a matter of fact not 200 were found in one cubic centimeter, but a very large number of examinations had to be made to find a cubic centimeter in which there was one contained. It is evident that an enormous destruction of these organisms must take place between the point at which the bacteria were thrown in, and the mouth of the river where the examinations were made. The actual finding is not over one ten-thousandth of what should be expected from 107 barrels on the assumption that these organisms did not die out; that is, we find less than one ten-thousandth of the expected amount. If we consider a number less than 107 barrels as added, one barrel for example, the probability of any organism of this character reaching the mouth of the Illinois river is less than one chance in 1,000,000. If we consider one barrel, or one one-hundredth of a barrel as added, the chance of one of these organisms reaching the mouth of the river and being found in a cubic centimeter becomes correspondingly reduced. Therefore, without involving any question of bacteriology, but simply a question of calculation, it is evident that the probabilities of any number of bacteria
7070 in a given small volume, reaching the mouth of the Illinois river, is extremely remote and not one which can be practically or seriously considered.

MR. JEFFRIES: I move to strike out the answer of the witness because the witness says that it is altogether a mathematical calculation and if so, it is incompetent, and for the further reason that the witness says that there is a continual change in the volume of the water and in the water with which the prodigiosus would be mixed on its journey from the canal to Grafton, and that such changes are brought about by the rapidity of the current, the general conditions of the river with reference to low and high water and ordinary stages, without the witness having qualified as a hydraulic engineer, or without having sufficient information upon that subject to give the correct amount of dilution that will be thus brought about during the journey of the prodigiosus from the canal to Grafton, and that the volume indicating the dilution is not contained in the hypothetical question upon which the answer is based.

ADJOURNED until 2:30 P. M. same day.

7071 2:00 P. M., Tuesday, September 29, 1903. Parties met pursuant to adjournment. Present, the Commissioner and same counsel representing the respective parties.

PROF. JOHN H. LONG,

resumed the stand for further direct-examination by Mr. Todd, and testified as follows:

Q. Professor, assuming all the facts to be true in the foregoing hypothetical question which was first presented to you and assume that the longevity of a typhoid bacillus is measured by the longevity of a bacillus prodigiosus, what is your opinion as to the probability of a typhoid bacillus entering the drainage canal at Chicago, from the sewers of Chicago, surviving the journey down the Illinois river and Mississippi river to the intake tower at the chain of rocks at St. Louis, based upon all the facts contained in the foregoing hypothetical question?

A. Measuring the longevity of the typhoid bacillus by that of the bacillus prodigiosus, from the fact as stated in the question that in the large number of examinations made at Lockport and Joliet and Peoria, no prodigiosus bacteria were found at all, and from the further fact that at the mouth of the river and at the intake tower at the chain of rocks, and in the water 7072 supply of St. Louis, the small number mentioned were obtained, and none at all in a period before the fourth of December, and none after the 8th of December, the possibility is extremely remote, and it is practically improbable, that a typhoid bacillus with longevity and virility as measured by that of the bacillus prodigiosus, could ever survive the passage down the drainage canal and the Illinois river and enter the water supply of St. Louis.

MR. JEFFRIES: Now we move to strike out the answer for the reason that the witness is not a bacteriologist, or at least has not so qualified, and that without such knowledge or information on the part of the witness governing the bacterial changes and conditions which govern bacteria in water, controlled largely by changes in volume, in temperature and local conditions and local disturbances of the water, the witness cannot testify with any degree of accuracy, and whatever opinion he may have on the subject is ill-founded and can not be considered as legal or competent proof or evidence upon the issues in the case, and for the further reason that the essential facts covering the life history of typhoid fever bacilli and prodigiosus in running water and in stream, is not sufficiently set out and embodied in the hypothetical question propounded to the witness, and upon which the opinion of the witness is based.

7073

CROSS-EXAMINATION,

By Mr. Jeffries.

Q. Professor, you are a chemist by profession, are you?

A. That is my profession, yes.

Q. You have made a specialty, among other things, of sanitary chemistry, in the last twenty years, or more?

A. I have.

Q. You were connected, were you not, with investigations made of the character of the different waters, by the National Board of Health, in the early eighties?

A. I was not.

Q. Were you a member of the National Board of Health?

A. I was not, although I made some investigations which were contributed to their publication.

Q. What was the object of those investigations if you know?

A. The investigations which I made were on the question of impurities in the atmosphere; the measurement of organic matter in the air.

Q. Those were the investigations that you made?

A. Yes sir.

Q. Was your investigation confined solely to that character of investigation?

A. For the National Board of Health, or for their publication, yes.

7074 Q. Now so far as sanitary chemistry is concerned, what experience have you had outside of your connection with the State Board of Health of Illinois?

A. The greater part of the work I have done in the way of sanitary chemistry has been done in connection with the State Board of Health of Illinois, and with the department of health of the city of Chicago.

Q. Confined practically to those two propositions?

A. Yes?

Q. Have you given attention to physiological chemistry?

A. I have.

Q. To what extent?

A. Part of my duty is the teaching of physiological chemistry to the classes of the medical school of Northwestern University. I have given such instructions over twenty years, and during that time have carried out various investigations in the field of physiological chemistry.

Q. That is in connection with your school work?

A. In connection with my school work.

Q. You stated in your direct-examination professor, that you had made certain bacterial tests in connection with your study of the Illinois river?

A. Yes.

Q. That you have taken pains to distinguish from the bacterial tests proper?

7075 A. Yes.

Q. Now will you explain just how it was you make use of these bacterial tests in your regular practice in the sanitary analysis of water?

A. In my examination of water I have made no attempt whatever to go into the question of the identification of bacteria. That is a field calling for the work of a specialist in bacteriology, but inasmuch as certain changes or reactions of a purely chemical nature are brought about by bacteria, I have given some attention to the conditions of such reactions. Those are properly of a chemical rather than of a bacterial nature. Certain bacteria have the power of producing certain decompositions, which can also be produced by chemical means. For example, the decomposition of protein matters by bacteria are analagous in many cases to those by chemical reagents, and in such examinations as I have made I have confined my attention to these reactions in using what are sometimes called bacterial methods in water analysis.

Q. You say sometimes that you use it. Why is it, professor, that you don't always use it?

A. Well that is a question I couldn't answer off-hand. To begin with, I might answer this; that years ago I did not realize the importance of making such tests. These tests in general have been made only within comparatively recent years, 7076 and in the first examinations I made the advisability of including these bacterio-chemical reactions did not occur to me, but in all recent examinations I include these bacterio-chemical tests with the others.

Q. Is there any well defined and regular line of distinguishment between the chemical-bacterial tests and those that are purely bacterial?

A. No, it is fair to say that there is not any sharply marked line. Chemists make both tests. Make the tests called bacterio-chemical and the bacteriological. The border line is not very sharp between them.

Q. Then, practically speaking, you have made bacterial experiments or examinations?

A. I have made experiments in which the action of bacteria are concerned, but I consider them as chemical experiments; not bacterial.

Q. Which do you consider the more important, the chemical or the bacterial tests?

A. That I cannot say. I consider both tests of importance in such work, but it would be impossible to state which has the greater value. In some cases one might have, in other cases the other. In the present consideration it would be impossible to say to which line of investigation the greater weight should always be attached.

7077 Q. Then both should always be considered?

A. I think both lines of investigation should be considered, yes.

Q. Now your interpretation of these results to which you have testified, and the tables which you introduced and read into the record were altogether chemical, were they not?

A. No, I have in some cases—I cannot exactly specify which ones now,—in some cases I have drawn from the bacterial examinations also.

Q. You made no mention of that fact in the testimony at the time?

A. Yes, I have mentioned that fact several times, but I cannot turn back now,—or I cannot recall now just which instances.

Q. Were the bacterio-chemical tests that you made sufficient to draw conclusions based upon a bacterial knowledge of water?

A. That question is not put exactly in a clear way, so I can not answer it.

Q. Well, without reference to the chemical analyses?

A. In some cases that I now recall, the evidence of the bacterial examinations is sufficiently definite to lead to a definite conclusion without appeal to the results of the chemical analyses.

7078 Q. Now you say you recall certain instances?

A. Yes sir.

Q. Now will you state some of those instances?

A. For example, in comparison of the Missouri with the Illinois river in 1901, where the bacterial evidence is very strong that the Missouri river is a more contaminated stream than the Illinois.

Q. What do you mean by the bacterial evidence?

A. I mean the bacterio-chemical evidence as it appears from the purely chemical reactions, brought about by the microorganisms, the production of indol and the liberation of acid and the coagulation of milk.

Q. Now, can you determine from a chemical bacterial examination which you have just referred to, whether or not the pollution spoken of is sewage pollution or from other sources?

A. I cannot.

Q. Chemical bacterial tests then do not show the character of the pollution?

A. The chemical bacterial tests,—no, in a majority of cases not.

Q. Well, now, can you tell from your examination whether or not the bacteria which you discovered are harmless or not?

A. I cannot.

7079 Q. Now, is there a difference between the bacteria that are harmless, and that that are not?

A. I could answer that question only in general terms. That involves a consideration of the bacterial phenomena outside of my province, which I cannot go into.

Q. Then you are not a bacteriologist at all?

A. I am not a bacteriologist at all, and I can answer no questions involving expert bacteriological knowledge.

Q. Then from your chemical-bacterial analyses of the waters, how can you tell that the pollution is of such character as to make the water unhealthy or not potable?

A. That I have not stated,—that it is unhealthful at all, at any place.

Q. Well, how can you judge as to the character of the water from a sanitary standpoint, not being able to tell from the chemical-bacterial tests,—the character of the pollution?

A. The character of the pollution—that can be answered in a very simple manner. I do not consider any river water receiving organic matter or drainage of farms or towns, as at all suitable for drinking purposes directly. That is a general answer to that.

Q. So your testimony in chief upon the sanitary condition of the water was not altogether based upon the chemical and chemical-bacterial tests that you made of that water, but also in connection with your general opinion upon the sanitary condition of river water? 7080

A. In general, yes.

Q. What is the source, Professor, of the most objectionable contamination of river water?

A. Well, that is a complex question very difficult to answer in brief terms. The answer to that question would involve a theory as to the origin of diseases. I am not attempting to testify at all as to the origin of infectious diseases, and therefore cannot attempt to tell what is the most objectionable contamination in water. It calls for a kind of knowledge outside of my special province.

Q. Are you familiar with what is regarded generally by sanitarians as the most objectionable?

A. I am familiar with what is generally stated by sanitarians as the most objectionable addition to be made to river water.

Q. Now, do you concur in their opinion?

A. Yes, in a general way.

Q. Now, what is it?

A. That certain products of human excretion are the most objectionable substances in water for consumption, or certain products of animal excreta.

Q. What particular products of animal excreta are the most objectionable?

A. Well, that is not the question, I believe,—what par-
7081 ticular products are considered by sanitarians. I am tes-
tifying to what I know of the belief of others.

Q. You stated that you concurred in their opinion in a general way?

A. I did, in a general way, but I wish to state here, explicitly, that I am not giving an opinion as an etiologist or bacteriologist. I could say this, that from my education as a scientific man I may concur in general with their opinions without passing an opinion of my own on that subject.

Q. You consider the opinion of scientists upon this subject to comprise the field of both chemistry and bacteriology and epidemiology as being worthy of confidence and respect, do you not?

A. Yes, I think some scientists agree on the origin of diseases, and on such points in which they agree I should concur naturally with the belief held in general.

Q. Then the extent and scope of your scientific work has not been sufficient to enable you to state upon your own information and experience exactly what product of excreta is the most damaging?

A. No, sir, I would not pretend to state that from my own experience.

7082 Q. Then, not being able to state what product of excreta
is the most harmful, you are not able to—from your
training and knowledge as a scientist, to determine what source of pollution is the most harmful?

A. Yes, in general I am able to make such determination.

Q. Then how is that determination made and what is the most harmful source of pollution in water?

A. To answer the first part of the question, the determination is made by the general methods already outlined. The methods of chemical and bacterio-chemical analyses. The most harmful source of pollution is that coming from animal excreta.

Q. How do you measure that?

A. That is measured by the character of the refuse or matter thrown off in this excretion. It is measured by the large number of micro-organisms which may be detected by the chemical-bacterial tests, which I have described, and by the relatively large amounts of certain nitrogenous constituents recognized in the chemical tests.

Q. Now, from these chemical-bacterial tests how can you determine the origin of the bacteria?

A. There is no way of always determining sharply the origin of all the bacteria but where enormously great numbers are found in sewage products, from the known facts re-
7083 garding the production of these substances, the conclusion
is in general warranted as to where they come from.

Q. Then your opinion as to the origin is based practically upon your fore-knowledge of the source of the pollution rather than upon the chemical bacterial tests themselves?

A. That fore-knowledge or general fore-knowledge has to be taken into consideration in reaching a conclusion.

Q. Now, in making bacterio-chemical tests of water composed partly from that flowing from a swamp and partly from the sewage of some city, how would you determine the origin?

A. In most cases it would not be possible to determine the origin. After water flowing from a city or from the sewage of a city, has become considerably diluted, it would be practically impossible to sharply deterimne the exact origin.

Q. Are there any cases in which it can be determined?

A. Only sharply in the case of very strong, fresh solutions of either the sewage or the vegetable products, found from the decayed or vegetable matter.

Q. Is that usually by the bacterial tests or the chemical tests?

A. It is shown by both tests to some extent.

Q. Now, can you determine from the chemical-bacterial tests which is which?

A. Yes. The chemical-bacterial test would show in the
7084 gas or fermentation test a very large amount of carbohydrate decomposition, and would indicate a larger amount of the production of indol for the sewage, than for the extracts of purely vegetable origin.

Q. Now, that shows a general polluted condition, but does not show the specific character of pollution?

A. No, it does not disclose the exact specific character of the pollution.

Q. How, then, do you get the specific character of the pollution?

A. In the case of the vegetable extracts, from the known fact regarding the substances produced in the decay of vegetation, and from the reactions for oxygen consumption, and free and albuminoid ammonia, we can pretty safely infer the origin of such fresh extracts—vegetable extracts containing pre-eminently more bodies of the carbo-hydrate groups and the derivatives of carbo-hydrates in comparison with the extracts of animal origin. These extracts give rather marked re-actions with the permanganate solution and at the same time not very marked re-actions with the re-agents measuring the nitrogenous matters. So there is that peculiarity in the examination of the fresh substances which is of value in distinguishing between them, which does not appear to the same extent in the examination of the older substances.

7085 Q. Now, that is derived from the chemical test, and not from the chemical bacterial test?

A. Yes, that is concluded from chemical tests.

Q. Confining the answers to the chemical-bacterial tests?

A. In the chemical-bacterial tests, the extractive substances from vegetation being of this peculiar nature in the main, there is practically little for the bacteria of putrefaction to feed on and therefore these factors measured by putrefactive changes are less marked in the case of the vegetable extract than in the case of the animal extract.

Q. Now, assuming, Professor, that the water in the stream comes from a sewage polluted district, and also from a district not a swamp, but of a swampy character, how would you detect the source of pollution and differentiate the pollution so far as the source of pollution is concerned?

A. Well, it is not always possible to differentiate sharply in a case of that kind unless considerable is known of the character of the soil through which the swamp or swamp-like water flows. In general waters of that character show very much less chlorine than do waters affected or contaminated by sewage, and we are very often able, although not always sharply, to draw from a determination of the chlorine a conclusion as to
7086 the possible source of the water. In general, in these swamp waters or waters which have taken up the extracts of decaying vegetation, as I said a little while ago, there are products characteristic of carbo-hydrate rather than protein decomposition and the detection of these, or the measurement of these gives frequently a clew to the origin of the water. The carbo-hydrates themselves, the pentose bodies particularly, which make up a considerable part of the vegetable extracts of swamps and various acid substances which are also extracted, yield no nitrogen at all, therefore, in responding to the nitrogen tests, but they at the same time, absorb a very large amount of oxygen from permanganate or similar solutions; we have therefore that clew to the origin of the water which sometimes would lead to a correct conclusion, but I cannot say that it always does. It is not always possible to differentiate between two waters.

Q. Now, what other information do you use in chemical-bacterial tests to assist you in determining the source of pollution?

A. Well, the amount of nitrogen in different forms is usually, or should be determined. The nitrogen in nitrites, for example, seems to be more characteristic, and to be formed in larger amounts from the breaking down of the products of the animal rather than of a vegetable origin, for the simple reason as I have said, that the products of vegetable origin con-
7087 tain more characteristically carbo-hydrates and the acid products derived from carbo-hydrates, rather than proteins, and therefore in general there is less of the oxidation products of the proteins, finally formed in the vegetable extract.

Q. Is there any other element?

A. Well, these are the most important elements,—the ones usually considered.

Q. Well, now, what other information is necessary or desirable besides the chemical or bacterial elements,—the two combined, or together?

A. It is always desirable of course in drawing a conclusion from such examinations, chemically and bacteriologically, to have as much knowledge as possible of all the conditions that obtain in any stream in question,—all possible factors should be taken into consideration in reaching a conclusion.

Q. Now, what are the most important conditions of that stream?

A. Well, the character of the watershed—what is called the watershed, the tributaries in the watershed, the character of the water in these tributries, the abundance of salt deposits for example, as contributing to the main stream or the tributaries, and many factors of this kind which it is always desirable to have in reaching a final and fair conclusion.

7088 Q. Now, can a fair conclusion be reached without that information?

A. I think it would be unsafe in most cases to draw very sharp conclusions without more or less of this information.

Q. Specify, Professor, in detail the desired information for instance, that which is upon the watershed in question. Now, what do you mean by that? Specify in detail what is meant?

A. I mean the towns on the watershed, and the contribution of sewers in general from those towns; whether there are great industries and of what kinds, on the watershed, and the rate or character of the flow from the watershed. These I think, as it appears to me, are the most important points that should be known.

Q. Are they essential points to be considered?

A. I think these are all important in a way, yes, essential before drawing a full conclusion.

Q. What particular importance do you attribute to the number of people or the population living upon the watershed of the stream of water that is being examined or under consideration?

A. Well, on the assumption that this population drains into the stream we have a means of accounting for and estimating perhaps roughly, any large amount of organic matter which may be observed in the stream.

7089 Q. What do you mean by organic matter?

A. Well, I mean substances characterized by chemists as organic compounds, or compounds of carbon with oxygen and hydrogen and nitrogen in certain complex composition.

Q. Whether it be excreta or what not?

A. Whether it be excreta or products of industrial waste.

Q. What consideration would be given in these determinations, the fact that a large portion of the people upon the watershed reside in a city sewered into the stream and those living upon the watershed on farms and in towns having no sewers. In other words, distinguish the difference in the consideration that would be given those respective classes of people?

A. Well, that is a simple proposition. The population residing away from the stream or not sewering into the stream would have of course, comparatively little effect in contributing anything to that stream, while those sewered directly into the stream would have naturally very much more effect.

Q. Now, do you give consideration to those facts in expressing your opinion upon the pollution of streams

A. In any opinion that I have expressed here today, I have given attention of course, to that fact.

Q. Professor, state in as simple a way as possible so that 7090 an intelligent layman can understand just what you mean by organic pollution?

A. In broad terms, we can consider two kinds of pollution,—organic and inorganic contamination. The inorganic contamination or pollution, if it may be called such, being made up of what chemists call the inorganic or mineral salts which are the combination of the so-called metallic elements, sodium, potassium, calcium and magnesium mainly, and ammonium also, with the inorganic groups and elements described as chlorine and sulphuric acid, nitric acid, phosphoric acid, and carbonic acid in general, while the substances spoken of as organic or described by chemists as organic are combinations, usually complex, of carbon and hydrogen and oxygen or carbon, hydrogen oxygen and nitrogen, and occasionally carbon, hydrogen oxygen and nitrogen, with small amounts of sulphur or phosphorus,

these latter substances, these so called organic substances, being distinguished from the so-called inorganic substances, in general, by this fact, that they undergo generally decomposition relatively easier, and that by high heat, they all suffer destruction, while in general, the so-called mineral or inorganic substances are practically fixed, or unchanged, so far as any alteration in water takes place, and are not fundamentally altered by
7091 ordinary heat, the inorganic substances being distinguished from the organic substances by a very much greater degree of stability.

Q. State the source of nitrates, oxygen and nitrites in polluted waters?

A. Well, nitrates in polluted waters or in natural waters, come from the breaking down of more complex substances, containing nitrogen. All organic substances which contain nitrogen suffer very peculiar changes in soils and waters, whether they be natural substance or products of excretion. In some of the simpler cases these substances break down, yielding comparatively simpler organic bodies containing nitrogen. These in turn go further, yielding ammonia, for example, and also other substances, and by further stages of change which take place in waters with substances of either vegetable or animal origin, this ammonia undergoes oxidation through the agency of plant forms, bacteria in general, taking up oxygen, forming the inorganic substance known as nitrous acid, which, however, cannot exist in waters as a rule as such, but combined with mineral bodies, forming calcium nitrites, sodium nitrites, potassium nitrites. The nitrites in turn undergo oxidaton by takng up oxygen and form nitrates. The course of oxidation, however, does not always proceed in this way. There are times when the breaking up
7092 of the nitrogen compounds, goes so far as to leave free nitrogen, which goes back into the atmosphere instead of producing nitrites or nitrates, which remain in the water. This re-action seemingly depends on an excess of organic matter present when the substance yielding the nitrite or nitrate, which substance is generally ammonia, comes in contact with the organisms which bring about oxidation. This fact is of the very highest importance in determining the amount of nitrate which remains in the soil. For example, when a soil is treated with certain kinds of fertilizers which are highly ammoniacal, and

the fertilizers are added in the presence of a very great excess of organic matter, particularly carbo-hydrate, then the expected result does not follow in general, but the substance is decomposed and the nitrogen is lost in the air. That point is well established by agricultural investigations, and unquestionably this same thing takes place in streams, although it would be very difficult to show it other than by showing it in solutions. Nitrates and nitrites then are products of oxidation.

Q. Professor, have you been familiar with the sewerage system of Chicago since 1886?

A. Yes. I have been reasonably familiar with that system.

Q. Now, will you state the leading features of that system during the period since 1886? 7093

A. The leading features of the sewerage system of Chicago are these: Chicago is, roughly divided, or for all practical purposes, divided into three sections known as the North, West and South sides. Practically the whole of the west side, certainly everything which was regarded as the west side as far back as 1886, was sewered, where sewered at all—and most of it was—into the Chicago river, and that is the condition which remained and remains down to the present time so far as the West Side is concerned.

In the North side, many of the sewers then were led into the river, and a certain number also into the lake, which number, however, has been gradually decreased up to the present time, so that only a portion north of Fullerton avenue is led into the lake, and the others into the river.

On the south side, while to begin with, most of the sewers were led into the river, a certain number flowing from State street to the east, were led into the lake, but these down to 31st street and south, have been gradually retired. At the present time and for a couple of years, most of the South Side sewers have been led directly or indirectly into the river. South of 31st street, however, there is still the area bounded practically by State street, and further south by Wentworth avenue, where the sewers are led directly or indirectly into the lake. All west of that still into the river directly or indirectly. By indirectly I mean this: In most of the cases the sewers are all low level sewers, passing directly into the river, but some of the larger ones are pumped. For instance, the large 7094 sewer which is known as the Halsted Street sewer, which drains a considerable territory, is pumped in one part of its course, and it reaches the river indirectly.

Q. It is pumped into the river?

A. It is pumped into another sewer which flows into the river.

Q. Now, that is on the south side of the city?

A. Yes. On the west side, it goes into the river,—a large part of the North side and a good part of the south side. I have had, from my study of this question, the exact figures on that, but I think I have given the case near enough for practical purposes.

Q. Professor, explain the difference in the sewerage system of the Sanitary District of Chicago and that of the city of Chicago?

A. There is practically no difference, because practically the whole of Chicago is in the Sanitary District, the part outside having a very small population,—an extremely small population.

7095 Q. What population and what part?

A. Well, south of 73rd street, near the lake, there is a part of the city not included in the sanitary district, but the population is very small and farther south of this, I think it is to 88th street, there is a district, the population of which is in the city, and that is likewise very small. On the west side I believe practically everything is included in the sanitary district. So as far as any practical consideration is concerned, the sanitary district includes the sewerage of Chicago

Q. What is the population of the sanitary district as compared with the population of the city of Chicago?

A. That I cannot give you exactly, but there is not a very great amount.

Q. Several hundred thousand?

A. No, it could not be as much as that.

Q. As much as 100,000?

A. No, I would say not.

Q. Do you know anything about the Calumet District, Professor?

A. Yes, I am quite familiar with the Calumet District.

Q. How large is that and what is the population?

A. Well, the boundaries of the Calumet District are very
poorly defined; the Calumet District, however, in general, is a
territory south of Chicago proper, and drained by what is
7096 known as the Calumet river, a small and rather sluggish
stream which flows into Lake Michigan near South Chicago. That river drains in addition to a portion of Chicago a very considerable area in northern Indiana and Illinois, a farm area, swampy in character.

Q. The Calumet river empties into the lake?

A. Finally into the lake. Yes, there are several branches included in the Calumet.

Q. Is the Calumet district included in the Sanitary District?

A. At the present time it is not. That is, what is commonly recognized as the Sanitary District, but it is expetced that it will be included through recent action of the Legislature.

Q. It had been authorized by the Legislature?

A. I understand so, yes.

Q. Now, what additional population will that bring into the district?

A. Well, the additional population that this would bring into the district, including the whole region south of 31st street, I cannot give you distinctive figures, but if the whole territory, including this Calumet region were brought into the district it would add about 250,000 to the present population draining into the canal.

7097 Q. Is that district growing rapidly?

A. It is growing rapidly in a manufacturing way, but not as regards increase of population.

Q. Where do the people live now that work in the factories there?

A. The people live—many of them in parts of Chicago,—go down there by street cars. Some live in towns in that region, in Pullman, for example, in Kensington, West Pullman, South Chicago, and some across the line in Indiana, in Hammond.

Q. Now, are there any other contemplated annexations to the district?

A. Well, this of course I can testify to only from general information. It is expected to include sooner or later the district north of Chicago, so-called Evanston, or the North Shore district.

Q. Now, what is the population of that district?

A. Oh, I cannot give you that; I haven't that.

Q. That is outside of the limits of the city of Chicago?

A. That is outside the Chicago limits at the present time.

Q. State if you know, Professor, what portion of the population of the Chicago Sanitary District now drains into the lake and what portion into the Chicago river?

7098 A. Well, at the present time about one-fourth or perhaps
a little less than one-fourth of the population drains into the lake, and the rest into the river—three-fourths or a little above three-fourths, into the river.

Q. What is the population of the district now?

A. That I am unable to say exactly. The population is not far from 2,000,000,—somewhere in the neighborhood of 1,600,000 people drain into the river.

Q. Do you know how much of the sewered population drains into the branches of the river, and what portion into the river proper?

A. It is not possible to answer that question exactly. I have stated that about 1,600,000 of the population drain into the river. When I use the term river, I include the so-called north and south branches of the river,—the larger part of this draining into the several branches of the south fork of the river.

Q. Professor, how long a time is ordinarily taken by the sewage of Chicago to flow through the pipes from its source to the point of discharge into the Chicago river?

A. I have no data at hand from which I could answer that question. In general this statement can be made as a fair one, that because of the flat character of the city of Chicago, the time consumed in the flow of sewage through the sewers is
7099 comparatively large, as compared with the time in most
of our American cities; the sewage remains a comparatively long time in these sewers.

Q. Now, Professor, you stated in your testimony in chief that you had made frequent examinations and inspections of the Chicago river in 1886 to 1891?

A. Yes.

Q. Please state what the general conditions have been at the times of your examination, and especially with reference to the changes which have occurred in the river during that time?

A. In general the condition of the Chicago river in this period from 1886 to 1891, has been bad. It has been foul, and there have been perhaps two general kinds of changes taking place here. There has been an increasing amount in general, of sewage going into the river, and an increasing amount from the population, and an increasing amount probably from the stock yards. In my testimony I explained that while there has been an increase in general in the number of cattle slaughtered at the stock yards, and consequently in the amount of filth produced, there has been at the same time an increasing effort made to retain this filth in the stock yards because of its commercial value, so that it is impossible to say whether much more 7100 or much less has found its way into the river. But this in general may be stated as now true, that whereas in the former conditions, rather large amounts of insoluble substances, or floating substances found their way into the river, at the present time practically only that escapes which cannot be precipitated or separated by pressure, or by retarding the flow by means of weirs or dams in the sewers. In general, those extractive matters only which are not easily retained are now allowed to escape from the stock yards. Practically all of the fats and insoluble proteids are retained because of their commercial value for fertilizers or other purposes. It would be difficult to say at the present time whether there is more or less actual matter coming from the stock yards than was the case some years ago.

Q. What, Professor, was the condition of the current or flow of the river during that period—the Chicago river I have reference to.

A. The flow of the Chicago river was somewhat uncertain. Still, in general, it was to the west and south. That is this was maintained by means of the pumps at Bridgeport. In flood time, at the time of heavy rains, the flow was very often reversed, and went toward the lake. Sometimes the condition appeared practically stationary, no current could be observed. At other times it was perceptibly more to the south; and at still other times, to the lake.

7101 Q. That reversal in the current occurred at intervals, did it not?

A. That occurred at intervals of heavy rains. Of course in the main the flow was through the canal. It was south and west. At times of heavy storm for a day or so perhaps, 24 to 48 hours at a time, the current might be in the opposite direction.

Q. That has not occurred since 1900?

A. No. Subsequent to 1900, the flow has been to the west and south, and not out into the lake.

Q. Now, how was it from 1891 up to 1900?

A. At several periods of short duration each, the flow was out toward the lake. In the rainy season of 1892, for example, there were a number of days where the flow was toward the lake.

Q. How far did the water from the river extend into the lake during these periods of reversal?

A. That I cannot say. It is impossible to estimate for this reason: those periods were periods of storm, and while the river carried dirty water into the lake, and while it might be supposed that from the extent of this dark colored water, the distance to which the river extended could be determined, that is not the case. The storms which produced the high water in general had the effect of stirring up the sediments in the bottom
7102 of the lake, producing a degree of turbidity which masked the effects of the river, so the limits could not be determined with any accuracy.

Q. Did you ever make any analyses of the water at the mouth of the river and in the lake, after these reversals?

A. At the mouth of the river?

Q. At the mouth of the river?

A. No, not directly at the mouth of the river.

Q. Or elsewhere?

A. I have made some analyses in the lake, that is, of water taken from the lake, and from some of the hydrants, at this time.

Q. How near the mouth of the river were those samples taken from the lake?

A. I cannot state that fact, of the distance exactly now, but to the best of my recollection, about a mile from the mouth of the river, and up and down the shore.

Q. Now, Professor, during this period from 1886 down to

January, 1900, you would call the Chicago river a very foul and contaminated water, would you not?

A. Yes, sir, Chicago river would be considered a very foul water.

Q. Now, that is true of the south branch of the river yet, is it not?

7103 A. Not exactly, it depends upon what you understand by the south branch. Will you explain to me what you mean by the South Branch?

Q. Well, south of Bridgeport?

A. You mean, probably, what we speak of there as the south fork of the south branch.

Q. Yes, the south fork?

A. Yes, at the present time the south fork of the south branch is rather foul.

Q. Very foul?

A. It is a pretty foul stream, yes.

Q. Now, how about the north fork?

A. The north fork is in general in very much better condition than the south fork of the south branch.

Q. Professor, do you know the population from which the sewage drained into the lake in 1886?

A. No, I cannot give you that.

Q. Can you give the population that drained into the river during that period?

A. I can only say in general that the larger part by far, of the population drained into the river, but I have no data from which I can give you the proportion of those draining into the lake and into the river at that period.

Q. How often did you conduct a series of examinations 7104 of the water of Lake Michigan, from 1886, down through the next succeeding seventeen years, or sixteen years?

A. From 1886 down my examinations were not as numerous as they were before 1886. The longest series of examinations I made was beginning with 1885, but I made occasional examinations down to about 1900, and since then I have made, during the progress of this investigation, some more.

Q. Are those results published anywhere?

A. Those results were all published, that is, by far the greater number of the recent ones in the reports of the Illinois State Board of Health already considered here.

Q. From your chemical analyses of the water of Lake Michigan during this period, what was the nature and character and source of the pollution of the water of the lake that you examined?

A. Well, from my various examinations I should conclude that the substances going into the lake came from the Chicago river, or the sewers leading directly into the lake.

Q. Did you conclude that any of it came from the Chicago river itself?

A. Yes, at the time of flood water which I have spoken of.

Q. How was that proportion shown in the analyses?

A. It was shown more especially by the increase of the
7105 amount of chlorine, and also by free ammonia and by
albuminoid ammonia, but not to any very marked degree by the oxygen consumption test. The chlorine is perhaps the best indication of additional substances from the sewers.

Q. What increase in those constituents did you find over and above those that are naturally present in lake water?

A. The chlorine has been slightly increased to the extent of about one-half a part per million, since the beginning of my investigations, one-half a part per million. The free ammonia is occasionally increased. At times, free ammonia has not been measurable by our ordinary tests, as we make them; expressed in the usual way, as .00; that is, using two places of decimals. At times when there is low recordable free ammonia, and it has been found since those earlier years, up to .05 and even more, but it has not always been certain that this increase has come from the lake proper. The evidence was that it very frequently came from nearer shore, or from the city itself.

Q. At what points or places in the lake did these evidences of pollution exist?

A. The waters taken at the Lake View tunnel, Chicago Avenue tunnel, the Four Mile tunnel and from the Hyde Park
tunnel, that is, from the four main supplies of the city
7106 have shown a slight increase in these factors. At times
there has been apparently a very considerable increase in these factors, and false conclusions have been drawn from obser-

vations made at those times. It is now well known that there have been several periods when the water was assumed to come through the tunnels when it was pumped from very near the shore. For example, in 1892, when very erroneous and widespread conclusions were published regarding the source of typhoid fever in Chicago, when it was assumed that the waters were all drawn from the long tunnels, it is now well known that a large part of the water used on the North side was pumped from a so-called emergency tunnel, extending out four or five hundred feet in the lake and ending within the break-water. The engineers, anxious to make a record of economy in use of coal, drew from the short tunnel, delivering a very contaminated supply, and the epidemiologists, seeing the results of this contamination, concluded that the supply from several miles out was badly polluted.

At a much later period, which has likewise been very generally discussed, it is known that water has been drawn from sewers in Chicago at frequent intervals. In the matter of discussion, why, the mortality for certain diseases should be apparently greater in a part of the city which is furnished with the best water supply, this increased mortality having
7107 been apparent through a great many years, certain pronounced conclusions were drawn from observations to the detriment of the reputation of the water supplied from the long tunnels. It has since been discovered that owing to very faulty construction in the pumping station drawing water for one of our supplies, that at frequent intervals in the last thirteen or fourteen years water has been drawn not from the tunnel as supposed, but from the overflow of a sewer into a well in the waterworks, the sewer discharging as much as a volume of ten inches or twice ten inches into the pumping well for hours at a time.

I mention this fact because it is to illustrate that it is not always best to draw a definite conclusion from the result of analyses of the Chicago water which came through the taps. The location of the pumping station which I refer to was on the west side, drawing water from the so-called Four Mile tunnel—the Harrison Street station.

Q. How do you associate typhoid fever with polluted water?

A. I do not associate it. I am simply speaking of the association which others have made.

Q. So in your last answer you said simply what others say rather than what you say yourself?

7108 A. I state the conclusion which others have drawn from the apparent conditions.

Q. How far out into the lake do these different tunnels extend?

A. The most northerly one of these tunnels, the so-called Lake View tunnel, extends out about a mile, practically a mile. The so-called Carter Harrison crib supplies water through a tunnel about four miles in length. The oldest of the tunnels is the so-called Chicago Avenue tunnel, which is about two miles out. Opposite about Twelfth or Fourteenth street on the South Side another tunnel extends into the lake about four miles, and that crib is usually spoken of as the Four Mile Crib, while in the southern part of the city another tunnel commonly spoken of as the Hyde Park tunnel also extends out about two miles. I think I have stated for the Lake View tunnel a mile. It is over that. It is two miles. We have two tunnels extending out approximately four miles and two tunnels extending out practically two miles.

Q. What, from your analyses, is the chemical condition or the constituents of the water at the mouth of these tunnels?

A. You mean in the lake where they take the water?

Q. In the lake?

A. I have no large number of analyses made there. Some years ago, since 1890, I made some collections in the lake,
7109 two and four miles out, at about the location of some of these tunnels. At that time the water was very good at the tunnels themselves, that is, no pollution measured in the ordinary terms, could be recorded; no appreciable difference between the water there and the water taken six or eight miles out. I made certain determinations of that water, but since then I have made no collections out in the lake, so I have no data to answer your question further.

Q. The water at these points remained generally the same, or was there a change in the chemical constituents of the water?

A. The water at these points is subject to some changes on account of high winds, particularly. At the time of high wind the lake becomes extremely rough, and there is always more or less sediment washed into the water, stirred up in the water, even as far out as the intake of the two four mile tunnels. The water shows then some change in certain of the determinations.

Q. What effect does the stirring up of the sediments by the wind have upon the chemical analyses?

A. It has the effect of increasing the organic matter as measured by the oxygen consumption and the albuminoid ammonia, not very greatly, but there is an appreciable increase.

Q. How great?

7110 A. The albuminoid ammonia as measured quite far out in the lake is ordinarily about this: .07. It may increase at time of high wind to .09 or even .1. I am referring to the conditions through the long tunnels. The oxygen consumption as measured by the Kubel acid test is usually about one or below one part per million. It may increase to one and one-half parts per million in time of high wind.

Q. How about the nitrites in the river?

A. The nitrites and nitrates are practically always absent in Lake Michigan. Occasionally we find traces of each, but the traces are so extremely minute as to be beyond any accurate estimation.

Q. Now as to the character of the water?

A. As to its appearance, you mean?

Q. Its general appearance and its general character?

A. At time of high wind the water appears somewhat turbid, a very large amount of this turbidity, however, being certainly mineral origin, which I should explain. Owing to the building of parks east of the city in the last eight or ten years perhaps, I am not very sure of that time, but for a number of years back,—a very large amount of substance has been dumped there,—a very large amount of clay from the construction of a tunnel under the city has been dumped into
7111 the lake. At one time, and perhaps at the present time, in building one of the parks a large amount of street sweepings have been dumped into the lake, into the lake at a point largely enclosed by a breakwater, but not completely enclosed. A considerable part of this matter has gradually washed out along the bed of the lake. The tests which I mentioned

indicate the presence of this clay substance which I think is mainly responsible for the opalescent condition which is very frequently observed now.

Q. Was it formerly observed?

A. In former years not. In my earlier examinations of the water of Lake Michigan, the water was very clear most of the time.

Q. Not always, however?

A. No, not always. Occasionally it was somewhat turbid, but through the greater part of the time it was practically clear.

Q. Now how far are these tunnels from the mouth of the Chicago river with reference to the end of the tunnel located out in the lake?

A. The intake of the Chicago Avenue tunnel is the nearest to the mouth of the Chicago river, and is approximately, I
should say, two and a half miles from the mouth of the
7112 river. The entrance to the intake of the Four Mile tun-
nel is probably four and a half miles from the mouth of the river. The entrance of the Hyde Park intake is seven or eight miles from the mouth of the river, and the entrance of the Lake View tunnel intake is probably five miles from the mouth of the river. These are only estimates.

Q. What do you say as to the water at these four respective tunnels or intakes being potable water?

A. The water at the intakes at the entrance of these tunnels I consider in the main, generally potable.

Q. Do you consider it absolutely safe for drinking purposes at all times?

A. Well, it would be hardly fair to say that it should be so considered at all times.

Q. Now in making the statement as to the potability of the water, do you take into consideration only the results of your chemical analyses or do you combine these results with the experience of the people living in Chicago and using the water?

A. In reaching this conclusion I consider my own analyses. I depend to some extent also on the opinions of those who are making investigations in other lines, bacterial tests proper. They have some weight in influencing me.

Q. Now what is that opinion and results of scientists
7113 making examinations along other lines. State plainly
what that is that you take into consideration?

A. Well, as I said in my answer, I considered my own results there, but have been influenced to some extent by the opinions advanced by others, who are making what are called bacterial tests proper. I will say here that there is considerable disagreement among scientists as to the conclusions which should be drawn from those tests. I am not a bacteriologist and perhaps should not pass on the merits of their conclusions.

Q. Here is what I want to get into the record, is what are those conclusions of other scientists upon which you in part base your opinion, that is it?

A. Some of the scientific men who have made examinations in Chicago of the lake water, have considered from the results of their examinations, that the water is frequently bacterially contaminated, and therefore they object to its use.

Q. Now, do you take into consideration in passing judgment upon that water, its effect upon the people who use it?

MR. TODD: I want to interpose an objection to this line of cross-examination as it is not proper cross-examination of anything brought out in chief.

MR. JEFFRIES: I suggest that the quality of the water
of Lake Michigan was brought out on direct-examination
7114 and, if not, it is competent at any time for the purpose
of showing that the water discharged by the Sanitary District into the Desplaines river at Bear Trap Dam, is polluted water and not free of contamination.

Q. (Last question read).

A. I will have to answer that question this way. Inasmuch as it is practically impossible to determine the effect of the real lake Michigan water on the people who are using it, or supposed to be using it, I am inclined to depend very little on the stated effect. So little dependence do I place on the statements of the epidemiologists and etiologists that I use and have
used, without boiling, Lake Michigan water for twenty
7115 years.

Q. Did you ever have typhoid fever?

A. Never, sir, and don't expect to.

Q. Have any steps been taken by the Health Department of the city of Chicago or by the State Board of Health of the State of Illinois, to determine the effect of the water of Lake Michigan upon the people using it for domestic and drinking purposes, and have you ever been associated with any such steps or endeavors?

A. I cannot testify directly as to that. I am not connected with any such examination for the city or for the state.

Q. Well, have you ever been?

A. I have not.

Q. Well do you know of any such steps being taken?

A. I know that attempts have been made to connect the character of the water, with the appearance—

Q. Then you discredit the reliability of the effect of the water upon people who use it as being any indication whatever of the sanitary condition of the water?

A. No, that is not what I said. I discredit the assumed effect of the Michigan Lake water on the people of Chicago, since it has been determined that many of the conclusions have been drawn from, not lake water, but from the sewer water, water pumped almost directly from a sewer. The most weighty and unsound conclusions ever drawn were drawn from water collected in that way. 7116

ADJOURNED until 10:00 A. M., Wednesday, September 30th, 1903.

7117 10:00 A. M., Wednesday, September 30th, 1903. Continuation pursuant to adjournment. Present, the Commissioner and same counsel representing the respective parties.

PROF. JOHN H. LONG,

resumed the stand for further cross-examination by Mr. Jeffries and testified as follows:

Q. Professor, do you recognize the difference between a polluted water and an infected water?

A. Such a difference is made.

Q. Is it chemically made?

A. No.

Q. Well, in what way is it made?

A. The distinction usually made at the present time is that polluted water is one which may contain foreign substances,—substances foreign to the water, while infected water is one which contains or is assumed to contain the elements of disease, or the elements which produce infection or disease.

Q. Now then, state briefly, professor, the sources of pollution in water and the sources of infection in water?

7118 A. I have already stated the general sources of pollution in water. The addition to the water of trade wastes, household wastes, sewage, and practically everything which does not belong in a normal water. The sources of infection I can speak of only in a general way, as I am not an etiologist, a bacteriologist nor an epidemiologist. Infections are supposed by those who claim to have knowledge on that subject, to come from so-called pathogenic bacteria, about which I am not testifying.

Q. And that, as solely to the infection of the water?

A. Yes.

Q. Then what does infected water mean to you as a chemist?

A. As a chemist really, in the limited sense, infected water has no meaning to me.

Q. Now as a sanitarian, what effect has it?

A. As a sanitarian of course I should object to the use of the infected water.

Q. Now then, how do you differentiate the infection from a sanitary standpoint from that of the chemist,—how do you differentiate between the two?

A. Well, as a chemist I would not speak at all of infection.

Q. And you haven't considered that anywhere in your analyses?

A. I have been very careful not to go into a province which is outside of my line of inquiry.

7119 Q. So then, from your chemical analyses you have been unable to determine the presence of infected matter in the water?

A. That is true. I have not attempted to.

Q. That does not necessarily mean that the infection is not there?

A. Just make that a little bit plainer.

Q. Well, the fact that your chemical analyses did not disclose infected matter in tthe water, does not necessarily mean that no such infection is contained in the water that you have analyzed?

A. Certainly not.

Q. Professor, are all pollutions equally dangerous?

A. No, in general it would be safe to say not.

Q. Of what benefit then is the chemical analysis of the water which you have examined, and which is represented by the tables which you have introduced in evidence here, in deriving knowledge as to the sanitary condition—or information as to the sanitary condition of the water?

A. Well, this chemical knowledge, combined with the knowledge of the origin and sources of the waters, in question, permits a comparison to be made between the different waters as to the amount of their pollution. The work is of comparative value.

Q. And not infection?

7120 A. I have not gone into the question of infection at all, at any time.

Q. Then from the analyses that you have made, you cannot, as I understand you to say,—you cannot determine whether infection is in the water or not?

A. I cannot; I never attempted to.

Q. Then as a chemist any conclusions as to the sanitary condition of the water from the chemical analyses that were introduced by the tables here, would be unreliable, would it not, so far as infection is concerned?

A. That does not follow, because we must call upon our practical knowledge and practical experience regarding the sources of water, as we know that infection in the general sense of the term cannot and does not take place in water except by the addition of something else, which the chemist can recognize and does recognize. These tables then have some value in measuring the relative danger or the relative safety of water.

Q. Can the chemist tell whether or not the organic matter that is contained in the water is in part infected matter or not?

A. Not from his chemical analyses alone, no sir.

Q. Can he tell whether there is any infection?

7121 A. The chemist, from the chemical investigations alone, can not.

Q. Then the chemical analysis is beneficial to the sanitarian only to the extent of showing the amount of organic pollution, regardless of the character of that pollution, is it not?

A. Well yes, that is a practical statement of the question, although the chemical analyses as I explained yesterday, under certain conditions, certain circumstances, do give a clew to the kind of the pollution.

Q. What is there, professor, in albuminoid ammonia that has any specific injury or harm in it?

A. In albuminoid ammonia itself, of course, there is nothing which is injurious. What the chemist terms albuminoid ammonia is a product or is ammonia separated by decomposition in the laboratory process, of certain relatively complex substances, of which albumen is a type. That albumen is of course not the only substance which in the laboratory process yields this albuminoid ammonia, inasmuch as I explained fully yesterday, the substances which yield albuminoid ammonia are more largely animal than vegetable because in the animal products the protein or albumen substances predominate over the other. Then it follows from that, that the measurement of large amounts of albuminoid ammonia on the one hand and 7122 large oxygen consumption on the other, give in many cases a clew to the source of, or origin of this albuminoid ammonia. The substance itself is suggestive and in a small amount found of course it is harmless.

Q. Then albuminoid ammonia in water is not specifically injurious?

A. Albuminoid ammonia in water itself is not injurious.

Q. And how is it as to free ammonia?

A. Free ammonia in water is itself, not injurious, and the conclusion which one must draw from the presence of free ammonia, is to be made only after the analyst is in possession of knowledge, and often considerable knowledge, of the source of the water. I have found in artesian well waters, an amount of free ammonia,—about two or three parts per million, which would certainly condemn any lake or river or ordinary well water. This free ammonia is merely a step in the gradual breaking down of the original complex nitrogenous substances which enter the water from animal or vegetable source, and the measurement of the amount gives in many cases, an idea of the extent of this breaking down, or the amount of the substance which undergoes decomposition or breaking down.

Q. Professor, how much free ammonia is necessary to condemn water for domestic purposes?

A. An answer to that is practically contained in what I 7123 have just said that free ammonia in enormously large amounts will not condemn an artesian well water, but in very much smaller amounts it is suggestive of contamination. in shallow well waters. You can't give any hard and fast rule in conclusion of contamination of water from free ammonia.

Q. Then it is not a correct index under all conditions?

A. No one element taken alone should be considered as a correct index under all conditions.

Q. Now, professor, is the health of the community drinking a certain water an index to its potability?

A. Not absolutely. If we could assume that that was the case, we should also have to assume that the water consumption is the prime or only factor entering into the health of the community, leaving out of consideration the air and the soil and the temperature, and the winds, and so on, so the conclusion that can be drawn from the water is necessarily limited.

Q. Now there are certain diseases known as water-borne diseases, are there not?

A. I have heard of those.

Q. Do you recognize that to be the fact?

A. I am not discussing etiology.

Q. Well, as a sanitarian do you recognize that fact?

A. As a sanitarian I recognize that certain diseases are spoken of as water-borne diseases, yes.

7124 Q. Well, what do you say on the subject?

A. Well I say as I said yesterday, that many of the conclusions of sanitarians on this point have been based on such faulty observations that this is quite unsafe,—to draw any general or radical conclusions from them.

Q. Then I understand you to say that you do not agree to the proposition that there are certain diseases which are water-borne diseases, and known as such and recognized as such?

MR. TODD: I object to the question on the ground that the witness is not called upon to testify to what counsel understands him to say.

A. I would like to have the stenographer read over what I have said here lately. I think the counsel misunderstands my answer.

(Last questions and answers read.)

A. Now, while not saying or intending to testify at all as an etiologist, or as an epidemiologist, as a further illustration merely of what I have said, take the case of yellow fever, which all sanitarians for many years, have assumed to be a water-borne disease, but which is now by sanitarians traced to other causes. So I say that because of lack of more specific knowledge on these things, I would not like to be forced into the position of drawing a very sharp conclusion, and do not intend to.

7125 Q. Then in order to understand you correctly, do you put much stress and lay much importance to the proposition of sanitarians that certain diseases are transmitted by water, known as water-borne diseases?

A. I would answer again, that while a discussion of that subject is outside of my province and I must be distinctly understood as not wishing to pass an original opinion on that, I will admit this: that sanitarians do regard certain diseases as water-borne, and in some cases, where the weight of evidence seems to be very great, I am inclined to accept the opinion of sanitarians, without advancing an original opinion of my own on the subject.

Q. Then, professor, not being an epidemiologist or an etiologist, to what extent have you considered the information and opinions of others in connection with your own, in determining the sanitary condition of water in the Illinois river?

A. In determining the condition of the water in the Illinois river I depended almost solely on the information afforded by my own experience—my own examinations of a chemical nature, and what I spoke of as bacterial chemical experiments.

Q. Then you did not take into consideration infection?

A. I did not, as I have said repeatedly this morning.

Q. Did you take into consideration the infection in the
7126 Mississippi river when you gave an opinion upon that
water from your analyses?

A. I did not.

Q. In the Missouri?

A. I did not.

Q. Then, professor, in making the analyses and in expressing or drawing your conclusions therefrom, you have left out of consideration the question of infection, which is the most important, in fact, the only thing to be considered of importance in the analysis of water, for sanitary purposes, and for drinking purposes, have you not?

MR. TODD: I object to the question on the ground that counsel assumes infection as testified to by the witness, is the most important matter for consideration.

(Question read).

MR. TODD: I would like to ask counsel what meaning he attaches to the word "infection," for my own information.

MR. JEFFRIES: In answer to the suggestion of counsel or the request of counsel I refer him to Professor Long's definition of infection,—who is the witness now on the stand.

MR. TODD: I merely wanted to understand in what sense counsel used the term, and understanding that he uses
7127 the term according to the definition given by Professor Long, his explanation is entirely satisfactory.

Q. (Last question read).

A. In answer to the question I will say that in forming my conclusions, I have left out of consideration the question of infection, because it does not come within my province of discussion, but I cannot agree with the assumption of counsel in the question that that is the only point of importance to be considered here. I differ from that very decidedly and strongly.

Q. Is it not the most important?

A. For the purpose of the examination that I have made, it is not the most important at all.

Q. Is it not more important for the purpose of ascertaining whether or not the water is suitable and safe for drinking and domestic purposes?

A. The object of all of my investigations has been to determine the extent and rate of destruction of organic pollution in the waters in question and to compare these several waters with each other.

Q. Then it has not been with a view of determining whether or not the water is safe to drink?

A. In that sense—in that narrow sense, it has not been.
7128 I have declared that in my opinion that none of these
waters under consideration are safe to drink.

Q. Why not?

A. Because they receive a large amount of filth of all kinds from innumerable places, and whether there is any infection there or not, I object to the drinking of such waters.

Q. Does that include Lake Michigan?

A. It would include Lake Michigan in case it received an amount of filth at all comparable with the waters in question, which it does not.

Q. Well, how does the water of the Illinois river since the opening of the drainage canal, compare with the water of Lake Michigan, so far as the sewage discharges are concerned, speaking with reference to their being comparable?

A. Well, I still prefer Lake Michigan to the Illinois river as drinking water.

Q. Well is there any comparison whatever to be drawn between the lake and the river?

A. Not as a drinking water I think.

Q. On what do you base that opinion?

A. On the statement which I made a short time ago, that because of the very large amount of substances of all kinds entering the Illinois river, and because of the known fact that
a very much smaller amount of substances enters Lake
7129 Michigan, I prefer lake Michigan water to Illinois river
water.

Q. What amount of polluting substances would be necessary to make the water of Lake Michigan unfit for drinking purposes?

A. I am not doing any guessing on the witness stand. I don't know.

MR. TODD: You are not an epidemiologist?

A. I am not an epidemiologist, no.

Q. MR. JEFFRIES: Do you know what amount of polluting substances in any water would be necessary to make it un-drinkable?

A. It is not possible to assign a hard and fast rule in any such case, and I should not be drawn into any such discussion as that.

Q. Well, what amount in any particular water that you are acquainted with, would be necessary?

A. Well, if I should find five parts of albuminoid ammonia per million, in Lake Michigan, I should certainly be afraid to drink it.

Q. Have you found one part in Lake Michigan—one part per million?

A. No, I have never found one part per million of albuminoid ammonia in Lake Michigan.

Q. Did you ever find .1 of a part?

A. I am not going to follow in tenths, from one tenth
7130 up to ten-tenths, to tell or attempt to tell where the line
of demarkation would be between a bad water and a good
water in Lake Michigan.

Q. Why do you decline to tell, Professor?

A. Becaue it has no bearing on my testimony in any way. It is simply a question which if followed out consecutively would lead to an impossible answer. I have been there before on such questions.

Q. That is one reason, is it?

A. That is a good and sufficient reason for me at the present time. There may be others.

Q. Professor, if all organic pollution consisted of dead and not living matter, would the water containing any of it be specifically injurious?

A. Not at all times, but under many circumstances it would be.

Q. Why?

A. Well, that question requires an answer perhaps at some little length. A great many kinds of so-called dead organic matter are of such a nature that when taken into the human stomach they interfere with the natural and necessary and normal processes which go on. There are some of them acting as toxins or poisons, and thereby interfering with normal pro-
cesses; others because of a sense of disgust which they
7131 may arouse, so influencing the normal functions that they
will not take place in their usual manner. Dead organic

matters of these kinds, and products from dead organic matter may be in themselves then harmful and injurious from the reasons which I have just given.

Q. Would they kill people?

A. Yes, in sufficient amount they would undoubtedly kill people.

Q. Now, do your chemical methods enable you to differentiate between dead and living materials or dead or living organic matter in the water?

A. No, the chemical analyses certainly not, but the bacterial chemical tests which I have made, indicate the presence of the living organic matter as I have explained, on several occasions.

Q. Then it may contain both vegetable and animal?

A. It may.

Q. What is your opinion on the subject?

A. It does; most waters do.

Q. But you cannot detect it from the chemical analysis?

A. Chemical analysis would not; that is chemical analysis as ordinarily made would not. I would not like to give a perfectly sharp answer to that, because off-hand I do not want to attempt to limit the power of organic chemistry in detecting certain things. 7132

Q. You are speaking then of its possible future results?

A. No, I am speaking of possible present conditions, but I say I would not like to state sharply what chemistry could detect by the use of more refined processes than we have already applied in the sanitary examination of waters.

Q. Now, you are speaking of conditions that you have applied in this investigation?

A. Yes, of course. In what we call sanitary water analysis, no attempt is made by chemical means to differentiate between the living and the dead organic matters.

Q. And is there any chemical means by which they can be differentiated?

A. That is the point which I have just explained, when I said that I am not able to state definitely what the limits should be to the work of a skillful chemist in this field, using methods more refined than those which we ordinarily require in sanitary water analyses.

Q. Professor, why do people boil their water which they think is unsafe for drinking puposes?

A. Well, I can answer that from the general standpoint, they have been told that there are germs in it and they boil it.

7133 Q. And boil it?

A. Well, some of them do, and some of them do not; I do not.

Q. What is the object of scientists in recommending the boiling of water?

A. Well, scientists in recommending that think that by boiling it, they will destroy this assumed infection.

Q. Now, you say "assumed infection" do you mean that it is an infection assumed upon your part or assumed upon their part?

A. Assumed on the part of the so-called epidemiologists and others.

Q. As a chemist you know nothing about it?

A. As a chemist I know nothing about infection.

Q. Or the causation of diseases relating to drinking water?

A. Absolutely nothing as a chemist. I don't bother about that at all.

Q. So that when you testify or express an opinion upon the sanitary condition of water, aside from what your chemistry tells you, it is nothing more than the opinion of an ordinary citizen or layman?

A. Well, I think that is going a little too far . I believe the chemist by his chemical methods is still able to tell a
7134 great deal about water. I am very careful not to express an opinion, however, which is unwarranted by the extent of my investigations.

Q. Aside from your chemical tests, what aid as a scientist, do you get from the opinions and experience of epidemiologists and to what extent do you use it in expressing your opinion, if any?

A. In expressing my opinion I make practically no use of the assumed experience of epidemiologists.

Q. Professor, as a chemist, are you able to differentiate between organic matter that comes from human excreta, and that which comes from street washings, barnyards, cattle pens, and other places of like character?

A. No, as a chemist I should not attempt to make any such differentiation in the course of water analysis.

Q. And you have not so attempted in any of these investigations?

A. I have not, no.

Q. Now, Professor, I understood you to say that you, in making your chemical analyses and giving your opinion upon the sanitary condition of the water of the Illinois river, you disregarded the opinion of epidemiologists and those sanitary experts who recognize an association between the pollution
7135 in water and disease germs and diseases which are brought upon people who are in the habit of drinking the water?

A. In forming my conclusion, or in stating my conclusions, I will say that I have not attached much importance to the opinions of epidemiologists, but I have in the reports which have been published referred to the work of others who have made parallel investigations and who will testify when the time comes, whose investigations were made parallel with my own, and on the same waters in most instances.

Q. You have never investigated the relations of health and water here at Chicago or anywhere else, have you, Professor?

A. Not in a very extended way, but far enough to show that the assumptions made by certain epidemiologists who claim that they have made studies of the water supply of Chicago at several periods in the history of Chicago, but not founded on sufficient knowledge of the facts to merit the attention which the publications really attracted.

Q. Now, Professor, will you state the reason why you have thus concluded?

A. I stated yesterday in some detail, one of the main reasons for my lack of faith in the opinions advanced by these infant industry scientists called epidemiologists. It is well known that in drawing their conclusions these people have been
7136 so often ignorant of the most important facts in the case, that the conclusions are finally of no value. From my own studies, and investigations, and from my knowledge of things as a citizen of Chicago,—things which I have paid close

attention to for over twenty years, I am able to state positively that in several of the most noted of these cases where epidemiologists from abroad have passed on the condition of affairs in Chicago, they were certainly mistaken in their conclusions.

Q. Now, Professor, I would like you to state some of the *conclusions that were reached* by epidemiologists with reference to the water supply of Chicago, and the reason which you give,—a substantial reason,—a substantial fact which makes you disbelieve the correctness of their position?

MR. TODD: I want to interpose an objection to this line of cross-examination on the ground that it is not cross-examination of anything that is brought out in the examination in chief, and therefore it is not proper cross-examination of the witness.

MR. JEFFRIES: I suggest that the question of the quality of the water of Lake Michigan was brought out in direct examination and I suggest further that this witness has given an opinion as to the sanitary condition of the water of the Illinois river, and we have a right to ask him any question on cross-examination that would tend to disclose the source of his information or the extent of his knowledge upon the subject. 7137

MR. TODD: As a further objection, I wish to urge that counsel for defendants have no objection to the conduct of the examination upon the lines indicated in the last question, but we do object to interrogating the witness upon epidemiologists and their views and their conclusions, as being no part of the direct examination in this case, and brought out by the cross-examiner himself and was not gone into on direct testimony, and it is to that phase of the cross-examination that I interpose my objection.

Q. (Last question repeated)?

A. In answer to that question I am willing to repeat in substance the statement which I made yesterday, which I thought was sufficiently definite.

In two periods of the recent history of Chicago it has been assumed by epidemiologists that infection comes from certain of the tunnel waters brought into the city. It has been shown by investigation, which will be detailed here later, at the proper time, that before the World's Fair, at a time when a great deal was said about the infection of Lake Michigan water, a good

part of the supply in one section of the city was drawn,—not as was supposed,—from the Chicago Avenue tunnel, extending out about two miles, but from a short, or emergency
7138 inlet,—a short tunnel extending out to a distance of about
500 feet, to be used in case of emergencies,—in case of a large fire, for example. At that time the pumps which were at work in the pumping station at Chicago avenue, were generally in pretty poor condition. There was frequent complaint of the amount of water which they could pump. There was very frequent complaint of lack of sufficient head to carry the water above the first or second stories of the buildings. At that time, in order to lessen these complaints, it has been established by investigations as will be explained, that water was drawn by the engineer in a large quantity and through a very considerable period from the short inlet. This water was very dirty. It was drawn from a point where there was considerable contamination from dumpings, and washings, and sewers and so on. Therefore I say that the conclusion that the water from the two mile tunnel was the source of the disease which the epidemiologists described at that time, is not a fair conclusion.

At a later period, last year, through the spring and summer of last year, there was a remarkable epidemic of typhoid fever in Chicago. It was a very singular fact—a puzzling fact, that the greatest prevalence of this appeared to be in a part of the city which received what was supposedly the purest
7139 water drawn from the longer tunnel, and a great deal
was written and expressed in public addresses, in regard to the infection of the water at that great distance, shown from the appearance of the fever in this part of the city. It was later discovered, some time in June, I believe, that through some accident or oversight which occurred many years ago,—how many we cannot say definitely,—perhaps over ten or fourteen years—certainly at a period beyond the recollection of the men employed in the pumping station, a connection was left between a well in the pumping station and a sewer, so that at the time of high water, at the time of heavy rains, it was possible for one of the large sewers in that part of the city to flush over and throw a great volume of foul water through a ten inch pipe into this well, so that it could be drawn into the supply. That fact

is known to many people in the city and in the engineer's office. I state that here then as a further explanation of why I am not willing to accept the determinations of the etiologists and epidemiologists. I am referring principally to people in Chicago who made these complaints of last year, that the source of the infecion must be referred to Lake Michigan. It is evident that that was not the source of the pollution in the mains in that part of the city. Those are two, and I think, sufficient illustrations for all practical purposes.

7140 Q. The increase of typhoid fever following the use of the water from the sewer at the particular place mentioned, and of the water of the lake near the shore, a distance of 500 feet I believe, out, associates the typhoid fever rate with the water that was used by Chicago at the time, doesn't it?

A. It is so assumed by epidemiologists.

Q. What do you say on the subject? You made that statement a minute ago?

A. I made the statement a moment ago only from facts that were brought forward to suggest an explanation of this typhoid fever. I was disposed to doubt the accuracy of the conclsions in the first statements. I have made no original statements on the matter at all.

Q. Then the epidemiologists who passed judgment on the water were correct in that the typhoid came from the drinking water, still, it matters not where it may be taken from?

A. From the standpoint of modern etiology I believe that is true. As a chemist I wouldn't like to pass on the question.

Q. Have you any reason to doubt that was caused by the water?

A. No, I will not say that. I do not doubt it, although I do not care to pass, as I say, an opinion as a chemist on that.

7141 Q. Do you regard it as a proper subject of study, that is the relation between the water and the water-borne diseases?

A. Most certainly.

Q. And you recognize that it has been made quite an extensive study?

A. I recognize that certain people are engaged in this very legitimate study.

Q. And have been for the last twenty years?

A. For some years back, I think. I cannot place the beginning of the study.

Q. But from a chemical standpoint you have not been able to make it a study?

A. I have not tried from a chemical standpoint.

Q. Being acquainted with the sanitary conditions, and being connected with the State Board of Health and the Chicago Board of Health as an official chemist and in connection with your work for the Sanitary District of Chicago what is the reason you have not given it consideration and study?

A. Because in the employ of the State Board of Health there is a competent bacteriologist and etiologist to whom these questions are always referred. I have not been the official chemist of the city of Chicago for a good many years, since about 1890, and have not therefore, given any opinions.

7142 Q. Professor, at the time of your investigation, what was the amount and character of pollution in the Chicago river from the stock yards of Chicago?

A. I stated in a general way several times,—I think twice, something about the character of this pollution. In the earliest period of these investigations that pollution consisted of a large amount of water which was used in washing carcasses of meat or shreds of organic matter separated in the process of cutting up the meat, in residues from evaporation coming from these various industries, such as slaughtering and canning industries for example, of the contents of stomachs and intestines of the cattle slaughtered, the cattle and hogs slaughtered and of the manure from the cattle from the pens in which the cattle are kept for slaughtering. I explained that in the early history of the stockyards the amount of this matter which was allowed to go into the river was very large but that it decreased greatly when the commercial value of the substances was recognized, so that finally practically everything separable by sedimentation or separable by screens or weirs was taken out, and at the present time the filth which leaves the stock yards is largely of a soluble nature, that is materials which cannot be readily separated by mechanical means. The separation takes place
7143 usually in the packing houses themselves, and also to some extent in a big sewer outside, which is the one main,

principal sewer which drains most of the packing houses, but the packers themselves try to save and do save as much as possible and make use of it largely as a fertilizer, and in making soaps and so on, while what escapes into the large sewer is, or was for a very considerable period, and is yet, if there is sufficient of it to pay, separated in the Brennock sewer. Now, the amount of this that passes into the river at the present time I cannot give exactly. I think I stated some time ago that at the period when my investigations were made it was about ninety tons a day of organic matter escaping in this way.

Q. That was in 1899?

A. Yes, sir. Through the period.

Q. Now in 1886, you said there was about 112 tons daily?

A. In 1886, from experiments I made, I concluded there was that much more escaping in the intervening period. The method of saving and separating this stuff has been improved to some extent.

Q. Now, then, what changes, if any, have occurred since 1899 in the amount of dry organic matter entering the Chicago river from the stock yards sewage, and if so, what amount?

A. I cannot state that very definitely beyond this ex-
7144 planation, that since that period of 1891, these people
saw the importance of retaining within their own establishment matter which formerly was allowed to escape because of the commercial value of the substance.

Q. What was the amount of nitrogen that you estimated was contained in this refuse matter from the stock yards?

A. Well, the amount of nitrogen was approximately somewhere between thirty and forty tons—no, not from the stock yards, excuse me. That includes the determinations made of the total flow. The amount of nitrogen corresponded very closely to the amount of organic matter, being in the neighborhood of one-sixth or one-seventh of the dry organic matter.

Q. Now, what factor do you use in extracting the nitrogen into the equivalent weight of the total organic matter coming from those sources?

A. I have used the usual factor for products of the complex nature of those known to be in existence there,—six and one-fourth.

Q. What do you find the ratio to be of free ammonia to albuminoid ammonia?

A. I don't recall now; I believe I made no statement in regard to that.

7145 Q. You don't remember what the ratio was?

A. No, sir.

Q. Now, Professor, if the refuse matter coming from the stock yards sewers were diluted in Lake Michigan water in a volume equivalent to 250,000 cubic feet a minute, for 24 hours, what amounts would that give you of the various constituents that you recorded in your chemical analyses if expressed in parts per million?

A. Your question is not definite enough to permit an answer to be given. You have not included the number of minutes,—250,000 cubic feet a minute for how long?

Q. Well, we will say for 24 hours?

A. Well, let me see, I will have to figure a little on that. That calls for a calculation which I have not made, and prefer not to make off-hand. It is a matter of arithmetical calculation.

Q. Will you make that?

A. Yes, sir.

Q. You needn't make it right now.

A. I will make that calculation and give it some time.

Q. (Question repeated)?

A. What am I to calculate now?

Q. You have stated that the total solids were so much per 24 hours, per day, from the stock yards.

7146 A. Yes, sir.

Q. Is that calculated, then, on the basis of 250,000 cubic feet of water per minute, for the 24 hours?

A. And you want to know, expressed in parts per million, what these 90 tons would make; is that the proposition?

Q. That's it.

A. Well, that readily appears to be about 90 parts per million of organic matter.

Q. Now, that would be the amount for the various constituents which you reported?

A. Yes, sir.

Q. How much would that be for nitrogen?

A. That would be, if I have made my calculation there correctly, about fourteen, but I wouldn't want to put this in as an absolute calculation until I look it over.

Q. Professor, I believe you stated that in 1899, you estimated that from a population of 1,500,000 people connected with sewers emptying into the Chicago river, that they contributed more than 150 tons per day of dry organic matter and this amount was equivalent to more than 30 tons daily of nitrogen?

A. Yes, I think I have made a statement of that kind.

Q. What is the ratio of the amount of this nitrogen in the form of free ammonia, as compared with the form of al-
7147 buminoid ammonia as compared with that in the form of albuminoid ammonia?

A. The ratio of nitrogen where?

Q. In the 50 tons per day of the dry organic matter?

A. Well, that dry organic matter is not ammonia at all; that is not ammonia.

Q. Is any part of it?

A. There might be, yes, probably a small amount of complex ammonical salts that could be included there, not at all ammonia.

Q Is any of the nitrogen in the form of free ammonia?

A. Not any of this organic matter, no.

Q. What is its nature?

A. This organic matter?

Q. Yes?

A. I have made no very specific investigation to find what it is. I simply judge from the source from which it came, as to about what it was to be.

Q. Now, how did you determine that?

A. Oh, from my knowledge of the stock yards industries, which I have visited hundreds of times in twenty years.

Q. You determined it then from observation?

A. Observation of what goes in there permits me to tell.

7148 Q. Not by chemical analyses?

A. Not by chemical analyses, no. I haven't attempted to differentiate it in that way.

Q. Now, Professor, is it fair to assume that one ton of dry organic matter per day, is generally correct for each 10,000 population in the Chicago Sanitary District, contributing house drainage and industrial waste to the city sewage?

A. That question I cannot answer without some little calculation. By the statement which I have made in the Board of Health report, and the figures which I gave are based on experiments. I would have to reduce those. I think that I made a fair estimate of what was going on at that time.

Q. Now, in what way did you make that estimate?

A. The estimate of the dry organic matter from the stock yards was made—

Q. We are speaking now, Professor, of the house drainage.

A. I made no estimate of the house drainage directly; I made certain examinations of the water at several points.

Q. And that of course, included the drainage from the stock yards, the house drainage and factories of all kinds?

A. Some of it, yes, but most of the stock yards drainage goes through one large sewer. I was aiming to get a pretty fair estimate of that because of the fact that it goes through
7149 the Brennock sewer.

Q. Then you made no examination, did you, with the view of examining that particular factor, what the house drainage is?

A. I couldn't make it in the same way, no, sir.

Q. Did you ever figure out the amount in grams, per capita daily, of the quantity of household drainage and industrial waste, corresponding to and expressed in these constituents which you employed in reporting the results of your chemical analyses?

A. Yes, in this report which I have I think I have such a calculation, but I wouldn't like to make a positive statement about that now.

Q. You don't know what amount in grams it would be?

A. No, sir, I do not.

Q. You never published any such statement, did you?

A. Well, if there is no statement in that report, I haven't published it anywhere else.

Q. Professor, you stated, did you not that in 1890 and 1891 you estimated that five-sixths of the sewage in the stock yards refuse entered the Chicago river and passed into the Illinois and Michigan canal?

A. Yes, I have some such proportion among my statements.

Q. Now, you made that statement in your direct testimony?

A. I believe I did.

7150 Q. Now, upon what basis did you make that estimate?

A. That estimate was made by comparing as well as possible the amount of matter contained in the water west of Bridgeport, that is, the pumping station, with the amount discharged as near as I could estimate it, from the stock yards and other sewers.

Q. In other words, you made a comparison of the two waters?

A. I attempted to make a comparison of the two waters.

Q. How often in the year was that comparison made?

A. These investigations were made largely as I now recall them, in the fall and winter of 1890 and 1891. In that investigation something over 130 examinations were made, but I am not now able to state how they were divided. I think the larger part were concerned with the stock yards sewage itself.

Q. How was that examination made?

A. That examination was made of the sewers in this way: weirs were built in these sewers over which the water was allowed to flow, and the object of that was to get the volume of the water flowing, by methods known to engineers—these measurements I didn't make,—at points in the sewers above the weirs,—the contents were thoroughly stirred up and samples were taken every 15 minutes through 24 hours, and mixed. Employes of the sanitary district made those collections that often. These samples were thrown into large barrels and thoroughly mixed 7151 and brought to me subsequently on the same day, or at the end of 24 hours, for examination, the stock yards sewage coming, therefore, in a very fresh condition for examination. The examinations made then were by the usual methods known to chemists which I have described heretofore. Total solid matter by evaporation was determined, and by careful incineration, by the Drown or perhaps the Drown-Hazen method in a platinum dish under a radiator the organic matters were then burned off at as low a temperature as possible, leaving the inorganic residue. In that way, I say, an average estimate of the organic matter was so obtained, but, as I explained in my direct testimony, this method is not absolutely accurate as chemists understand that term, as in making, for example, a complete organic ultimate analysis, but it is accurate enough for purposes of comparison. The nitrogen was also determined in all these samples by means of the ammonia found by the Kjeldahl process. The incineration and determination of fixed residue was made in every case.

Q. Now, did these estimates take into consideration the times when the current of the Chicago river was reversed?

A. At that time the current in the Chicago river was all towards Bridgeport. The pumps were in operation and drawing the water in that direction.

Q. At the particular time these examinations were made?

7152 A. Yes, sir.

Q. But in these estimates have you included the nitrogen in the form of free ammonia and the chlorine, and the oxygen consumption?

A. Yes, I think those were all included; they were never published.

Q. Do you consider them of any importance?

A. The determination of the free ammonia was important as showing a relatively small amount of decomposition which had already taken place in the stock yards sewer. The chlorine is of no very great importance there, because of the enormous amount of salt used in the packing industries. As a matter of course there is a great volume of salt thrown out there, and therefore I attached no especial importance to its determination.

Q. Do I understand you to say that during this period when these estimates were made as to the amount of sewage in the stock yards refuse entering the Chicago river, and passing into the Illinois and Michigan canal, that the Chicago river did not reverse?

A. Yes, I made that statement from recollection; I would not like to say absolutely that it was not reversed for a short period, but in general I remember that the river was flowing past the pumps.

Q. Did it flow for several years without any reversals whatever?

7153 A. No. There were periods when there were reverses in nearly all years. In wet years there were frequently reverses, as I explained in my direct testimony. I explained that at times of high water, because of the peculiar relation of the Desplaines water-shed and the Chicago river, frequently a very large body of water would come down from the Desplaines in this direction instead of going west or southwest to Riverside. It would break over the low water-shed there and come this way and enter the Chicago river somewhere in the vicinity of these pumps and on these occasions the river very often was carried out to the lake.

Q. Now, when these freshets happened, it flushed out the sewage that had been deposited into these rivers, did it not?

A. In the Chicago river you mean?

Q. Yes?

A. No, not all of it. This freshet from the Desplaines would carry out practically only that part of the sewage which was in the south branch, between the main river and the pumping station. It would not affect, this Desplaines freshet could not affect the north branch or the part of the south branch south of Bridgeport.

Q. How far is the Desplaines from the north branch?

A. The Desplaines from the north branch, north of the city, is not far removed. The north branch and the Des-
7154 plaines river follow in approximately a parallel direction, from somewhere near the Wisconsin line, they come down, one on one side of the water-shed and one on the other.

Q. Now as a matter of fact a freshet in one generally meant a freshet in another, didn't it?

A. No, not at all, the water-shed of the North branch is very much less than the water-shed of the Desplaines, and freshets have very little effect on the North branch.

Q. You know the size and capacity of the pumps at Bridgeport?

A. I have seen those pumps many times through a period of ten years. There was no subject in Chicago more frequently discussed and on which more varied opinions were given, than the capacity of the Bridgeport pumps and it would be foolish for me to attempt to give any accurate definition of what they did.

Q. Professor, what became of the one-sixth of the polluted matter that entered the Chicago river in 1890 and 1891, but which you said, did not enter the Illinois and Michigan canal?

A. Well, an answer can be given to that question only in

a general way. In the river itself and in all streams, there is always some decomposition going on. In the Chicago river this decomposition has often been active enough to be easily visible to the eye. Part of the organic matter disappears
7155 by actual destruction and the products formed pass in the shape of nitrogen and carbonaceous gases into the air. The loss of organic matter can be explained only by this actual destruction mainly through bacterial agency.

Q. Some of the sediment went into the lake, didn't it?

A. At times a portion of the sediment must have found its way into the lake.

Q. What was the condition of the Chicago river from 1886 to 1900 regarding sediment accumulations at the bottom of the stream?

A. I am not able to make any very definite statement as to the condition throughout all of the river, but in the extreme south part of the river, however, there was always a very considerable collection of sediment, and in certain parts of the North branch.

Q. Now, at that time the Chicago river was constantly undergoing purification?

A. There were changes going on all the time in the river, as in all streams with large amounts of organic matter in them.

Q. There was constantly arising foul and putrid gases from it during that time, wasn't there?

A. Yes, the odors in the neighborhood of the river were very unpleasant.

Q. What produced that odor of gas?

A. That is impossible to state, just what were the particu-
7156 lar products of organic decomposition which occasioned the most disagreeable odor. You cannot say. I think that part of this odor is always due to discharge of gas-house waste. These products in the neighborhood of the river have a peculiar so-called aromatic odor—not using that term to describe a pleasant odor, but using it in the sense employed by chemists—a certain aromatic odor, and from the prevalance of that odor I have always believed that gas-house refuse had something to do with it.

Q. As a chemist, what would you say was the cause of it?

A. Well, I don't know. I can ascribe it in part to the products of putrefaction or organic matter and in part to the gas-house refuse which has a very strong and very disagreeable odor, an odor very similar to that which you notice in these rivers.

Q. What produces the decomposition about which you speak?

A. Decomposition in general, in waters containing much organic matter, is a bacterial process.

Q. And you are not familiar with that?

A. I am familiar with it in a general way.

Q. Now, Professor, how does the water in the Chicago river and branches since the opening of the main drainage canal, compare with that existing prior to 1900, as regards the
7157 degree of decomposition which it is undergoing, or has undergone?

A. I have not made any examinations of the Chicago river since the opening of the drainage canal and am therefore unable to make a statement in answer to that question.

Q. Professor, as a chemist, the conditions for decomposition were better in the Chicago river prior to the opening of the drainage canal than since, were they not?

A. Prior to the opening of the drainage canal, some of the conditions for decomposition in a part of the Chicago river, were doubtless somewhat better than after the opening of the canal.

Q. In what way were they better?

A. In this particular, that since the opening of the canal in a certain stretch of the river less time is given for the oxidation or for the completion of these changes, than before.

Q. Is that the only way in which they are better, and the only reason that may be assigned for the conditions being better for decomposition prior than since the opening of the canal?

A. That is the principal reason.

Q. Can you name any other?

A. Nothing that occurs to me now.

7158 Q. You don't know the extent of the advanced degree of decomposition in the river prior to the opening of the canal as compared with what it has been since?

A. No, I do not. I have not made any examination since with which I could compare.

Q. Professor, have you ever investigated the relative change in the amount of free ammonia and albuminoid ammonia, as the sewage undergoes decomposition?

A. Yes, I have made some such investigations.

Q. Now, what is the explanation of this change?

A. By following out the changes through a period of time, we observe a marked increase of free ammonia for a time, and a gradual decrease of albuminoid ammonia. I made once some experiments in which these changes were followed through a period of a number of months.

Q. What caused the changes?

A. In which the free ammonia increased from almost zero to a large figure which I do not now recall, and the albuminoid ammonia decreased correspondingly from a maximum to a very minute figure. These changes were brought about undoubtedly by the usual agency affecting such changes,—bacteria.

Q. Now, that also brought about decomposition in the Chicago river, didn't it?

A. Yes, I believe that bacteria are the main agencies that
7159 work in such decomposition, as I stated a little while ago.

Q. Then the result of these limitations in the method of analyses are due to the change in the two forms of ammonia?

A. Yes, the change in the two forms of ammonia of course is to be considered in our analysis.

Q. Now, then, the results frequently indicate a change which is apparent and not real so far as the total organic matter is concerned?

A. Under artificial conditions that might be true, but the changes as observed in rivers or streams, do have a fairly definite meaning.

Q. Then the analytical results even show putrefactions, which in reality have not taken place?

A. Well, I cannot now recall a case where that is true.

Q. As a chemist what is your opinion on the subject?

A. I would like to consider that some time before I pass an opinion, because the question is not exactly plain to me.

Q. Professor, do you consider that the organic nitrogen as determined by the Kjeldahl method is a more accurate measure of the amount of organic matter in water than albuminoid ammonia?

A. Well, by the Kjeldahl method we obtain the total amount of nitrogen in the organic condition in the water,
7160 while under the most favorable conditions by the albuminoid ammonia process we obtain less.

Q. What percentage?

A. That is quite variable with the character of the substance decomposed. In the decomposition of fresh albumen I have on many occasions found that we obtained practically one-half of the nitrogen as albuminoid ammonia, and practically the whole of it could be obtained by the Kjeldahl process, but there are various decomposition products of albumen, complex products of the decomposition of albumen, products which are formed in the breaking down of the albuminoid molecule, which will give up practically the whole of the nitrogen as albuminoid ammonia, as well as by the Kjeldahl process.

Q. What percentage of organic nitrogen do you get compared with the albuminoid ammonia in your analyses of the waters of the Chicago river and the Illinois and Michigan canal?

A. That I could not answer now directly. It is variable in different places; I do not recall the proportions.

Q. Not variable, are they?

A. Well, the ratio has not been a constant one—I am not able now to give very definite figures from memory.

Q. Professor, do you know what is the population since 1900, that has been contributing house drainage and industrial waste into the main drainage canal by means of the Chicago river?

7161 A. I think I stated that yesterday, about 1,600,000.

Q. Professor, what is the source of the pollution entering the Illinois and Michigan canal since July, 1900, the principal source?

A. The source of the pollution since, is as before, the combined house and general industrial and stock yards sewages.

Q. Are the pumps operated regularly?

A. What pumps?

Q. The pumps at Bridgeport?

A. That is a difficult question to answer; it depends on the stage of politics in Illinois. I don't know.

Q. What do you now consider to have been the normal flow in the old Illinois and Michigan canal in 1900, and what has been the so-called flow since 1900 in the main canal, and when I say the main canal I mean the canal of the Sanitary District of Chicago?

A. As I have explained several times, it is difficult to give a very sharp and close answer as to the flow in the old Illinois and Michigan canal. The flow at that time was assumed to be about 50,000 cubic feet per minute. It is generally believed and I have used this acceptation in my experiments, that the flow was nearly 35,000 cubic feet per minute. In 7162 the main drainage canal, the flow is approximately 250,000 cubic feet per minute.

Q. Are you able to state, Professor, what the lineal velocity of the flow is in the two canals under the conditions of the flow last stated?

A. I am not.

Q. What have your investigations of the old Illinois and Michigan canal indicated as to changes in the polluting matters entering that canal by the time it reaches Lockport?

A. These investigations have disclosed different conditions there. In one series of these experiments the results indicated a very great diminution of the factors measuring the organic pollution. At a later period, when many of the conditions, as far as we could determine were the same, we found only a very slight diminution of these factors in the same flow.

Q. Now, what canal have you reference to?

A. I am speaking of the old Illinois and Michigan canal.

Q. State what the conditions were as to the purification of the water in the Illinois and Michigan canal in 1886?

A. That has been stated in my direct-examination, whether I can find the figures at once, now, I cannot say. My recollection is that the experiments showed a nearly complete destruc- 7163 tion of the organic matter or the breaking down of the nitrogenous products. The loss of organic matter was very marked between Bridgeport and Lockport. This reduction being shown particularly in the change in the free ammonia to the albuminoid ammonia and also in the oxygen consumption, the amount being reduced, the amount as indicated by these determinations being reduced to one-half of what we had at Bridgeport.

Q. Now, will you please state what the corresponding conditions were in 1899?

A. In 1899 at the same place, and for some reason which I am not able to assign in detail, practically no change in the free ammonia, the albuminoid ammonia or the oxygen consumption was observed between these same points,—Bridgeport and Lockport.

Q. Now, you say you are unable to explain the reasons for the difference in the two periods?

A. I am not able to assign any perfectly specific reason for the fact that in one season in this stretch there is an enormous destruction of this nitrogenous matter, while in the other season there is a very much less destruction of the organic matter,—practically no destruction at all.

Q. Is there anything in the realm of the science of chemistry that might explain it?

7164 A. Perhaps not in the field of pure chemistry.

Q. From the standpoint of a scientific sanitary chemist, is there any way in which the same conditions might appertain to any other stream of water?

A. Yes, I believe that might happen elsewhere under certain conditions.

Q. Is there anything in the realm of chemistry by which you can forecast that the same results may obtain at any other time with reference to the Illinois and Michigan canal as shown by the 1886 analyses?

A. That is a pretty broad question to answer definitely. I would not like to say definitely that with our present chemical knowledge and our present power of analyzing water that we would be able to forecast exactly what would take place in a given stream in a certain time. On the other hand I would not like to say that we would be unable to forecast what in general might take place there. Inasmuch as this kind of a change must depend on the activity of bacterial organisms, any chemical factor which would lessen the activity or power of doing chemical work, of these organisms would necessarily interfere with the destruction of the organic matter. Now I am not prepared to state whether with our present knowledge, a chemist could detect that addition of some chemical element which would interfere with or impede the bacterial activity.

Q. With your present chemical knowledge, and the pres-
7165 ent state of the science of chemistry, can it be stated?

A. I shouldn't like to state it; I don't know whether anyone else could or not.

Q. Then the question as to the cause of the change in the purification, the reasons for the change, the facilities for the change as observed from the analyses, cannot be ascertained so far as a comparison or examination of the waters for the two periods, to-wit, 1886 and 1889?

A. I am not able to assign any specific explanation.

ADJOURNED until 2:00 P. M., same day.

7166 2:00 P. M., Wednesday, September 30th, 1903. Continuation pursuant to adjournment. Present, the Commissioner, and same counsel representing the respective parties.

PROF. JOHN H. LONG,

resumed the stand for further cross-examination by Mr. Jeffries and testified as follows:

Q. Professor, we were speaking of the comparative difference in the purification observed in the Illinois and Michigan Canal from the analyses of 1886, and that taken in 1899.

A. Yes.

Q. Do you know of any conditions as to flow or as to the amount or kind of impurity or any other matter which would account for this difference?

A. Not positively.

Q. You have no knowledge upon that subject?

A. Nothing definite. Nothing to state, no.

Q. That you account as definite or reliable?

A. No.

Q. You regard the sewage matter from Chicago in its
7167 original condition as detrimental to the quality of any water supply with which it is mixed, do you not?

A. I should consider such mixtures, producing a product unfit to use in general.

Q. Now when you state that in your judgment the sewage matter from Chicago was not injurious to the water supply of St. Louis, you were relying, were you not, upon the purification which takes place *en route*; or assuming that that purification is of the kind and extent such as has been shown by your analyses?

A. That was the basis of my answer.

Q. Do you know with certainty that your analyses covered all the conditions that there are?

A. They covered all of the conditions which I considered necessary to reach the conclusion expressed; the conditions are all explained by my report as far as I know them, and I think they have been explained here.

Q. State briefly the principal conditions that were covered by those analyses and which you consider as necessary?

A. Well, I determined in those analyses the factors measuring organic matter, as judged from the oxygen consumption, the albuminoid ammonia, free ammonia,—the presence of nitrites and nitrates; that is, I observed the usual chemical
7168 conditions, and in addition to these the results of so-called bacterial chemical tests or investigations.

Q. Now do these analyses that you have introduced in evidence fully cover flood periods in the Illinois river?

A. They cover some periods of high water, probably not the maximum or excessive floods.

Q. Do they cover cold weather periods?

A. Yes, to some extent they cover cold weather periods too.

Q. Do they cover periods particularly when the river was frozen over with ice?

A. In the recent analyses I don't recall that the river was frozen over when the samples were collected.

Q. Since the canal was opened?

A. Since the canal was opened.

Q. It freezes over, does it not?

A. That I will not say from my own observation; I don't know.

Q. Have you been on the river in the winter time when the water was frozen over with ice?

A. I have not.

Q. Then you would not undertake to express an opinion as to the sanitary condition of that water in the winter time, when the water was frozen over with ice?

A. I have only expressed an opinion as to the condition 7169 at the periods covered by my investigations.

Q. How many days do those respective periods cover?

A. That I cannot tell, except by reference to the dates and the tables. Through some months of the summer and spring or fall of this two years—four or five months I think in the two cases.

Q. No one of the periods of investigation made by you cover the entire year?

A. No, by myself personally, no investigations were conducted through the whole year.

Q. Professor, if a very marked purification was obtained in the Illinois and Michigan canal in 1886, and practically no purification in 1899, the conditions remaining the same, is it not possible that the conditions of purification as you have observed them since the opening of the drainage canal—since the drainage canal has been in operation, have been at times changed in some way, unknown to you, so that the water has passed down the Illinois river with a lack of purification corresponding to that which you observed in the Illinois and Michigan canal in 1899?

A. No, I would not be willing to admit that in general, because in leaving the Illinois and Michigan canal, the disturbing factors which interfered with the oxidation in 1899, have evidently largely disappeared, because of the observed 7170 fact that the oxidation has gone on further down. The pouring in of this canal water, in which the oxidation in that later or second period, was very much retarded, into the river below apparently restored the conditions of oxidation, so we find a better effect below than would be pre-supposed from what we observed from the canal itself. Hence I would not like to conclude, or would not conclude that there might possibly be conditions interfering with the oxidation in the whole river below.

Q. Do you know that the change of the character just mentioned, has not taken place in the Illinois river since the drainage canal has been opened?

A. I don't know that because I have not recognized by investigations, such condition.

Q. Then you don't know that the matter so discharged into the drainage canal and into the Illinois river from the Sanitary District has always been such as not to be innocuous?

A. *I make positive statements only about the periods* which I have covered in my investigation. I think that is what I have done in my previous statements.

Q. You know nothing then about what the conditions were, or what changes took place during other times?

A. I would not say from any direct personal experience, what the changes have been in other times.

7171 Q. And you speak of the condition at other times simply from analogy with those that were in existence at the time you made the examination?

A. I do, yes, where I speak of other times at all.

Q. Do you know the actual dates or time in the winter season that these examinations were made, and that the winter conditions were observed by you?

A. The dates are given in my report. I cannot recall them off-hand.

Q. Now, professor, assume that the Illinois river was frozen over with ice the entire distance from the entrance of the canal into the Desplaines, to Grafton, would the sewage of Chicago during that time have any effect upon the condition of the water at Grafton?

A. An exact and definite reply cannot be given to such a question from any personal experience I have had, extending through an investigation as long as that.

Q. Have you ever made an examination as a sanitary chemist, of the condition of the water in any river when it was completely frozen over with ice?

A. I have not.

Q. Do you consider that fact as material in determining the sanitary condition of the water, following down the river from one end of the year to the other?

7172 A. Yes, in general I would consider the question of temperature and all questions of the exclusion of the air by ice, as having some bearing on this question.

Q. Isn't it a fact that the means of purification are more adequate in the summer season than in the winter season?

A. Yes, it is in general true, that the changes which we describe in broad terms as oxidation, are more characteristic in the summer season than in the winter season.

Q. Then in making an examination of the water of the Illinois river with the view of determining its sanitary conditions, have you not omitted a period of time which is material to enable a correct determination of that question?

A. One of the factors necessary to reach a conclusion for the whole year has not been considered in this investigation. My conclusions extend to the period through which my investigations were carried.

Q. Do you consider flood periods as important in determining the sanitary condition of water in the running stream?

A. Yes, as was explained at some length yesterday, the condition of floods in the Illinois river has a bearing on this question.

Q. And I understand you to say that you have omitted from your analyses and examinations, flood periods in the
7173 Illinois river since the opening of the drainage canal?

A. I think I said I omitted any very large flood periods. I do not recall that any very extended flood period was embraced in these examinations.

Q. Can you recall any period of flood or floods which is included in this examination for the determination of the sanitary condition of the water, and state whether or not the water was examined at the flood periods for the purpose of determining the chemical conditions and sanitary condition of that water during flood times alone?

A. The investigations made in the earlier part of 1900, I think, came the nearest to the observation in flood period. In the investigations of 1899, as I recall, the water was in general, not high, and in the investigations of the later part of 1900, the water was I believe, in general, not very high, but in the earlier investigations that year there was some high water.

Q. Did the high water continue throughout the entire series of examinations that you made at any one particular period?

A. It did not.

Q. In making these examinations in high water time, which you speak of, were the samples so taken as to follow the volume of water from the source of the flood to the mouth of
7174 the Illinois river with a view of determining the chemical changes that took place in that water during the flood time?

A. In this period of 1900, in the early part of 1900, to which I refer, I believe the samples were taken in the upper part of the river and that they also extended to Grafton.

Q. Were the samples during any period of your examination taken in the manner indicated in my next previous question?

A. Yes, they were taken through 1899 and 1900 from the source to the mouth of the river. Your last question evidently does not refer to flood periods.

Q. Now then, were they so taken during any of those periods for the purpose of determining the conditions that existed all along the river during that flood period, following the flood from the source of the flood to the mouth of the river?

A. They were not.

Q. Professor, have you made any examination of the water of the Illinois river so as to enable you to determine its sanitary condition at its mouth, or at Grafton in January and February, 1902?

A. I believe that is the period of the last examinations made—1902. Let me see now what the dates were (Witness refers to book). In 1902 the period covered was the latter part of February and March.

Q. Now how do those examinations that were made in
7175 February and March, 1902, compare with those that were made the preceding summer?

A. Well, in general, without hunting up the figures exactly, I can say that during the later period, during the early spring period of 1902, we have a greater amount of the unoxidized free ammonia than in the last examination made, and before this period—that was in the fall of 1901. As compared with those examinations, we have as would naturally be expected, a greater amount of albuminoid ammonia, and especially a greater amount of the free ammonia, which represents a much later stage always, in oxidation,—and larger amounts also of the substances which are measured by the oxygen consumption,—a condition which would naturally be expected at different seasons.

Q. Now, I will ask you if from your analyses made in February and March, 1902, the water in the Illinois river at Grafton, is not shown to be in a more polluted condition, and in worse condition for domestic purposes, than the examinations made by you in the summer of 1901?

A. I said in general that I do not consider this water or any of the waters in comparison and under discussion, suitable waters for domestic consumption. That I wish to be understood
on distinctly. I do not and have not said at any time, that
7176 the water of the Illinois river at its mouth, at Grafton,
could be considered as good suitable water.

As to the second part of your question, whether this water is less pure in the colder season than in the warmer season, as measured by these several factors, I would say yes. They indicate a much less degree of oxidation in the colder weather than in the warmer times, but at no time would I consider them good, wholesome, safe, waters.

Q. Now the degree of purification is very much less, is it not?

A. The degree of purification as measured by the oxidation of ammonia is decidedly less, but free ammonia, when it appears, is one of the last stages in the oxidation of organic matter. The main stages have been long past. When we reach ammonia we are in a comparatively very advanced condition of oxidation, when we consider the breaking down of protein molecules, whose molecular weights are 15,000 or 16,000, and reach bodies like ammonia, or even the more complex substances,—urea, or uric acid, the molecular weights of which are very small as compared with the molecular weights for the proteins,—we have reached a condition in which the substances remaining can scarcely be compared with the original substances.

Q. I will ask you, professor, if that condition is not usually

reached in sewers before it reaches the outlet of those
7177 sewers?

A. It is reached largely by one portion of the substance in sewers. One of the common products in sewers is urea, which represents a very large fraction of the excretion of human urine. Urea is a body which undergoes hydrolysis very rapidly, and it breaks down, yielding ammonia, and therefore ammonia does appear early in the sewers.

Q. Now professor, the conditions shown by the analyses in February and March, 1902, would be very much worse if the samples had been taken in the latter part of December and January preceding, would they not?

A. Why, there is nothing whatever to indicate that they would be worse.

Q. Is there anything to indicate the reverse?

A. I have nothing to indicate either one way or the other.

Q. Do you know anything on the subject that would give light?

A. At the present moment I cannot recall from my own experience anything which would throw light on this particular question, but the temperature in February in this latitude is usually as low as at any time in the year, and we can scarcely expect any worse condition in December than in Feb-
7178 ruary?

Q. How is it in March?

A. In March in this latitude we generally have just about as bad and ugly cold weather, as we have in January.

Q. Do you know the character of the weather they have in the lower Illinois river towns?

A. The lower Illinois river was bad at those times; that is, the weather was cold.

Q. Do you know when the ice forms on the lower Illinois river; what part of the year?

A. Not absolutely, and the amount of ice in the lower Illinois river as I recall, is at no time of the year very great.

Q. Do you know what time the ice breaks up upon the lower Illinois river?

A. Not absolutely, no.

Q. Now professor, were not all these samples of water you used for the purpose of determining the character of the water in the Illinois river taken during extreme low water time or periods?

A. As to whether they were taken during extreme low water periods I am not able to state very definitely. From my recollection of 1899 and the summer of 1900, the seasons were pretty dry and the water relatively low, I believe, but as 7179 to whether they were extreme low water or not, I cannot now say.

Q. But like those that were taken during high water, none of the samples were selected during the respective periods for the purpose of determining the condition of the water in extreme low water time—

A. For that purpose, no, not as I recall now. At least it was not the intention. They were to take them as long in the season as they could. How low the water was in either one of those years, I cannot now say.

Q. Professor, you stated, I believe, that albuminoid ammonia and oxygen absorption are more characteristic of vegetable organic matter than of sewage?

A. No; you have not stated my testimony quite correctly there.

Q. Well, what did you state?

A. Well I have stated quite a number of things, and I do not know now what you refer to.

Q. Well, what are the characteristics of vegetable origin as distinguished from sewage origin?

A. I was pretty careful not to go into any sharp characterization of those things. I stated this much, as I recall, that under certain circumstances we are able to know cer- 7180 tain distinctions between vegetable matter and animal matter, and I think I explained here why it was a chemical impossibility—

Q. Then you didn't go into that discussion of those perhaps, for the reason that you were not able to do so from the standpoint of a chemist?

A. I explained that in a great majority of cases, such a sharp distinction is not possible.

Q. And that statement is made in view of the fact that it cannot be determined from a chemical analysis as stated yesterday, the source of the pollution, whether it is sewage, swamp, or from what source?

A. It is not always possible to draw a conclusion from such examinations. This, however, is true, as I explained, that in the vegetable extracts in general, because of the character of the matter going into water from vegetation, the ratio or relation of the oxygen consumption figure to the albuminoid figure, is comparatively high, these vegetable substances containing comparatively more of the carbo-hydrates or carbo-hydrate derivatives, bodies, than protein or protein derivates bodies, so as the vegetable substances break down, we have a much more rapid diminution of protein factors than we have of the carbohydrate factors, so that in waters of vegetable origin there is usually remaining, a pretty high factor for oxygen consumption. 7181

Q. Is there any way to determine from the standpoint of a chemist whether the pollution in the Illinois river at its mouth is sewage pollution or pollution of some other character?

A. I should not attempt to make any such characterizations there.

Q. Then why is it that you say the water of the Illinois river at its mouth is not fit for drinking purposes?

A. I explained this morning that I consider any water unfit for household purposes or drinking purposes, which receives a large amount of organic matter from any source. I make a general conclusion there,—the Illinois river, the Mississippi river and the Missouri river.

Q. Now is that without reference to the character of the organic matter that is deposited in the river?

A. In general I object to any large amount of organic matter of any kind in a river.

Q. Now then, which to you as a sanitary chemist, would be more objectionable, deposits from sewers and from a country thickly inhabited, and the water from a river flowing through a country sparsely inhabited?

A. In general I should object more to the water from the sewered region than to the water from the uninhabited region.

7182 Q. Do you know the difference in the impurities and the extent of the impurities that are deposited in the Illinois river than those in the Missouri river?

A. Not absolutely, but I have some ideas on the subject.

Q. Do you know the comparative volume of water flowing out at the mouth of both streams?

A. No, but the Missouri is usually a very much greater volume than the Illinois, both receiving enormous amounts of organic filth.

Q. Do you know whether or not the organic matter contained in the Missouri river or any part of it, is harmful or harmless?

A. Well, I should consider from general knowledge of the situation, a part of the organic matter discharged at Omaha and Council Bluffs, and Kansas City and other points, as very objectionable, and as—

Q. Then I will ask you if that is not an exceedingly small portion of pollution, considering the volume of water flowing down the Missouri river as compared to the pollution of the water in the Illinois river by the city of Chicago?

A. As compared with the pollution of the Illinois river by Chicago, and most especially by Peoria, I consider the pollution from the household waste and stock yards industries 7183 of Omaha and Kansas City, as small, comparatively—or relatively smaller than the amount of pollution from these places, but it is still large.

Q. But it is very much smaller than that of Chicago is it not?

A. From these sources it is smaller—considerably smaller than the original discharge at Chicago.

Q. Do you know the time distance of the water from Omaha and Council Bluffs to St. Louis?

A. No, not of my own knowledge, nor the distance from Kansas City to St. Louis, except as it was brought out in the testimony as given in St. Louis. The time distance from Kansas City to St. Louis being so much less than the time distance from Chicago to St. Louis as to very materially counteract the effect of the greater amount of organic matter from Chicago.

Q. What do you mean by "very materially"?

A. Well in a very large proportion, the time distance from St. Louis to Kansas City, as I recall from the testimony given in St. Louis, is probably not one-fifth of the time distance from Chicago to St. Louis.

Q. Do you know the number of days required for water to flow from Omaha and Council Bluffs to St. Louis?

7184 A. Not exactly. From Kansas City a period of three or four days was given. I do not recall the statement of any period for Omaha or Council Bluffs.

Q. At what stage of the water?

A. That I do not now recall.

Q. Then you consider that the sewage from Omaha would pollute the water in the Mississippi river at St. Louis, do you?

A. I did not make that statement at all. I simply spoke of the large amount of organic matter discharged, at those places.

Q. I will ask you as a sanitary chemist, if the discharge of the sewage of Omaha into the Missouri river affects the sanitary condition of the water of the Mississippi river at St. Louis?

A. As a sanitary chemist I should feel that this discharge of organic matter coming down very rapidly, in a swiftly flowing stream would be a factor to be considered.

Q. Now I will ask you if in your opinion as a sanitary chemist, the discharge of the sewage of Chicago,—into the Illinois river, would affect the sanitary condition of the water at Grafton?

A. In reply to that question I will state, as I just stated for the Missouri river, that this discharge would be an extremely important factor to be considered in forming any opinion regarding the purity of the water at the mouth of the Illinois river. 7185

Q. And for the same reason it would be an important factor for St. Louis?

A. It would be a factor to be considered in any case.

Q. Now what is your opinion as to the strength of that as a factor?

A. From the tables which I have presented, and from the curves which I drew, illustrating some of these tables, I made the statement that I believed the pollution from Chicago is the least important, and a comparatively unimportant factor in any residual pollution left at the mouth of the Illinois river.

Q. Well, it is a factor?

A. All these things are factors to be considered of course, but I stated further that the determinations made through these investigations, show a larger amount of organic matter as measured in the usual way at the mouth of the Illinois river, than can be well accounted for by the contribution of the tributaries and the contribution of Peoria, so that the Chicago contribution is completely covered up and lost sight of and minimized as compared with the other.

Q. Now you talked of the organic matter?

A. Yes.

7186 Q. Do you know the different characteristics of the Missouri river with reference to sand-beds, and the turbidity of the water as compared with that of the Illinois river proper, and its tributaries, aside from the sewage of Chicago?

A. Yes, I am pretty familiar with the appearance of the Missouri river, its turbidity and the various conditions along the river.

Q. I will ask you if there is not more known harmless organic matter in the Missouri river than there is in the Illinois river?

A. No, I would say decidedly not. We have no proof that the products of organic decomposition left in the Missouri river are any less harmful than the decomposition left in the Illinois river.

Q. Now then, professor, in considering that proposition and in making the statement that you have just made, have you taken into consideration the character of the soil through which the rivers run and the population residing on those rivers and their tributaries?

A. I have most decidedly.

Q. And have you taken into consideration the volume of the stream flow?

A. Certainly; certainly.

7187 Q. Then one batch of the organic matter is just as bad as another, isn't it?

A. That doesn't follow from anything I have said at all.

I should say "No." Some organic matter is very much worse than others.

Q. Take the nitrites as a measure of organic matter; what does it show?

A. The showing from nitrites is an extremely uncertain thing, because nitrites are products of partial oxidation, and also in certain conditions of reduction, and of all the factors which have been discussed by sanitarians, the nitrite factor is one of the least certain.

Q. What do accumulations of these show?

A. It shows that there is a certain amount of substance of original complex nitrogenous origin which has not yet been completely oxidized, but it doesn't show what it comes from or what it is.

Q. Now we are comparing the water of the two rivers at the mouth. What river shows the more of nitrites?

A. I haven't made any examinations there; that is, I don't recall. I can look that up presently.

Q. (Question repeated).

A. Well, there is a great deal of nitrite in the Illinois river, —more than in the Missouri river, which simply indicates
7188 this, that there is a larger amount of nitrites in that form
which has yet to be oxidized, whether that nitrogen came originally in ammonical form, or from the nitrate form, we are absolutely unable to determine.

Q. But it is there nevertheless?

A. It is there, and as such, it hasn't any importance one way or the other.

Q. Professor, do you consider a comparison of the gross organic matter contained in the waters of the two rivers a fair comparison without knowing more about them, than the gross organic matter contained in the water?

A. In drawing a conclusion from the observation of organic matter I should want to know, as I explained yesterday, that a chemist should know, in all cases, something about the original conditions along the river giving rise to this organic matter.

Q. You know about the source of the organic matter in the two rivers. Now I will ask you if it is a fair comparison.

A. Yes, I should consider the comparison a perfectly fair one. The organic matter left in the river is in itself harmless.—That must be admitted. The organic matter as such is harmless.—in its advanced stage of decomposition. The comparison therefore is a fair one.

7189 Q. That is, it is harmless so far as the chemical tests show?

A. Yes, and undoubtedly as far as any test can show, that this residual organic matter must be harmless in either river; that it as far as its capability of producing disease is concerned

Q. Then why is it condemned for drinking purposes?

A. I have stated in general that I should condemn water containing any large amount of substance other than water, for the reason that along with this organic matter other things may enter which are not harmless.

Q. What are they?

A. This organic matter of course, supports a certain amount of organic life which we object to.

Q. Now why do we object to it?

A. I object to that from the opinions of the class of sanitarians referred to who have worked on the modern theory of diseases, (I cannot give an original opinion) that some of these living forms of organic matter are the important agencies in the production of disease; that is, I borrow from the knowledge of others in coming to a conclusion regarding the harmfulness of the living organic matter.

Q. Now do you take that into account as a factor in
7190 comparing the waters of the Illinois river at its mouth with those of the Missouri river at its mouth?

A. I did in my statement yesterday refer distinctly to the fact that the determinations measuring what is called the bacterial contamination in the mouth of the Missouri are more pronounced than those in the mouth of the Illinois.

Q. What do you mean by bacterial contamination?

A. I mean the presence of those organisms which are able to decompose complex nitrogenous matter, break down complex nitrogenous matters, and yield the aromatic compound or substance known as indol, that very long experience has shown to be a reaction produced in waters by certain kinds of bacteria, a

reaction which, however, can be brought about in laboratories by other agencies. In addition to this we include in this pollution all those substances or bodies, which are able to decompose carbo-hydrates, with the liberation of acid, which is recognized in turn by its power of coagulating milk. If therefore, we expose milk to the action of water under proper conditions, the speedy coagulation of that milk points to the presence of a relatively large number of these micro-organisms which decompose the sugar in the milk and liberate the acid, which precipitates the casein of the milk, and further, in addition to that, we detect the presence of these micro-organisms by the activity of
the liberation of certain gases, when the water is mixed
7191 with a solution containing a constituent which the bac-
teria will decompose with the liberation of gases. Certain carbo-hydrate substances are decomposed by the bacteria yielding several gases, particularly carbonaceous gases, carbon-dioxide gas, some of them cause even the liberation of methane. These factors are pronounced in the Missouri river, more pronounced there than in the Illinois river.

Q. How do all these things indicate the quality of the water?

A. Well, these things simply point to the presence of a certain kind of pollution, the presence of certain micro-organisms which may or may not be pathogenic. I pronounce no opinion on that.

Q. Now then, what particular character of pollution is indicated by any particular chemical constituent in the water?

A. Ammonia and albuminoid ammonia indicate an original pollution with, at some time, nitrogenous matter of some kind. What, I will not attempt to say. The oxygen consumption reaction indicates also the presence of organic matter in the water, because we know from long experience that the mineral substances in the water are not able to bring about the production of permanganate in this way.

Q. Are you able to determine, Professor, from any of
7192 these above kinds of constituents that you have in the
water, the character of the pollution contained in that water?

A. I will say in general that I cannot draw any very sharp conclusions from that, from those determinations.

Q. Then, how can you tell about the absence of any sewage matter at Chicago at the mouth of the Illinois river?

A. In regard to the question of the presence or absence of sewage matter at the mouth of the Illinois river I have reached my conclusions by observing the very rapid rate of change of organic matter as we go down the river, reaching finally a condition where the organic matter as measured by the tests is not at all larger than would be properly accounted for by what is going in from the tributaries and from the great contamination at Peoria.

Q. Now, then, do you know whether or not these certain smaller micro-organisms coming from Chicago that feed upon this decomposed matter, that continually feed upon the decomposition in the water, are absent at Grafton or not?

MR. TODD: I object to the question on the ground that the witness has not testified that any micro-organisms come from Chicago, and for the additional reason that the witness has disclaimed any desire or knowledge to testify as to bacteriology or epidemiology, but merely as a chemist.

7193 MR. JEFFRIES: And I submit in response to the objection that the witness has stated in evidence, that he presents the ability and presence of these certain micro-organisms as one of the material reasons upon which and by which he pronounces the water unsafe for drinking purposes, that receives the sewage discharge of the city and for the further reason that the result of certain micro-organism tests are recorded in the tables of analyses made by this witness.

MR. TODD: I still suggest that the evidence doesn't show that the witness has testified that any micro-organisms came from Chicago and got to Grafton.

Q. (Question repeated.)

A. I don't know whether any of these micro-organisms started at Chicago or somewhere else.

MR. JEFFRIES: You have answered the objection and not the question.

Q. (Question repeated.)

JUDGE SPRINGER: Do you mean by that to ask this witness whether the micro-organisms that start at Chicago, have disappeared at Grafton; is that what you mean?

MR. JEFFRIES: No, sir; I want him to tell—

THE WITNESS: I don't know that any micro-organisms ever get to Grafton from Chicago. Therefore I cannot answer.

Q. In other words, you do not know whether they are there or not?

7194 A. I don't know that any Chicago micro-organisms are there or not.

Q. There are micro-organisms there, are there not?

A. I should judge so from these reactions, but whether they are Chicago micro-organisms or not I don't know.

Q. Are they the same kind of micro-organisms that go over the Bear Trap Dam?

A. I wouldn't attempt to say that; I am not a bacteriologist; that is a question for another kind of an expert.

Q. In other words, Professor, so far as the science of chemistry and bacteriological chemistry go, you are unable to determine the presence or absence of micro-organisms that are discharged from Chicago into the Illinois river at Grafton. In other words, you are unable to determine at Gratfon?

A. I am unable to make such a determination at Grafton.

Q. In other words, from the standpoint of the science of chemistry and of bacteriological chemistry, there is no way of making such determination?

A. There is not.

Q. Now, Professor, I will ask you if from your experience as a sanitary chemist, and your experience in the science of bacteriological chemistry, if there isn't more of the polluted

7195 matter and micro-organisms in the water during the cold seasons of the year at Grafton, than there is in the summer time, comparatively speaking. In other words, doesn't this scientific investigation show a greater degree of reduction in the summer time than in the cool seasons of the year?

A. In general that is true, but the bacterial chemical tests at the mouth of the Illinois river at Grafton in the cool or colder seasons, February and March, 1902, do not show a markedly greater or appreciably greater contamination than during the warmer seasons.

Q. Professor, what significance do you attribute to this certain kind of bacteria that you find in the water from your analyses, as to the sanitary condition of the water for drinking purposes?

A. The presence of some of these bacteria is suggestive of the presence of substances which are widely decomposed, or greatly decomposed. We have nothing present which can yield indol, and the bacteria which thrive on these matters so decomposed, therefore, tend to disappear. Now, the fact of the absence in general of these bacteria at the mouth of the Illinois river, is a very strong suggestion of the breaking down of the original protein matters beyond that stage where such bacteria thrive, certain bacteria thriving, as we know from chemical experience, on original protein matter, or protein-
7196 like matter not far removed from the original protein
matter, either on original protein molecule or the albuminoid molecule or the peptone molecule derived from it, but as we continue disintegration or breaking down of these molecules, we reach gradually bodies which will not support certain kinds of bacterial life, that is, where the original proteins can support certain kinds of bacteria the more advanced products of the decomposition of this protein cannot. The absence of these bacteria then, through the investigation made at the mouth of the Illinois river, is a very strong suggestion of the practical absence of that kind of matter.

Q. In other words, it suggests the absence of that kind of bacteria?

A. It shows the absence of that kind of bacteria.

Q. Now, then, showing the absence of bacteria, do you know whether the bacteria that is absent, is harmful bacteria or not?

A. I do not know, as far as producing disease is concerned.

Q. Do you know whether it shows the absence of bacteria that are harmful?

A. No, I do not. There is no close relation between those
that I am familiar with, as far as each bacterial chemical
7197 reaction is concerned.

Q. Do you know whether or not these indol-producing bacteria have any relation to the bacteria producing diseases?

A. No, not in a general way. This fact, however, can be drawn from a general knowledge of physiological chemistry, that indol producing bacteria are practically always present in the human system whether diseased or not. They do not produce disease there.

Q. In other words, then, they are supposed to be a harmless bacteria?

A. I couldn't say it, because they are plural. I wouldn't pretend to testify to that anyhow. There is more than one kind of bacterium of that nature, but in so far as I know, they are not what bacteriologists call pathogenic or disease producing.

Q. Then, practically speaking, they are harmless?

A. I think most of these particular things are in themselves harmless.

Q. And so far as you know, all the bacteria that you have studied are harmless?

A. I have made no experiments to determine their disease-producing character.

7198 Q. How do you know, and upon what premises do you base your conclusion, then, when you say that the water at Grafton has lost all of its pollution from Chicago?

A. Well, that is the factor which I have just spoken of as a very important one in reaching that conclusion. If there was original complex organic matter left there, we should unquestionably find the class of bacteria which prey on that matter, but those bacteria not being there, we have the strongest kind of a suggestion that the organic matter has been so decomposed it will not support them.

Q. But reasoning of that character, or an analogy of that kind, is not a reliable analysis. You cannot associate in the same way the bacteria that are harmless with those that are harmful?

A. No, that doesn't follow at all. There is no necessary relation there. I am speaking of the disappearance of protein matter as dependent on, or as in a measure indicated by the disappearance of the bacteria, which are usually associated with decomposing matter.

Q. Professor, I wish you would turn to table No. 4, read in evidence in your direct examination, and giving the result of your analyses of the water at Grafton at the mouth of the Illinois river in February and March, 1902?

A. Yes, sir.

7199 Q. Now, I will ask you to note the rapidity of the coagulation of milk, in those samples taken February 24, 25, 26 and 27th? What do you find there?

A. I find that the rapidity there as given is comparatively slow. Two cases no coagulation; in other cases through 24 hours.

Q. And one case at 20 hours?

A. You gave me four numbers, did you not?

Q. That's right. Now, pass through the month of March, the 3rd, 4th, 5th, 6th, 10th, 11th, 17th and 18th?

A. Yes, we find a period of 20 hours in March, one of 36 hours in one case. The period was rapid inside of ten or twelve hours undoubtedly, and the next is 24, 30, 16, 24 and 18 hours.

Q. Now, how was it as to indol?

A. Indol out of thirteen tests I believe, was recognized twice. In regard to the coagulation of milk, of course it was well known that the bacteria producing this coagulation could come from many sources, derived from cow pastures as well as any other source.

Q. Will you state specifically that it doesn't come from Chicago?

A. I do not pretend to state that it doesn't come from Chicago.

7200 Q. But you do state that you do not know from what source it comes?

A. I will state that I do not know from what source these bacteria which coagulate milk, come; but since the matter has been referred to, I will state that the Illinois as compared with the Missouri river shows a very much less marked indol reaction in the Illinois than in the Missouri. We have production of indol twice in thirteen cases in the Illinois, while we had six times out of eight for the Missouri.

Q. Do you consider the information as to indol invaluable in forming an opinion as to the sanitary condition of the water?

A. No, I consider it one of the valuable points, not one of the absolutely essential points, but one of the valuable points to be considered, along with a great many others.

Q. Why do you say "considered?"

A. From the statements I have already made regarding the general character of the substances known to physiologists which support organisms which produce this indol reaction.

Q. You cannot determine, then, from the chemical analyses, and from the different constituents contained in the water the exact significance of any one constituent?

7201 A. The absolutely exact significance of any one constituent would be extremely hard to give; practically impossible.

Q. Now, then, can you give the significance of any two constituents?

A. Significance in what way?

Q. From their presence in determining the particular character of the pollution, or the wholesomeness of the water?

A. Not in a great number of cases. Perhaps in a great majority of the cases the determination of two constituents alone would not afford such information.

Q. Now, then, is there any particular case or instance, throughout your whole examination of the water in the Illinois river where any two of these properties enables you to determine the character of the pollution, so far as the wholesomeness of the water was concerned?

A. Yes, that is fairly easily answered. I find a certain large amount of albuminoid ammonia, for example, at Peoria,—a very large amount. I can say that the pollution occasioning that is highly nitrogenous. I can say that without hesitation, it is more than comes from any ordinary source and I should condemn the water immediately on that determination alone.

Q. Now, then, is there any graduated scale by which ammonia in the water may be reduced until it becomes permissible?

7202 A. There is no gradual scale which will obtain for all waters. As I explained this morning, we have to judge the waters very largely by what we know of their sources. I explained that an amount of free ammonia, for example which would be extremely suspicious in Lake Michigan would be regarded as perfectly normal and natural in an artesian well, so there isn't any graduated scale. I know that at one time sanitarians attempted to prescribe limits of that kind, but they are not now regarded as of much value.

Q. That was before the science of bacteriology came into existence, wasn't it?

A. Yes, sir.

Q. And for some time afterwards?

A. Yes, sir, and also before the method of chemical water analysis had been fully developed, and before data from various sources had been compared, so as to see the meaning of these data, their general bearing.

Q. Now, are there any two constituents in the water or in the samples of water taken at the mouth of the Illinois river at Grafton, which will enable you or do enable you to determine the character of the pollution in that water?

A. I will say as I have said before, I cannot attempt to state exactly the character of the residual pollution, whether from two or from all of the chemical determinations I have made.

7203 Q. Are the nitrites in water characteristic of organic matter—animal organic matter?

A. Not necessarily, no. The fact that nitrites may come from the oxidation of ammonia, or from the reduction of nitrates, shows that they cannot be taken as characteristic.

Q. Are they more characteristic of sewage pollution than of pollution of some other character?

A. Not necessarily. It would depend very largely upon the drainage area in which the water is found, for example, agricultural lands, which have been manured with certain kinds of salts, particularly, show a reduction of those salts to the nitrite condition, and even to the condition of free ammonia, with the loss of nitrogen. Now, if such soil drained into a water, we can have and do have, as investigations have shown, nitrites present, which cannot be considered as derived from animal origin.

Q. Has that been proven?

A. That has been proven from the examination of waters draining from such places. In general I have said that because sewage contains more nitrogen than the vegetable products do, we should naturally expect more of these products of oxidation there than we do from other places. It would naturally and necessarily follow.

7204 Q. Now, Professor, take the two rivers with cities situated upon their respective water-sheds, which discharge their sewage into those rivers, and the samples of but one water, show an average of .034 parts of nitrogen as nitrites, and the other showing .0006 nitrogen as nitrites, what significance would you give to those two constituents and their relative importance?

A. Well, it would not be possible—as I practically answered the same question some time ago, it would not be possible to draw any very sharp conclusions from such a consideration. The large amount of nitrites in one place you have mentioned, may come from imperfect oxidation of ammonia, but it may come from a reduction of the nitrate already formed, if this nitrate happens to be present with a considerable amount of fresh organic matter, for instance, such as would be left in the stream by the death and decomposition of water plants. We have there a condition similar to that which has been observed frequently by agricultural chemists; there the reduction of nitrates may follow. So from that fact it is very difficult and practically an impossible matter to draw any conclusions from the case you state.

Q. Now, then, eliminate everything from those rivers, all deposits of every character, from the water of those rivers, save the sewage discharges of the cities upon the rivers, 7205 what would you say as to those results?

A. I would say exactly the same thing as I have said, there is nothing more could be said. My answer covered just such a case.

Q. Even if you eliminate everything except the sewage from the water?

A. Yes, sir.

Q. The result would be the same?

A. Yes, you might have just such a condition, because the products of decomposition of sewage in some stage, may bring about a large growth of water plants which dying off in the presence of nitrates,—products of oxidation, would lead to a reduction of these nitrates and a reduction of nitrites. That is the case any way you look at it.

Q. Now, then, you have stated what might be the result. State, Professor, what would be the most likely result?

A. What I have stated is as likely as any. As we know, it has been shown frequently that nitrates are so reduced that the result I have given is as likely as any other result.

Q. You cannot tell whether the sewage discharge, irrespective of the cities upon the two rivers, would have any effect upon those, or not?

7206 A. No, we have two different conditions of oxidation. We do not know whether the condition is one of advanced oxidation, or a retrograde change of reduction.

Q. Suppose, Professor, the nitrites were accompanying very high free ammonia, what would you say as to the character of the pollution?

A. Well, when the nitrites were accompanied by free ammonia, it might still just as well follow, too, that we have a reduction of nitrates to nitrites in the presence of organic matter. The presence of free ammonia wouldn't interfere with that fact at all.

Q. Then if I understand you correctly, it is as liable to come from one source as another?

A. Yes, as far as we know, it is.

Q. And the fact that the river contains, situated upon its banks, a large and populous city of 1,500,000 people would have some effect naturally on those results?

A. Certainly, in the way of discharging sewage from such a large population. In general, that large amount of nitrogen would bring about the conditions which would give rise to those products of nitrogenous decomposition. The larger the amount of nitrogen present, the larger the amount of various decomposition products we would naturally expect.

7207 Q. Isn't it reasonable to expect from a scientific standpoint that as the population increases, as the sewage discharge from the city increases, that these particular properties will increase and be shown in the chemical analyses?

A. It would necessarily follow that there must be an increase in the preducts of carbon dioxide in the various amido and aromatic compounds, in the ammonia produced and in the nitrates produced, but of the subsequent reactions between these things themselves, it would be very difficult to say very much from the present state of our knowledge of just how those changes were all brought about.

Q. Isn't it natural for scientists to expect large results in these different properties and forms of nitrites or nitrogen coming from the sewage of a large and populous city?

A. Yes, a very large protein discharge from any source; from such a discharge we would naturally expect correspondingly large amounts of nitrates, whether it be from a city or from a distillery or a cattle shed. Such as, for example, are in the city of Peoria in the state of Illinois.

Q. Professor, do not nitrites and free ammonia as a rule run higher in the Illinois river at its mouth than they do in the Missouri river and the Mississippi river?

A. I believe they do.

7208 Q. Now, if this be true, doesn't it show that the Illinois river is more polluted than the other streams?

A. Not necessarily, because the pollution is measured by many factors in addition to those. If it was measured by those alone I would say "Yes," but inasmuch as pollution is measured by a great many factors, I could not so conclude from your question.

Q. Are they not the best measures of recent sewage pollution in water?

A. Well, free ammonia is considered as a measure of sewage pollution, but nitrites absolutely not. As it has been shown so conclusively by the investigations of agriculturalists that nitrites can come just as well from the reduction of nitrates, as from any other source.

Q. Now, Professor, speaking of free ammonia and assuming that it is indicative of organic matter of animal origin, give me the average amount of free ammonia disclosed by your analyses at Grafton of the Illinois river for the year 1900?

A. For the summer of 1900 we have left at Grafton in the Illinois river an amount of free ammonia measured by .07.

Q. Now, then, I will ask you to read the average for free ammonia at that place in 1901?

7209 A. In 1901, through the late season, the summer, fall and early winter season, we have .238.

Q. Now, how as to 1902?

A. During the spring of 1902, we have left free ammonia at Grafton, an amount measured by 1.344.

Q. Now, Professor, assuming that free ammonia is indicative of organic matter of animal origin, that is sewage, I will ask you to state if those figures that you have just read do not show that the Illinois river contained less contamination and sewage pollution in 1900 than in 1902

A. If, as assumed by the question, the only indication of organic pollution is that of free ammonia, then I should answer affirmatively, that the Illinois river in 1902 in the winter, appears to be more contaminated than in the summer of 1900, but as we have other measures of organic polution besides free ammonia, it would be necessary to consider them before drawing a final conclusion for the whole case.

Q. I will ask you, Professor, if your nitrites do not increase for the year 1901 over those of 1900?

A. Well, if the table says so, they did.

Q. Well, it don't say so.

(Question repeated.)

A. Well, there isn't much difference anyway.

Q. There is a little increase, isn't there?

7210 A. There is a trifle.

Q. Professor, what is the significance in free ammonia during these respective periods at Grafton?

A. That I am not fully able to explain just what condition obtained in the Illinois river in the summer of 1901 and the summer and fall as compared with the season of 1900, to give rise to this increase of free ammonia in the second year. I could not tell. Whether it is an increased flow of pollution with nitrogenous wastes from the distilleries of Peoria and the cattle sheds of Peoria, or from some other cause, I could not state. The large amount of free ammonia in the spring of 1902 indicates a lower degree, of course, of oxidation; that we would naturally expect from the colder season. Whether this is due to the great increase of material at Peoria I have no means of knowing, as I made no determination of Peoria at a corresponding time.

Q. Assume, Professor, that the deposits from the cattle sheds and distilleries of Peoria actually decreased during the years 1900, 1901 and 1902, what would you say?

A. I would say then in general, and that is as much as can be said, that the oxidation of this factor is not as far advanced as in the other seasons. That the breaking down of the proteid from the more complex stage, or the breaking down of the 7211 nitrogenous matter from the complex proteid stage, has apparently gone practically as far, but the oxidation of the ammonia as one of the products of this decomposition has for some reason been delayed, why, I don't know.

Q. Then, Professor, from your last answer I take it that no correct analyses could be made upon which a credible opinion could be based unless the analyses be taken from one end of the year to the other?

A. No, that doesn't follow. A credible opinion is an opinion which can be believed, and I insist that the opinion I have given can be believed as much for these analyses as for any other.

Q. So that the opinion that you have given from the analyses that you have made, represents correctly the conditions of the river at Grafton at all times of the year?

A. I believe the analyses which I have presented do represent those conditions.

Q. Now, Professor, assume that for the next ten years there shall be the same ratio of increase in free ammonia at Grafton, as there is disclosed from the samples analyzed by you from that point for the years 1900, 1901 and 1902, what would you say as to the character of that water?

7212 A. If for some reason not suggested by the question there should be a corresponding increase of free ammonia, I should think something had struck the mouth of the river.

Q. The mouth, or the source?

A. The mouth.

7213 Q. Well, with the water flowing down the river, would you say that the mouth of the river was struck from the direction of its source, or from the direction opposite its mouth?

A. Well, with the water flowing down the river I should say simply that someone must have dumped some dead hogs into the river to produce such results.

Q. Assuming that no such temporary and continuous actions of that character were brought about?

A. Then it would be impossible to answer the question as such an increase as was assumed has never been observed through a period of ten years and could not take place.

Q. Assuming that the city of Chicago would grow of sufficient size and proportion from the standpoint of population, that its sewage discharged into the canal and thence into the Illinois river, so as to produce this same ratio of increase in free ammonia in Grafton, what would you say as to the result?

A. I would say it was a very bad water to show such an increase in the amount of ammonia.

Q. Is it a fact with the rapidity of oxidation, the impurities in the water decrease rapidly as the proportion of impurity is smaller?

A. That rate would be measured in various ways. In a highly contaminated water, the initial rate of change is greater than in the less contaminated water.

7214 Q. Now, then, if that be true, doesn't this show, or doesn't that show that it takes longer to oxidize the sewage of Chicago since the drainage canal was opened, than it did before?

A. No, it wouldn't follow from that at all.

Q. Why not?

A. Well, the statement I have just made refers to the initial rate of change in sewage of a very concentrated and highly contaminated condition, and the rapid beginning rate of change which is followed up more slowly later. Now, there is nothing to show that the rate doesn't continue afterwards as rapidly in one case as in another.

Q. I will ask you, Professor, if the opening of the canal and the discharge of the water into the lake from the Illinois river has not carried the sewage of the Illinois river including the sewage from Chicago, farther down the river before it becomes oxidized than it was prior to the opening of that canal, or than it did prior to the opening of the canal?

A. Yes, I believe that in a general way this period of beginning oxidation has been somewhat retarded, how much I don't know.

Adjourned until 10:00 a. m., October 1st, 1903.

10:00 A. M., Thursday, October 1st, 1903.

7215 Continuation pursuant to adjournment.

Present, the Commissioner and same counsel representing the respective parties.

PROF. JOHN H. LONG,

resumed the stand for further cross-examination by Mr. Jeffries and testified as follows:

Q. Professor, did you make an extended analysis of the Mississippi river water near the city of St. Louis?

A. I made at one time an examination of the Mississippi river water above Grafton, and that is the only examination of the Mississippi river water I made.

Q. To what extent was that examination made?

A. The results of the analyses have been given in evidence.

Q. Yes, but I mean with reference to the duration of the examination and the number of samples examined?

A. That examination was made in the fall—late fall and early winter of 1901, and spring of 1902. The examinations were in the fall, probably 25 to 30, and in the spring about ten—ten or twelve.

7216 Q. Now, professor, suppose that you had made a series of analyses of water on both sides of the Mississippi river at St. Louis, for a long period of time, and that you had found that organic nitrogen in its different forms invariably ran so much higher on the Illinois shore than on the Missouri shore, and suppose further that you had also made analyses of the water of the Mississippi at a point above Alton, and of the water of the Missouri river above its mouth, for a long period of time, and had found that organic nitrogen always ran higher in the Mississippi than in the Missouri, and suppose that you had also made analyses of the Illinois at Grafton, and of the Mississippi above Grafton, and had found that as a rule organic nitrogen in its various forms was higher in the Illinois than in the Mississippi, what would you say as to the effect of the Illinois river upon the water of the Mississippi at St. Louis?

MR. TODD: I object to the question on the ground that the facts predicated in the hypothetical question are not based upon the evidence offered by this witness on direct.

A. If I had ever made such analyses and had obtained such results, I should of course be obliged to attribute the high nitrogen in the Mississippi to the Illinois, but I do not believe that such results are found or ever have been found in any such examination in any given period of time.

Q. Professor, would it not follow from these conditions that the Illinois river was the source of very much higher
7217 organic nitrogen which found its way into the Mississippi, and down the river to St. Louis?

A. If, as I said, before, I should observe such conditions, I should then be obliged to admit or to consider that the Illinois river was the source of high organic nitrogen, but I have never observed any such condition.

Q. Professor, eliminating all other sources of pollution of the Illinois river save that caused by the sewage of Chicago flowing through the canal and down that river, what would you say of the sanitary condition of the water at the mouth of the river, if you found that it disclosed large quantities of organic nitrogen at that point?

A. If I found that it disclosed large quantities of organic nitrogen, in excess of that found in the tributaries of the Illinois, flowing through farm lands, tributaries not contaminated to any large extent by household drainage or sewage; then I should say that the organic nitrogen starting from Chicago had not been completely decomposed, but as a matter of fact at the mouth of the Illinois we do not find any such condition, even with everything which is added. At the mouth of the Illinois the condition reached, considering all circumstances, is so close to that found in the tributaries, that the supposition made is impossible.

7218 Q. Now do you mean by that answer all constituents of the water as found at the mouth of the river during the flood times, freshets, and winter season and during the conditions of the weather throughout the entire year?

A. I mean to say that at the mouth of the Illinois river during flood times; times of high water, because of the spread of this water over enormously great area, the fraction of contamination starting from Chicago has been so far reduced by this dilution that any effect which it might have in retarding oxidation is fully counterbalanced by the enormously greater dilution; and that condition of the Illinois river so far as the original sewage is concerned, I believe, is no worse then than at any other time.

Q. Now, professor, assuming that the low lands along the

Illinois river which you speak of as being flooded in high water times, was levied so that there would be no overflow of any considerable moment, what effect would that have?

A. Well, if we can assume that the land is so much levied that there is no overflow, then conditions would be changed, and we would find a different result; but as a matter of fact the levees are practically always overflowed in floods and high waters, and have been for years.

Q. Now professor, during these flood times, wouldn't
7219 there be a very rapid channel and wouldn't this organic matter be carried from the source of pollution to the mouth of the river much more rapidly than during the low stages, or ordinary stages of the water?

A. An answer to that is included in my former answer, that while because of the greater rapidity of flow, there may be some—there is naturally a more rapid carrying of the substances, because of the very great dilution that takes place—at the same time the distribution of this substance over an enormously great area, more than counterbalances that effect.

Q. Have you made any determinations on that proposition?

A. No sir, but I am basing my opinion there on the numerous examinations of the Illinois river, and consultations with the engineers regarding the extent of the overflow and the volume of water scattered over the land, as compared with that left in the channel, and which opinions of competent engineers place the fraction of drainage canal water in these overflows as but a minute portion of the whole volume of water flowing. This matter will be testified to by those who have made the calculations and the exact observations. Not being a hydraulic engineer I do not care to go into details, but the facts are known.

MR. TODD: All those facts will be brought out by men competent to testify on them.

7220 Q. MR. JEFFRIES: Then so far as you are concerned, you are basing your opinion upon speculation and upon the opinions of others?

A. I should not be willing to admit that that opinion is based on speculation, but upon the very careful measurements made by men who are quite competent to make such measurements.

Q. It is not based upon any experiment or examination that you have made yourself?

A. That particular part of it is not.

Q. Now then, have you made any examination with reference to the winter conditions in the ice?

A. I have made only the one set of examinations in the cold weather, and it has been put in evidence in this case already.

Q. Professor, suppose that the Illinois river should be frozen over in the winter time near its source, and that in the spring time when the ice broke up that this ice was carried down for ten or fifteen days, I will ask you to state what chemical changes would take place in the chemical constituents of the water so frozen during its journey?

MR. TODD: I would like to ask if the question refers to the water or the ice?

(Question read)

MR. JEFFRIES: It speaks for itself.

7221 A. Well, I am not able to answer that question in all minute details because I have never observed, and do not know of such a condition obtaining in the Illinois river throughout; but as far as I am able to judge from the analyses made, which were certainly made at a time when the conditions were very unfavorable to what we call oxidation, it is evident that the organic condition of the river at its mouth is not essentially a bad condition, as measured by the albuminoid ammonia left, and especially as measured by those chemical bacterial elements which I have explained already, that are important in giving a clew to what is left and what is going on in a river of this kind; and furthermore, the river at this time does not differ greatly, if at all, from the ordinary tributaries carrying water of purely vegetable origin.

Q. Now, professor, in determining the aggregate amount of pollution flowing into the Mississippi river from the Illinois at Grafton, would you not consider the quantity?

A. What do you mean by the quantity?

Q. The quantity of pollution.

A. The total pollution?

Q. The total pollution?

A. Total weight in the whole river?

Q. Yes?

7222 A. No sir, the total weight of the pollution in any large volume of water is the least important factor to be considered. If we consider the whole weight of common salt for example, in Lake Michigan, you would have enough there to poison an army; but in drinking Lake Michigan water we are not concerned with the total amount of salt present, but only the small amount of it which is contained in the water we work with. So in the Illinois river we do not care, nor should anybody care what the total amount of pollution is. We are practically concerned there, and in every other case only with that part which is contained in a given volume.

Q. Would you take into consideration the increased volume of flow in the river?

A. The increased volume of flow in the river is a very important element,—any dilution of the total contamination. The increased flow in the Illinois river will put a volume of water down there ten times,—yes,—near twenty times the volume of water which was discharged through the original Illinois and Michigan canal. With a dilution of twenty times, and no possible increase of contamination beyond perhaps fifty per cent., it is prefectly preposterous to think that there should be a larger amount of organic matter from Chicago in a given volume 7223 reaching the mouth of the Illinois river under such conditions.

Q. Now then in that answer have you taken into consideration the condition of the Illinois river as it existed prior to the opening of the canal and the condition of that river as it has existed since the opening of the canal?

A. Most certainly. I have been familiar with the Illinois river for eighteen years.

Q. That is not the question. Have you taken into consideration this fact?

A. I have, certainly.

Q. In what way have you?

A. I have compared the volume of flow in the Illinois river before the canal was opened, with the volume after the canal was opened, the amount of sewage going into the canal, in the old Illinois and Michigan canal, with the maximum amount which can go into the canal when the proper sewage connections are made in Chicago.

Q. Now I will ask you if it is not a fact during a great part of the year, the Illinois river prior to the opening of the canal from source to mouth, was a sluggish river, with very little current, and at times practically no current, and I will ask you to state what effect that slack in the current had upon the water in that river so far as its chemical constituents
7224 are concerned?

A. Frequently in the Illinois river, before the opening of the canal it is a fact that the water was low. At times it was very low; but in those times, however, the Illinois river water received from a source outside of Chicago a very much greater portion of—or a somewhat greater portion of contamination than it does at the present time. The increase of water in the Illinois river has not carried any corresponding increase of contamination from Chicago at all. This increase of water has not been sufficient to impede in any material way, the rate of destruction of organic matter. As a matter of fact we find today at the mouth of the Illinois river in general a better organic condition than was found before the opening of the canal.

Q. I want to know professor, what effect did that slack water and the condition of the river with practically no current during the greater part of the year, have upon the sanitary condition of that water with reference to the action of the chemical constituents in the water?

MR. TODD: At what period?

MR. JEFFRIES: Prior to the opening of the canal.

A. For that I will simply refer to the record which I have already presented. I will say briefly, that the results—
7225 the condition of the Illinois river after the opening of the canal, is also given. I will state again, that the condition in general, after the opening of the canal, is better than it was before the opening of the canal.

Q. Now professor, as a chemical sanitarian, I want you to state what effect the condition of that water prior to the opening of the canal, had upon the chemical action in the water?

A. Well, I would like to have that question read to see what it means. I am not quite clear on it.

(Question read)

A. That does not mean anything. I cannot answer it.

Q. I will ask you professor, if the water of the Illinois river prior to the opening of the Chicago drainage canal was in any better condition for the purposes of sedimentation, aeration, oxidation and the breaking up of the solid matters, than the Illinois river is during flood time, since the opening of the canal?

A. In answer to that question I will say, as determined by my investigations, that the condition of the Illinois river at its mouth after the opening of the canal is very much better than it was before the opening of the canal. It is evident from this fact that the conditions for the destruction, elimination, and reduction of organic matters must therefore be better now than they were in 1899.

7226 Q. Now professor, with a slow current, with practically no current at times, with the life period of all bacteria limited, with the period of the breaking up of the solid parts in water limited, I will ask you if it is not more reasonable to believe and if it is not according to the experience of scientists, upon the subject, that the solid matters and the decomposing matter that came from the source of the river prior to the opening of the canal, was more readily removed before it reached Grafton than it has been since?

MR. TODD: I want to object to that question on the ground that it assumes that the conditions in the Illinois river prior to the opening of the canal and that the life period of all bacteria was limited, and that fact has not been established by any evidence in this case on either side, as to the limitations of the life of bacteria.

A. In answer to that question I will say that I base my conclusions simply on the record. I cannot go behind that, the record shows the reverse of what you assume in your question.

Q. Why is it, profesor, that when the last question was put to you that you confined yourself to the chemical analyses that you made, when you testified as to the condition of the water at Grafton—you say that you took into consideration the volume of flow, winter conditions, summer conditions, 7227 flood times, and the character of the soil, the flow of the water, the volume of the water and population and other conditions?

A. Well that can be very easily answered in the same way. I base my conclusions on various things, and very largely on this record which has been presented. The record shows the fact, I have given the fact, and that is as far as I can go. I cannot enter into any explanation of why this and that thing is not otherwise.

Q. Assuming, professor, that it required twenty days for the water in the Illinois river to run from its source to its mouth, prior to the opening of the canal, and that it requires ten days since the opening of the canal, I would like to ask you what effect this time limit has upon the determination of whether or not decomposition has more rapidly taken place during the previous period than the subsequent period?

MR TODD: I object to that question on the ground that in assuming the time limit the volume of water is not included; whether this time limit is at high flood times, or at low water stages, and for that reason I consider the question improper, and I object in addition on the ground that there is no evidence upon which to base the hypothesis that it took 20 days prior to the opening of the drainage canal.

7228 A. Now before I try to answer that, I would like to have it talked over to me a little slow again. It is not quite clear to me.

Q. (Question repeated.)

A. This time limit can have no possible bearing on the question of the determination of the fact whether the decomposition has taken place more rapidly or not.

Q. Why not?

A. The chemical analysis is made irrespective of the rapidity with which the water comes down there.

Q. I will ask you, professor, as a sanitary chemist, if sewage thrown into water discharged into running water is not more dangerous for domestic purposes when the water into which it is thrown gets to a given point in ten days than it is when it gets to that same point in twenty days?

A. With all the conditions I stated, it would be very difficult to answer that question; but supposing this more rapid flow is due to enormously greater dilution, instead of being more dangerous for household consumption, inasmuch as we are concerned only with a small volume—with the small volume of water which we use for practical purposes, and not with the gross condition, the final condition, instead of being worse may be better, as far as household use is concerned.

7229 Q. Yes, but professor, do you say that by the dilution whatever bacteria or germs that may have been contained in that sewage and follow the river from the place of discharge to the given point mentioned in the previous question, are not present?

MR. TODD: I object to the question on the ground that the witness has repeatedly claimed that he was not a bacteriologist, but was testifying as a chemist.

Q. I will change the question so that the word "harmful ingredients" may take the place of the word "bacteria."

(Question read as corrected.)

A. No, I will not say that they are not present. I simply stated that the effect of any harmful ingredient is proportional to the amount of that ingredient.

Q. Then dilution does not destroy?

A. Dilution does not necessarily destroy, but it renders less probable an effect in proportion to the extent of the dilution. The effect diminishes as the dilution increases.

Q. The probability of effect diminishes, you mean?

A. Well, based on all my experience, that is a fact.

Q. Now then, professor, what effect have you given dilution in your opinion expressed upon the condition of the water of the Mississippi and the Missouri river?

7230 A. I have considered these waters in comparison with each other, based on the composition in the same number of parts in comparable parts, in parts per million, and the question of dilution in making that comparison, does not come in at all.

Q. So that you have not considered the question of dilution in expressing your opinion?

A. I have not compared the gross pollution of the Missouri with the Mississippi, or the gross pollution of the Illinois with the Mississippi. I say that for all practical purposes, for the purposes of household use, such a comparison is absolutely valueless and absurd.

Q. But in expressing your opinion upon the sanitary condition of the water of the Missouri river alone, regardless of the condition of the Mississippi or the Illinois, have you given the question of dilution any consideration whatever?

A. I have recognized the fact that the Missouri river carries a large volume of water. I have not been called upon to in any way consider what that volume of water is.

Q. But, professor, you gave an opinion as to the sanitary condition of the water of the Missouri river. Now I want to know whether or not you considered the question of dilution in passing upon the condition of that water. Yes or no?

7231 MR. TODD: I submit that he can answer the question any way he wants to.

A. In the very narrow and utterly unfair sense in which this question is put, I will say I did not consider that dilution.

Q. Now professor, I would like to ask you to state in this record wherein the question is unfair.

A. As I have stated myself several times, the only practical problem we are concerned with in considering waters, is not the gross pollution in any large amount, as a lake, sea or the ocean, but the pollution appearing in a given volume. It makes no difference what the volume of the Mississippi river is, or the volume of the Missouri, or the volume of the Illinois, or the volume of Lake Michigan. The chemist is concerned therefore only with that amount which one is liable to come practically in contact with in his daily usage as drinking water or for household purposes, and parts per million or grains per gallon or any other unit per given volume is the only thing which a practical man has to take into consideration at all.

Q. Now professor, if you did not take into consideration the question of dilution, and if, as you have previously stated, the chemical analysis can be relied upon with any degree 7232 of certainty in determining the sanitary condition of water, I would like for you to state if it would not be necessary for you to take into consideration the question of dilution?

A. Inasmuch as the question assumes something which I never stated, I would have to have it put in different form before I could answer it.

Q. Then I will ask you if it is not a fact that you can or you cannot determine strictly from your chemical analyses of the water the sanitary condition of that water?

A. I have not attempted to determine in all cases from chemical analyses alone—the sanitary condition. I believe no chemist would make as broad a claim as that.

Q. Then professor, in determining the sanitary condition of any given quantity of water, which you have just explained, regardless of the volume of the water, regardless of the dilution, how do you arrive at a correct conclusion as to the sanitary condition of that water?

A. In expressing results in parts per million, dilution is a factor that goes in; volume as compared with the amount of stuff present. The dilution factor enters right into that opinion every time it is given.

7233 Q. Now then, professor, I will ask you if in addition to the dilution and in order to determine the per cent or the amount of dilution, it is not necessary to take into consideration the amount of harmful matter or objectionable matter that is deposited into that water?

A. That is a very important fact always, in reaching any conclusion, and that appears of course, in the examination of water, in some course of the examination.

Q. Now professor, in determining the sanitary condition of the water of the Missouri river, have you taken into consideration the sewage discharges into that river, and if you have what effect has dilution had upon the sanitary condition of that water in connection with the population the sewage from which is drained into the river?

A. I have not made any examination of the sewage discharges of Kansas City, or Lawrence, or Topeka, or Manhattan or Junction City, or Council Bluffs, or Omaha, or Sioux City—in fact the whole drainage of the great Missouri valley with its tributaries entering into the river. I do not know what it amounts to, but it is unquestionably large. As I made no such examinations, in giving my opinion as to the pollution of the Missouri river in parts per million, of course I have never considered the amount of sewage flowing in. It would not be necessary to consider. I know it is there; I have no means of knowing how much it is.

7234 Q. Now professor, coming back to the Illinois river, are your calculations of dilution based upon the information that you obtained from the sample of water that you have analyzed alone, or is that information obtained from your knowledge of the actual amount of water that passes into the river?

A. My opinion regarding the Illinois river is based on my experience as an analyst. It is based further on my experience as a pretty close observer, extending back through a period of eighteen or twenty years.

Q. I insist on your answering the question.

A. I will answer it as near as I can.

Q. (Question repeated.)

A. I submit I have given a very good answer to that question.

JUDGE SPRINGER: I think the record shows that.

Q. Do those observations go to the volume of water that is discharged into the river, and do you consider that as a factor in determining the dilution of that water?

A. Why that of course is a necessary factor. The dilution depends on the volume of the water. I have kept tab on that for a long time, as close as any man in Chicago.

Q. But when you come to analyze the water of the Missouri river, you are in total daarkness as to the volume of water?

7235 A. As far as making an analysis is concerned, the question of volume does not enter at all. The analyst does not consider that in making an analysis.

Q. Well, how as to determining the dilution?

A. I have not attempted to determine the dilution in the Missouri river. I must repeat, as I have said probably twenty times in this record, that in expressing any opinion on the Missouri river, or on the Mississippi, or on the Illinois river, my reports here are based solely on parts per million of the contamination in a given volume and nothing else, and that is the only way in which a sanitarian can express his result. It is the only practical consideration with which the consumer of the water is concerned. He does not care how many tons of organic nitrogen, whether there are hundreds of tons or whether there are thousands of tons there, either in Lake Michigan or any other stream. He is concerned practically only with a small amount—the organic nitrogen which he comes in contact with when he drinks a cup of water or a cup of coffee, or when he comes in contact with this water through the way in which it has been used in washing dishes, or in preparing food. It is not the gross amount of stuff in the lake or the river, but it is only the practical small volume which he actually deals with which concerns him in any way, practically.

7236 Q. Now then, professor, if that was true, why is it that you state that no sanitarian can give a correct opinion or pass competent judgment upon the sanitary condition of water from the chemical analyses alone?

A. I think if I put the statement in that way, that I must have been dreaming. I don't believe I made any such a broad statement to cover all possible cases, because there are a great many cases in which the chemist, from his chemical examination alone can say that a water is absolutely unfit for use. He doesn't care where it has been or where it comes from, but in other cases, where the evidence is not so pronounced, or tangible, before coming to a conclusion it is a very good thing to know all the circumstances surrounding the history of the water, and that is the careful analyst who, before venturing on an opinion in a case which on its face is not very plain, who looks into these matters.

Q. Then it is or is not absolutely essential that he shall have additional information other than that which he derives directly from the sample of the water that he analyzes?

A. No, I have just explained—not always absolutely essential. I say it is a good thing when he knows it. Sometimes with more information he gets on better. I always want all the information I can get before giving an opinion.

7237 Q. Then your opinion is that the sanitary condition of water can be determined by chemical analyses of that water, regardless of source of pollution or drainage territory of that river?

A. In numerous cases, decidedly, decidedly.

Q. Give some example of cases where that can be done?

A. Well, if I should be sent a jug of water taken up from the river at Joliet, and analyzed it, I could determine in one-twenty-fifth of a second that that was pretty poor stuff to use. I would not recommend it for household use.

Q. Now suppose you would have been sent a sample of the Mississippi river water at St. Louis, without knowing where it came from?

A. If I were to be sent a sample of water from the Mississippi or the Missouri, without knowing anything further, I should not be inclined to give a very definite opinion on the results of one examination, and should not.

Q. Do you make any distinction in your testimony, professor, with reference to the particular sample of water that you examine being in a sanitary condition, and the water of the river from which that sample was taken, and what relationship do they bear to each other in passing judgment upon the water?

7238 A. Well, I assume in such a case that the sample of water which is sent to me is a representative of the water as it exists in the river.

Q. Then if that be true, why can't you determine from the chemical analyses the condition of the water without any further information on the subject?

A. Because there are a great many intermediate cases, as I said, where the evidence in any kind of an examination is doubtful—somewhere between the upper limits and lower limits, and it is very hard to say where we step from one territory over into the other. If in addition to my chemical analyses I find in that Mississippi river water, that there are no fermentation elements there; nothing which would bring about putrefaction or fermentation, I have the further suggested evidence that the water probably contains no harmful substances, and if I find many of those elements there, I should be inclined to be suspicious about that water, thinking that along with these peculiar living forms, there may be others, or that others may have come in at the same time, of more harmful character.

Q. Supposing a sample of water should be sent to you for analysis, with the statement that it came from water which flowed through no natural salt beds, the soil of which 7239 was not of a saline character, and that the sample so analyzed would disclose from 12 to 15 parts per million of chlorine, what would you say as to the condition of that water?

A. Well, I would say it contained so much salt.

Q. And that is all there would be to it?

A. There would be no question. That is all I could say.

Q. Would you be able to express any opinio as to the source of that salt?

A. Not an absolutely definite opinion, but I should be inclined to think that it had been exposed to some organic contamination somewhere, if all of the assumptions in the question were correct—that the water has not been able to take up salt from any other source.

Q. However, the presence of the chlorine does not imply the absence of deleterious matter, does it?

A. No, not necessarily. Of course it could not have any such bearing.

Q. Professor, I suppose you will admit that the water that passes through the canal and enters the Illinois river at its source, reaches the Mississippi river at the chain of rocks?

A. Yes I suppose most of it does.

Q. Subject of course to evaporation and absorption?

A. Yes.

7240 Q. And when that water reaches there it is necessarily diluted?

A. Yes.

Q. From your chemical analyses are you able to determine the substance with which it is diluted and the source of that substance?

A. Not absolutely.

Q. I will ask you professor, what particular constituents of the sewage of Chicago would remain with that water in its journey down the Illinois river to the chain of rocks?

A. There are in general, the constituents which we term the mineral or inorganic; they are the only ones of which we can say with certainty, that they must remain largely, or in the main. Of these it is perhaps safe to say that some changes would also take place by what we call double decomposition in the river. To illustrate: while the sodium chloride may pass down practically unchanged, in the processes of oxidation going on in the river, in which acids are liberated, it is altogether likely that carbonates originally present are more or less modified, and changed into other salts, so we cannot say with absolute definiteness that even these mineral substances pass from the source to any given point. They doubtless undergo some changes on the way. Now as regards the
7241 organic substances, these are the bodies in which the
most pronounced changes take place, while the mineral substances suffer little or no alteration or decomposition. The organic bodies are those on which the bacterial destructive processes are carried out. These are the substances which are changed and altered and in many cases absolutely destroyed—worked into bodies bearing little or no relation to the original substances.

Q. Now the processes which you have spoken of simply change the form of the organic matter, but it is still there?

A. No, they change the form and they change profoundly the character of the organic matter. Organic matter is a term including a great variety of substances. The original organic substances entering waters as sewage or other drainage are comparatively complex and these break down into substances gradually which are comparatively simple in their composition.

Q. There would still be a residue, wouldn't there, from the sewage of Chicago remaining in the water?

A. I think beyond question there must be some organic substances of stable type which remain for long periods unchanged in natural waters. What these are it would be very difficult to say.

Q. Your chemical analyses do not show?

A. No attempt is made in our general chemical analysis to determine the exact nature of these residual products of organic destruction.

7242 Q. Can you determine whether they are living or dead organic matter?

A. From the chemical analysis alone, as I think I explained a few days ago, we cannot determine that. But the so-called bacterial chemical test would give us an indication of the presence of living substances.

Q. Then there is certain stability of organic impurity in the water at Grafton?

A. In general, organic substances undergoing decomposition, are not completely reduced to the elements of carbon, hydrogen and oxygen. It is undoubtedly true that types of extremely stable bodies are finally reached in the decomposition of protein matters. It is well known that the bodies of the so-called aromatic group, ring structure compounds as we call them, are remarkably stable. Now as these bodies are found in the water, we are practically unable to determine their ultimate fate. I think these substances are concerned in forming organic sludges which accumulate in rivers and on the bed of the ocean and in time they serve, or have aided in the formation of coal and oil deposits.

Q. Now these statements you have made are purely speculative and do not rest on any actual results from your analyses of the water?

7243 A. Not from my own analyses, no indeed. Those statements depend on the investigations of men that have been carried out through many years. The residues or sludges from beds of rivers have shown these aromatic compounds from which peculiar hydrocarbons may be distilled. I have not made them.

Q. Now the organic matter and the residue may be a part of the sewage pollution of Chicago and it may not. In other words that question is inderterminable by you?

A. As a matter of fact I suppose in the breaking down of protein molecules, for example, discharged into a river, there are residues left, possibly, even probably at the mouth of the Mississippi river, residues of stable character which at one time were component parts of these very complex molecules. These original substances have, as compared with the final products a complexity, which may be roughly expressed by the ratio of fifteen or sixteen thousand to a hundred or less; that is the decomposition of the protein substances leaves finally these aromatic residues which I spoke of, going so far as to break down the enormously great groups of which we know that protein molecules consist, to residues of that relative minuteness.

Q. Then if I understand you correctly it is possible that
7244 some of the residue and bacteria from Chicago deposited
in the Illinois river, remain with that water until it reaches the chain of rocks?

A. You have involved two assumptions in your question which do not at all go together. While it is possible that the ring structure residues may remain, which bodies are of a remarkable stable character, it would not follow that bacteria leaving Chicago would exist one-one-hundredth of the time or distance.

Q. Now then, how do you know that they would not, and will you please separate them?

A. These organic substances are different in general from the bacteria which we class as organized substance. These true organic substances which are products of protein decomposition are universally recognized by chemists as bodies of immensely great stability. On the other hand, the living organisms or organized structures as distinguished from the organic structures, are universally recognized as bodies of very slight stability, subject to change by the action of all kinds of agencies. I think while it may be true that one of these stable products might survive the journey from Chicago to St. Louis, or to New Orleans even, it would not even remotely follow that there would be any reason at all for supposing that a highly unstable,
organized bacterium would survive the same journey;
7245 the bodies are so unlike that it would be unsafe to draw
a conclusion from the life of one as to the existence of the other.

Q. Has your chamical knowledge led you to any substantial reasons why they would not follow each other?

A. Not any chemical experiments I have made, no sir.

Q. Has the stability of all characters of disease germs been determined?

MR. TODD: I object to the question as this witness has not qualified as an expert bacteriologist.

MR. JEFFRIES: I suggest that the witness has testified upon the proposition that the passage of the residue from Chicago to St. Louis does not necessarily mean that the bacteria in pollution would pass from Chicago to St. Louis.

MR. TODD: I submit that the witness has refused to testify upon that proposition, and I renew my objection that the question is not proper as the witness has not qualified as an expert in bacteriology.

MR. JEFFRIES: I suggest that the witness has qualified as a scientific chemist and as a bacteriological chemist, and that the witness has stated that there is no correct line of demarkation between bacteriological chemistry and bacteriology proper and I think I have the right to ask the question in order to determine the extent of the witness' information
7246 and learning and knowledge upon the subject.

MR. TODD: I submit that the record discloses what the witness has said.

Q. (Question repeated).

A. Not that I know of.

MR. JEFFRIES: Then why do you say that it doesn't necessarily follow that because the residue of the organic matter from Chicago reaches St. Louis, that the disease producing bacteria will not reach there also and follow this residue?

A. It would be perfectly absurd to assume that because various stable bodies can pass down the river, that the very unstable substances should likewise be able to pass down the river.

Q. Wouldn't it be as reasonable to belive that the presence of this residue and the fact that the residue has passed from Chicago to St. Louis, that in their journey they are accompanied with the dangerous living elements specific in character and which have a deleterious effect on the health of the people using the water. I suggest to the witness he may call those living elements, chemical elements or living elements

A. Well a chemist cannot call them chemical elements, because they are not. In answer to that question, it could not be said without positive knowledge of the field of pure 7247 bacteriology, which the witness declines under any circumstances to enter. That there isn't the slightest likelihood that because of the passage of these various stable residues through a long stretch of the river and that the bodies which were at one time concerned in the breaking down of the protein molecules, should follow the same course. The one set of bodies are very stable, existing under extradordinary conditions of temperature, pressure and chemical action, while the other substances are well known to succumb most readily to the slightest variations in temperature, acidity, alkalinity and alteration in the surrounding mediums.

Q. I want you to state, professor, whether or not, if you know, that such living germs or living substances, disease producing, do pass from Chicago to the intake at St. Louis. Yes or no?

A. In as much as in spite of all the investigations which have been made, no one has yet found a disease germ passing from Chicago to St. Louis, I am inclined to say that I do not believe it could pass. No I do not believe that a disease germ would pass.

Q. Do you know that they would or would not?

A. As a chemist I do not know that. I depend for this opinion upon the well known results of experiments of others.

7248 Q. Professor, why is it, in answer to these questions you rely upon your chemical analyses and chemical information, yet at the same time you believe that on account of the bacterial changes in the water that these disease producing elements or material, do not come from Chicago to St. Louis?

A. That question is not put in quite a clear form to answer, it is contradictory in itself.

Q. When you testify as a chemist and not as a bacteriologist, and profess no knowledge from the standpoint of a bacteriologist?

A. I am certainly not attempting to give testimony from the standpoint of a bacteriologist and I have been careful to state where I have ventured an opinion on that line, that I am using the information and experience of others.

Q. Then, professor, you do not know that these disease producing materials or substances of a living character do not pass from Chicago to the intake of St. Louis?

A. As a chemist pure and simple, I don't know.

Q. And further than that you decline to state?

A. Well no, that is not a correct proposition.

Q. Well, do you state as a bacteriologist?

A. I do not speak as a bacteriologist, but I am very far from declining to speak on anything I know about.

7249 Q. Do you know about this, about their passing from Chicago to St. Louis?

A. I don't know. I am not aware that anyone has ever discovered their passage.

Q. And simply because they have not been discovered, you take the position they are not there?

A. In as much as through these investigations they have not been discovered, I am justified in taking the position they are not there.

Q. Professor, I will ask you this proposition: if you do not believe that in the taking of the number of samples to which you have referred, there have been as many as one typhoid bacillus discovered, if it would not have produced death and destruction to the people using that water for drinking and domestic purposes; if that proportion being maintained in the water supply of the cities usually, in the event that one typhoid fever bacillus should have been discovered during that series of investigations.

A. Not being an etiologist or a bacteriologist, I cannot answer that proposition from that professional standpoint. But from the standpoint of an educated layman, I should think the possibility or probability of death and destruction following in St. Louis, the detection of one typhoid fever bacillus
7250 is so absurd as not to be worthy of consideration.

Q. I will ask you to state the quantity of water that would be absolutely examined with a view of determining the bacteria contained in it, using one cubic centimeter of water for each test, how much or how great would the volume of water be in ten thousand tests or ten thousand cubic centimeters of water, and how does that water so examined, in volume, compare with the total volume of water flowing down the Illinois river?

A. The result is the examination for typhoid bacteria referred to here. That is the question, is it?

Q. No, I am trying to get into the absolute volume of water in pints, quarts or gallons, that would be actually examined in 10,000 examinations, using one cubic centimeter of water for each test or examination, and after that is obtained, how does that water compare with the volume of water flowing down the Illinois river?

A. Well, in answering that question, I will say that the volume of water examined to determine the number of bacteria present varies with the different observations and different locations of the water, but in the mean the number would be estimated in such places as the mouth of the Illinois river, in probably one cubic centimeter. In 10,000 such tests, then 10,000 cubic centimeters would be brought under observation.
7251 How these 10,000 cubic centimeters compare with the whole volume of the river at that point, I am not able to state now, and furthermore this is not the most important point in the question. The important point is the relation of the 10,000 cubic centimeters to the volume of water which any one person would consume; not to the volume in the rivers. As I have said, it is not the total quantity we are concerned with, but the quantity an individual uses. 10,000 cubic centimeters is a very large quantity for a consumer, and that is the point which I think we are practically concerned with, not the total volume.

Q. I want the latter part of my question answered. Assume further that these 10,000 samples were examined in the course of two years, how would the volume of water in the Illinois river compare with the quantity analyzed by these 10,000 samples of water, using one cubic centimeter for each examination?

MR. TODD: I object to the question for the reason that it is purely mathematical and not chemical and it would require the services of a hydraulic engineer rather than those of a chemist, as this witness has not testified that the has made estimates of the volume of water in the Illinois, Mississippi and

Missouri rivers for the periods covered by this question, when the 10,000 cubic centimeters of water were taken.

MR. JEFFRIES: I suggest that the witness has pre-
7252 viously stated time and again, that he is acquainted with the stream flow of the Illinois river.

A. Now in answer to the last part of the question I will say that I am unable to state exactly the relation of the 10,000 cubic centimeters to the total flow in the three rivers in question, but this much can be safely said, that the 10,000 cubic centimeters would be relatively a very minute part of the whole flow.

Q. It would be an infinitesimal part?

A. It would be an infinitesimal part of the whole flow.

Q. How many gallons would 10,000 cubic centimeters of water be?

A. Ten thousand cubic centimèters, is ten liters, and to reduce this to gallons we must divide by 3.78, I believe is the factor. It would be something like two and a half or two and three-quarter gallons.

Q. Then because a typhoid bacillus was not discovered in two and a half or two and three-quarter gallons of water taken from the river at various times and during various parts of the year you reach the conclusion that the water contains no typhoid bacilli?

MR. TODD: I object to the question, as the witness has disclaimed that he is an etiologist, bacteriologist or epi-
7253 demiologist, and has not asserted that he has arrived at any conclusion based upon any analyses made by himself, but has expressed his belief based upon the investigation of others, and not upon his own original investigation of these subjects.

MR. JEFFRIES: Counsel for complainant states that for the reasons stated in the objection of counsel for defendants, the opinion as to the water of the Illinois and Mississippi rivers, and especially the water at the intake in the Mississippi containing no disease producing elements, the opinion so expressed by the witness is ill-founded and of no value, because as stated by counsel for defendants, the witness is not possessed of sufficient scientific learning to be able to express an opinion thereon.

MR. TODD: In reply to the statement I desire to state that the statement is not based upon any statement made by counsel for complainant, and if counsel wants to have that statement stated in the record he may do so. My objection is as to the proper cross-examination of the witness upon matters which were brought out in chief and not as to the weight to be given to this witness for any opinion that he may express when requested by counsel for complainant.

MR. JEFFRIES: I again suggest that the witness qualified
as a sanitary chemist and qualified as a bacteriological
7254 chemist, and stated in his examination in chief that there
was no direct line of demarkation between bacteriological
chemistry and bacteriology proper, and therefore this testimony in addition to the reasons heretofore stated is competent to obtain the source of the witness' information, and the strength and importance that should be attached to it.

Q. (Question repeated.)

A. In answer to that question I will say that inasmuch as I have disclaimed any intention of testifying as an expert bacteriologist, and inasmuch further, as I am not perfectly familiar with the methods which bacteriologists employ in the identification of the typhoid bacterium, I am unable to give an answer to that question.

Q. Then professor, why do you state that because in your opinion no typhoid germs have been discovered in the great number of samples that have been taken, that no such germs existed in the water of the river, you not being an epidemiologist, etiologist or bacteriologist?

A. My statement of opinion was based on the experiments of others, and again from the standpoint of an intelligent layman and not a bacteriologist. That was merely a question of probability. After these thousands of examinations have been
made and none found, there was no evidence apparently,
7255 that they were there.

Q. Then your statement in that respect is not made as a scientific sanitary expert?

A. My statement in that respect is not made as a bacteriologist.

Q. Well is it made as an sanitary expert?

A. Well, that depends on who defines sanitary expert.

Q. In other words, is it not your individual opinion as a layman, as you express it?

A. Yes, I am very glad to put it that way. It is my individual opinion as a layman, that because out of these thousands of investigations, no disease germs have been found, it strikes me as highly improbable that there is any reason for assuming that they are there.

Q. Now then, as a layman, the failure to find does not necessarily mean that disease producing material was not there?

MR. TODD: I want to interpose an objection to this line of cross-examination as being improper and if counsel desires to get an opinion of the witness on any other subjects aside from that which he qualified on, he may do so.

MR. JEFFRIES: I suggest that the witness belongs to the defendants, and he voluntarily expressed his opinion in his 7256 direct examination, and expressed opinions bearing upon the matter now under discussion and we have a right to cross-examine the witness in this respect so as to determine the source of his information and the strength and importance that should be attached to it.

Q. (Question repeated) Yes or No.

A. No. As a layman it would not necessarily follow. From the standpoint of a layman it would not necessarily or absolutely follow but the layman would naturally desire some stronger proof than has yet been presented, proof that a layman can appreciate and understand if he is a man of fair intelligence.

Q. Professor ,assuming that there are billions of bacteria discharged from the sewage of Chicago into the Illinois river by means of the drainage canal, you do not take the position that it is impossible for some of them at least to reach the Mississippi river at the chain of rocks

MR. TODD: I object to the question on the ground that this witness has not qualified as a bacteriologist and has repeatedly disclaimed that he was a bacteriologist.

Q. (Continued)—limited to the bacteria that you have studied and reported upon in this testimony, and basing your judgment and knowledge upon the information which

7257 you have obtained in your scientific researches in that respect alone?

A. From my knowledge as a chemist, I would not be able to state that it is impossible.

Q. From your knowledge as a bacteriological chemist, what would you say?

A. From my knowledge as a bacteriological chemist, I would not be able to make any answer on that proposition at all. That is a question which calls for the knowledge of the expert bacteriologist.

Q. Now professor, going back to these live organic substances, following the various specific organic matter found in the waters of the Illinois river and the residue of the organic matter, I will ask you to state if it is not a fact that these small particles of injurious substances that may follow, will not more readily reach the Mississippi river at the chain of rocks from the Chicago drainage canal during high stages of the river than during low stages?

A. No, I would say, in general it does not follow for the reason already explained, that because of the character of the pollution in spreading out in the waters over land, the probability of any single thing reaching the mouth of the Illinois river from the drainage canal is correspondingly diminished.

Q. Doesn't the great dilution increase the stream flow?

7258 A. While great dilution increases the stream flow, it at the same time increases the stream expanse, covering an enormous area for sedimentation and settling and loss of organic matter.

Q. Then you take the position that all the discharge from the large canal into the Illinois river during flood times is practically separated out over a broad area of land upon the river, and that none of it follows the main channel of the river from Joliet to St. Louis?

A. I haven't taken that position. I have said that a part of it is spread out and ordinarily a very large part of it is so spread out.

Q. Now what part if it is not spread out?

A. That part of it is not spread out which remains in the channel of the river, but at the time of flood this part is but a fraction and even a very small fraction of the whole.

Q. The dilution does not mean the absence of the germ, does it, of the polluted matter?

A. No, not necessarily. The absence or the distribution of whatever matter is there through a larger volume.

Q. Now professor, wouldn't this polluting organic matter
from Chicago reach the Mississippi river at the chain of
7259 rocks more readily in the winter time than in the summer time, and in larger quantities, and have you not so stated?

A. Inasmuch as bacterial activity is less in winter than in summer time, it is altogether probable that the amount of material passing down the river in the colder season is greater than the amount passing down the river in the warmer season, how much greater I don't know.

Q. Is not oxidation retarded in the winter time as compared with the summer time?

A. Yes, the explanation of the former question depends on what is called chemical oxidation.

Q. Professor, will you please describe a septic tank and septic operation?

A. I can describe septic tank operation only in a general way. I have not testified as a sanitary engineer and do not care to go into any description.

Q. Well aside from the engineering feature altogether, as a chemist from a chemical standpoint?

A. Well that I will attempt only very briefly. In what are called septic tanks organic matters are brought or left in connection with the destructive germ agents in such a way as to bring about the breaking down or decomposition of these organic matters.

7260 Q. What are the characteristics of a septic tank exclusive of air?

A. Exclusive of air, the presence of certain bacteria.

Q. Then the exclusion of air is a vital part in connection with a septic tank?

A. In certain kinds of septic tanks I believe, yes. It depends on what the desired action is, whether it is the breaking down, destruction without air or destruction by oxidation processes from the start. As I am not practically familiar with the methods of construction and workings of all kinds of septic tanks I would not care to go further into that discussion as to how far practically the action of air is important and necessary or not important or necessary.

Q. What is the difference between septic operation and oxidation?

A. In what is generally called septic operation the process is one of disintegration or breaking down. It is very largely what chemists would describe as a process of hydrolysis. The substances undergo a change in many cases, breaking up by the combination with the elements of water, large groups breaking up in this way to form smaller groups, and by many sanitarians, or some sanitarians at any rate, I believe this breaking down operation is considered as preliminary to the oxidation
7261 processes which follow the product of the first reaction.

Q. Then septic operaton is never oxidation, or is not oxidation?

A. That I am not prepared to say absolutely, because, as I said a little while ago, I am not familiar with the methods of operation here, but I believe this is true, that certain tanks called septic tanks, or certain processes of purification which are considered in connection with septic tank processes are carried out in the presence of oxygen, or with oxygen. As I have stated, however, at the outset, this field itself is one somewhat outside of my own line of investigation. There has been enormous literature on it, and I do not pretend to be acquainted with all of the facts, as much new matter is being added all the time, to the discussion.

Q. What effect has dissolved oxygen upon septic operation?

A. I believe that point is still in dispute. I cannot state from my own experience, because I have no experience in the operation of septic tanks, but from the discussions which I have paid attention to, I believe the question of oxygen from the start, and the effect of oxygen from the start is in dispute, as regards the final work of these tanks in some cases.

Q. State, Professor, whether you know anything about septic operation of the water in sewage in the Chicago
7262 river prior to the opening of the main drainage canal?

A. Yes, I have some little knowledge perhaps, on that point. For the purpose of the comparison I have described the conditions in the Illinois river, as comparable with those conditions which obtain perhaps more or less perfectly in the operations of a septic tank; I have observed the conditions in the old canal and in the river before the canal was built, and also in Peoria above Pekin, at Wesley, and these conditions seemed to me analagous to those which would obtain in a septic tank.

Q. Now state, Professor, the particular characteristics of septic operaton that were visible at these places?

A. The operations which I have noted at those places are largely the disturbances due to the liberation of gases and in some cases I have observed also a coating or scum over the water which is described by the people who were in charge of the operation of these septic tanks as a peculiar thing very frequently noticed in them.

Q. Did you notice any bubbles in the canal?

A. I have answered that question.

Q. Was there any dissolved oxygen flowing into the Illinois and Michigan canal from the river prior to the opening of the main drainage canal?

A. I have never made any experiments to determine the dissolved oxygen. I am unable to answer that question,
7263 but they have been made by others.

Q. Did you ever notice any characteristics of septic operation in the main drainage canal?

A. No, I do not recall of ever noticing anything in the main canal of that character, before Joliet was reached, but I have observed after the opening of the canal, the same thing above Pekin.

Q. Was it due to the new or old deposits?

A. As I did not stir up the deposit, I cannot state with absolute certainty there. But from the fact that at the opening of the canal there was a very general stirring up of the old deposits, it so happened that the opening of the canal came at a time of rather high water, I believe the septic action I observed there would be compared to septic action following I think new, rather than from the old deposits.

Q. Could you have told whether the deposits were old or new, if you had dug that out and studied it?

A. It is difficult to answer that question except in a general way. There is a difference in the character of the deposits there, between the old and the new. The character of the Peoria discharge is peculiar, and it is in general not a very difficult matter to determine whether it is old or new. There is so much
7264 visible matter discharged with it, one can generally recognize what he is dealing with.

Q. Do you know, Professor, whether or not there is dissolved oxygen in the Illinois river from mouth to source and through the canal in the Desplaines river, since the opening of the canal?

A. I will not pretend to answer that from my own experience, but I will state as I have already said, that such determinations I believe, have been made and can be testified to by others.

Q. Now, I will ask you if the presence of dissolved oxygen is not necessary in the determination of, or rather the determination of the presence of dissolved oxygen is not necessary in ascertaining the sanitary condition of the water?

A. I have not considered that necessary in looking at the condition of this water in the important parts of the river above Peoria and at Peoria, Wesley, and the mouth of the Illinois river, whether there is dissolved oxygen there or not does not concern me and I have not considered it important.

Q. Therefore, you have eliminated the question of dissolved oxygen from your determination?

A. The question of dissolved oxygen is left out from my determination. I observed the important fact of a large
7265 amount of filth added at Peoria, half way down the Illinois river and it does not concern me at all, and does not enter into the problem as important, whether there is dissolved oxygen there or not.

Q. Professor, is there any element of more vital importance in determining the changes, and changing characteristics of the water in a river, in determining its sanitary condition?

A. I would not be prepared to admit that in an investigation of any kind the presence or absence of dissolved oxygen at Peoria, Wesley and the mouth of the river, cuts any figure at all.

Q. In other words, you are not prepared to speak on that subject?

A. I am not prepared to state the amount of dissolved oxygen, because as I said several times, I did not determine it, but I am glad it has been determined. In the lower part of the river I have no doubt that the testimony will show it was abundantly present.

Adjourned until 2:00 p. m., same day, Thursday, October 1st, 1903.

7266 2:00 p. m., Thursday, October 1st, 1903. Continuation pursuant to adjournment.

Present, the Commissioner and same counsel representing the respective parties.

PROF. JOHN H. LONG,

resumed the stand for further cross-examination, by Mr. Jeffries, and testified as follows:

Q. Professor, in your analyses of water in the Illinois river at Peoria, or at Wesley, did you take cross-sections of samples?

A. I did not; but in my examination of the water at Wesley, below Peoria, these precautions were taken to secure fair samples for the purpose of this investigation:

I had been pretty familiar with the situation at Peoria for some time, some years, so in 1899, when the first long series of tests was made, in company with the engineer of the State Board of Health, Mr. Jacob A. Harman of Peoria, I spent considerable time in looking at the river and determining the point at which the mixture of the cattle shed and distillery waste or discharge, with the river water, was practically complete and uniform. The point at which the samples were taken there 7267 was selected only after a very thorough examination, made from a boat. We took first a gasoline launch, with a small boat attached, and when we reached a part of the river where we wished to make the examination, I got off into that small boat and we went backwards and forwards and studied the situation, so that we decided finally on a place far enough out to secure what I considered a very fair representative sample, neither exaggerating nor diminishing the average condition of purity there.

Q. Now, is that the only manner in which you undertook to obtain a fair mixture?

A. That is the manner in which I undertook to obtain it.

Q. Now, how could you tell that you had so obtained a fair mixture in this manner?

A. At that time it was possible to observe by the general appearance of the river, how far around the bend, below and opposite Wesley, the main current extended without mixing thoroughly with the pollution; there was sufficient difference in the appearance of the water so that one could recognize by proper and sufficiently long inspection, where this mixture was practically complete.

Q. Now, during this period of 1899, when these samples were taken, state whether or not there was septic operation going on in the river there below Peoria?

7268 A. At that time there appeared to be considerable of this operation which I have described as septic. That is the liberation of more or less gases in places, from the river. There is always at Peoria, the deposition of large accumulations or large masses of stuff containing a good deal of the stable shed or barn-yard waste, of hay, as well as the slop, and this material going far enough below the bend across, from and below Wesley, becomes pretty uniformly distributed over the whole river and it was as near as possible in the center of that, between the east and the west banks, far enough down below Wesley, that the samples were taken.

Q. Did this apparent septic operation appear to be taking place near the sides of the river on the shores of the river or in the center, or was it distributed all over the surface of the river?

A. As I recall now, this action was pretty general at the point below Wesley.

Q. Was there not more septic operation visible on the Peoria shore than on the opposite shore?

A. By noting a point sufficiently up stream, that is true; that is, the septic operation began further up on the Peoria shore than on the Wesley shore, but these samples were taken a considerable distance below that point.

7269 Q. When you state that you had a fair sample of the water in the river at that point, you say so from your observation of the water at the time?

A. Yes.

Q. And not with reference to the chemical analyses which were made of the water at various places in cross-sections, across the river?

A. No, I made no cross-section there. I determined what I considered the fairest point of that inspection, and instructions were given to the collector to obtain the sample at that place.

Q. Now, how far below Peoria proper were these samples taken. In other words, I understand that they were taken at Wesley. Now, how far is Wesley from Peoria?

A. These samples were not taken really at what should be called Wesley, although that location is so described in my report. Wesley is really a point on the opposite side of the river. The collections for me were made by a collector who went from the Peoria side of the river and some considerable distance below Wesley, it would really amount to. Opposite Wesley itself, or directly out from Wesley, the mixing has not taken place at all.

Q. Now, how far below did you go?

7270 A. Below Wesley it would be probably a quarter of a mile, possibly further. I cannot really describe the exact location now.

Q. Now, Professor, if the water in the river was in such condition as to be undergoing the process of septic operation, there would be very little current in the river, would there not?

A. The current would be relatively smaller than it has been at other times, but the current is still quite perceptible, and the movement of these great masses of filth is perceptible. The masses which are locally described as floating islands there. It is quite marked.

Q. Now, this was prior to the opening of the canal, as I understand it?

A. This observation I am speaking of was in 1899, before the opening of the canal.

Q. Now, you speak of floating islands, Professor. Those formed in the river at Peoria prior to the opening of the drainage canal, did they not?

A. Yes.

Q. And it was during a time that some of these islands were being washed out or pushed out into the river that these examinations were made?

7271 A. Oh, these islands have been formed and broken up and formed and broken up through years; it was a regular phenomenon there and they have been seen since the canal was opened also, and also collected.

Q. Now, Professor, assuming that disease germs of these living organisms of the objectionable character contained in the water and this pollution that may come from Peoria or from Chicago or from any other place, has a certain life time limit, I will ask you if it is not your opinion that a great many more of those living organisms would perish in those islands lying there upon the shore of the river at Peoria prior to the opening of the canal, when since the opening of the canal, by the increased volume of water they are carried on down the river, and that those organisms would perish there at Peoria, while since the opening of the canal, if they perish, it is further on down the Illinois river?

MR. TODD: I object to the question for the reasons heretofore stated in other objections, that this witness is not an expert on bacteriology.

A. An answer to that question would involve a much greater knowledge of the fate of so-called pathogenic bacteria, and the conditions under which pathogenic bacteria are destroyed, than I,—not being a bacteriologist,—am able to furnish, but
7272 it is fair to state this, that by those who are engaged in this work the effect of a septic tank and similar operations on the pathogenic bacteria passing through them, is still in dispute. I would not therefore attempt to answer that question positively.

Q. Professor, assuming in connection with the question that has just been propounded to you, that prior to the opening of the canal this offal from the stock yards, and distilleries and cattle sheds at Peoria, formed in islands upon the banks of the river, which would remain there for a conisderable time, and afterwards were pushed out into the river either by steam-boats or by floods and freshets, in the Illinois river, if during the time that those deposits containing objectionable pollution and matter, did not gradually increase while resting there upon the shore of the river, so that after the drainage canal was open and the similar discharges cast into the Illinois river was carried at once down that river, that those germs would find their way further down the river before they perished, as a practical chemical proposition, is that not true?

MR. TODD: I object to the question for the reason that the question is not a practical chemical proposition, but taken in
connection with the previous question, is a bacteriologi-
7273 cal proposition involving questions of disease germs of
which this witness has disclaimed to be an expert in and
for that reason it is not proper cross-examination.

Q. MR. JEFFRIES: Limit it, professor, to your investigation in a bacterialogical chemical examination and experience, with the assumption that the objectionable pollution is in the shape of disease producing living organisms; what do you say upon that subject?

A. If we are limited to that assumption I will say that as a chemist and not as a bacteriologist dealing with questions of pathogenic germs, I cannot answer it. The limit goes quite beyond my powers of answering.

Q. Do you not maintain professor, that while that objectionable substance was lying upon the shore of the Illinois river at Peoria, fresh sewage being continually added to it so as to keep it in a moist condition, in a condition suitable for decomposition, that the objectionable features of that material would not disappear in part while it remained there upon the banks of the river, and that the same sewage if carried down at once—that the same deposits, if carried at once into the river and passing down the river, would carry more objectionable qualities with it, than it would if it remained on the banks of the river for
a certain length of time?

7274 A. If all the assumptions made in the question were true,
it would necessarily follow as a matter of course, that
this objectionable matter would be further carried down the river, but the assumption does not correspond to the practical case. Going back to my record, on which I must depend, my record of analyses, I find that the reverse of what has been assumed in the question is the actual situation.

Q. Professor, those samples that you have reference to were taken at one point. Now I would like to ask you what proof you have that they are representative and characteristic of the water in connection with these times that we speak of?

A. I have stated as explicitly as possible what were the directions that I gave—I first showed the collector where the samples should be taken and in addition to this, cautioned the men to collect those samples in the fairest possible manner. He was warned distinctly and implicitly against the collection of samples from near these floating islands; that they were to represent a fair average condition of that part of the river below Peoria.

Q. Professor, did you ever examine any of these islands, prior to the opening of the canal with a view of determining their chemical constituents and the chemical changes that they underwent from the time that the deposit was placed upon
7275 the banks of the river at Peoria, until they were started
floating down the Illinois river?

A. No, I have never examined the chemical composition of one of these floating islands.

Q. You know it to be a fact, do you not, professor, that since the opening of the drainage canal there has been no such islands form in the Illinois river?

A. On the contrary I have seen since the opening of the canal just such deposits.

Q. Not so many as there were prior to the opening of the canal?

A. Well I cannot say that I counted them in either case.

Q. Then professor, I will ask you this question, that if these islands have formed since the opening of the Chicago drainage canal, if the effect of the opening of the canal has not been to hasten those islands in their passage down the Illinois river to its mouth?

A. Well that is possibly true. I have no data to show anything about the rapidity with which these islands break up. I must add this, that the islands do not flow as such any very great distance down the river. The formation and breaking up of these so-called floating islands is rather a curious phenomenon, as I have seen the operation several times. They appear to break to pieces and sink and come up again and eddy

7276 about. I do not recall that I ever saw them any very considerable distance below that particular location in the river.

Q. Now I will ask you, professor, if you do not know it to be a fact that prior to the opening of the canal, upon a number of occasions, these large islands were formed upon the banks of the Illinois river, and the authorities, or the persons who were responsible for those islands employed steam-boats to pull them from the shore and start them down the Illinois river, and if since the opening of the canal no such conditions have existed?

A. Personally I am not familiar with any such condition and have no knowledge—

Q. Now then, I will ask you professor, if the cutting loose of these Peoria islands, so-called, into the Illinois river prior to the opening of the drainage canal, that river being in a septic condition as stated by you a few moments ago, if the septic operation of the water upon those islands would not have a tendency to break the islands up and break the polluted matter and the solids more rapidly than it would in a running stream?

A. The question does not distinguish between mechanical breaking up and subsequent chemical disintegration. It is probably true that a mechanical disintegration or breaking up of these islands into smaller masses, would take place more 7277 rapidly and more efficiently perhaps under the influence of the stronger current. It does not however, follow that the chemical disintegration or breaking up should be modified in the same way. There is a very important distinction between mechanical destruction of the large mass and its subsequent chemical decomposition.

Q. Professor, if it should be shown to you that a chemical analysis of the water at the points where the samples were taken by you were of different chemical constituents and in a different condition chemically in various parts of the river in cross-sections, at the time these samples were taken by you, what effect would the result of those samples have upon the conclusions drawn by you from the samples that you have taken?

A. Although that question is considerably mixed, and if I didn't know what is wanted, I would not be able to answer it, I think I can make this statement very fairly: That if I should

find, as the question assumes, that a fair cross-section set of samples was taken and showed results at the same points different from that of my sample, I should be in duty bound to think that perhaps there was some mistake made in the collection of my sample, assuming all the conditions. But if I have no such evidence that a cross-section was made at the proper
7278 point, then I would have no reason to modify in any respect the opinion which I give, based on the evidence of the analysis of the sample at the point where my directions were given to collect the sample.

Q. Professor, are you acquainted with the number of cattle that have been fed at Peoria in the last few years?

A. I have heard various statements about the number.

Q. I don't want what you have heard, I want to know if you know?

A. I have not been in the cattle sheds and have not attempted to count the cattle present. I don't know.

Q. Have you made any examination of the character of the discharges from those cattle sheds?

A. Yes, I have seen the discharges.

Q. Have you ever analyzed them?

A. I have not.

Q. Do you know the population of the city of Peoria?

A. Not exactly, no.

Q. Do you know the amount of the sewage discharged from the city of Peoria?

A. I do not.

Q. Is it 50,000?

A. 50,000 what?

Q. Population?

7279 A. I don't know. I believe it is considerably above 50,000,—nearer 100,000 than 50,000.

Q. Well, will you say it is 100,000?

A. I will not say anything about it; I don't know.

Q. In your chemical analyses then you have not taken into consideration the population of Peoria, or the extent of the cattle industry at that place?

A. In my analyses I am not concerned with that.

Q. Well, in your opinion upon the sanitary condition of the water below Peoria have you?

A. In forming my opinion I have taken in consideration the fact that there is a large amount,—or there are a large number of cattle fed there, and that there is a very large amount of grain mashed at Peoria, mashed before fermentation, and that this offal or slop from this in various years has been sufficient to amount to a contamination equal or in excess of that proceeding from Chicago.

Q. Professor, which is the more objectionable as a polluting substance in water used for domestic purposes,—the swill discharges from the distilleries or the sewage discharges from the human excreta of the city of Peoria?

A. Inasmuch as the swill discharges from the city of Peoria are mixed discharges, that is the distillery discharges
7280 are mixed discharges containing in many cases the excreta of animals as well as the residues left in the mashing and fermentation of grain, and inasmuch, further as these residues left in the mashing and fermentation of grain are comparatively large and almost wholly nitrogenous in character, and because of the further fact that this nitrogenous substance has not yet begun to undergo chemical or bacterial disintegration, and that such disintegration is a factor which consumes considerable time, and as the first products of this disintegration require a relatively large time for the final disposition, it is my opinion that the discharges from Peoria are as important,—probably more important in the contamination of the lower Illinois river, than the discharges from Chicago. The discharges from Chicago when they reach—

Q. Professor, I don't believe you understand my question. Pardon me for interrupting you. I don't have Chicago in the case.

A. Well I am putting it in comparison here.

The discharges from Peoria consisting as they do, largely of material in which the progress of oxidation is very slightly advanced, require a longer time for their final decomposition than would the discharges which have gone through the human organism, and in which the decomposition has been practically
7181 completed. That while from an esthetic standpoint the excreta discharged may appear very much worse, yet from a chemical standpoint, when we consider the nature of the substances, it is a very strong and reasonable prop-

osition that the highly nitrogenous and proteid discharge of a distillery must be considered as a more objectionable substance than the organic matter of fecal discharge.

Q. Objectionable in what way?

A. Objectionable because of the fact that a longer time,— a much longer time is required for its final disposition; because of the fact that it will afford for a much longer time a medium for the growth and development of these organisms which the bacteriologists tell us are really objectionable.

Q. Now you wish to draw that distinction between the chemical constituents of fecal matter that comes from the human being, and that which comes from the animal?

Q. No, that is not a distinction that I have attempted to make. I am speaking of the residues from distillery discharges, in which we have for every bushel of grain mashed, seven or eight pounds of waste, largely nitrogenous.

Q. Now professor, I will ask you if there is anything harmful to your knowledge in the mash that is not used by the distillery, after the spirits are taken from it?

7282 A. In the fresh mash there is certainly nothing harmful, but I know of no fouler contamination or worse smelling, or worse acting putrefying substance than this slop material when it begins to undergo bacterial decomposition.

Q. How does that mash that is so deposited into the Illinois river, compare with the ordinary farm and barnyard washings of the country?

A. That substance when deposited into the Illinois river, consists pre-eminently and characteristically of undecomposed protein substances, and must be considered as far more objectionable than the ordinary agricultural farm washings.

Q. Professor, are you using the word "objectionable" in this connection with reference to the health of those people who drink the water?

A. I am using that word "objectionable in the sense of applying to the character of the products, as produced from this material in its early stages of putrefaction.

Q. But do you use it in connection with the effect that it produces upon the health of the people who drink it?

A. The effect of that material on the health of the people I think would be markedly bad. To tell what that effect

would be is a proposition which I would not care to discuss, but
I have made and have seen made, experiments on the put-
7283 refaction or bacterial decomposition of this material and
I consider that the effect of such a production if consumed,
on the health of the people would be from the most superficial examination, bad.

Q. Then professor, if the effect of the decomposition and putrefaction of that material in a running stream produces ill effects upon the people who drink it, what effect would the sewage from the entire city of Chicago have upon the people who drink it, in comparison with that which comes from Peoria?

A. It is not possible to make a comparison between the sewage of Chicago and that material, because of the vastly different character of the two substances. I have been at some pains to explain that the sewage of a large city consisting in the main of the products of animal disintegration, contains substances which have been largely broken down, and in which the complex molecules have to the extent of 95 to 99 per cent at least been broken down, or in the proportion, as I think I explained this morning, of 16,000 to below 100, while in the sewage of such a region as Peoria these complex organic substances have still to undergo decomposition, and the effect of this will therefore be observed for a very much longer time. Now to make my meaning a little clearer, perhaps, I will say this; that in
the disintegration or breaking down of the protein sub-
7284 stances from foods, the products of excreta, the nitrogen-
ous products of excreta are in the main these: urea, uric
acid and creatine, with smaller amounts of other substances in nature similar to uric acid. The extent of decomposition here is measured as I have said, by the relative size of the molecules in question. The original substances to be decomposed,—or which have undergone decomposition, are of infinite complexity. The protein bodies have a complexity measured by the molecular weight itself, in some cases 15,000 or 16,000,—so great that we cannot determine it with the highest accuracy. The products formed from this are smaller. In the case of urea, we have a molecular weight of 60, and urea represents a very large portion,—perhaps 85 to 90 per cent of the total destruc-

tion of the proteid of our food. Uric acid, of which a very much smaller amount is excreted, has I believe a molecular weight of 168. It is not very important. The creatine, I think is 131. But the point is that we have the destruction of the original substances in that proportion. These are all far advanced on their way to final disposition when they leave the body and enter the sewers, and furthermore, from the fact of their being broken down into these substances, they are in a condition to speedily undergo further decomposition. As everyone knows, the final decomposition of urea is a process which takes place very rapidly,—extremely rapidly in sewers, and the
7285 decomposition of uric acid and creatine as I have observed in experiments, is also comparatively rapid, so in the household sewage or ordinary city sewage, the products have been already largely decomposed and are more readily finally decomposed. In the distillery refuse, because we have the very large complex substance there not yet broken down, and because they must undergo the first as well as the final stages of decomposition a very much longer time is required for that decomposition.

Q. Then professor, based upon your last answer, why is it that you refuse to recommend for domestic and drinking purposes, the water of any river into which the sewage from any human being is discharged?

A. In answer to that question I will state that which I have already stated, that while these organic matters are in a way objectionable, where we find them there is always the possibility that something else may be present of much worse character. The presence of organic matter may suggest the presence of organized matter, and that the bacteriologists and etiologists tell us is something to look out for.

Q. Professor, do you know how much residual matter remains in the analyses of the water of the Illinois river above Peoria, coming from Chicago?

7286 A. I know only what I have already stated in my reports, and which have been put in evidence. I know it is reduced to a rather small amount. I cannot tell you without going back over the reports again, how much.

Q. Professor, assuming that during the entire year of 1900, there were frequent heavy rainfalls on the water-shed of the Illinois river so as to cause more than an ordinary large volume of water to flow continuously throughout that year down the Illinois river, from natural sources, and assuming that in addition to this flow during that year there was added the water and sewage coming from Lake Michigan and the city of Chicago through the canal; and assuming further that at some succeeding year, since the opening of the canal there was comparatively small rainfall throughout the Illinois river valley and its tributaries, and that the volume of water coming down the river from natural sources was materially less than that coming down in 1900, and that during that period, water from Lake Michigan, and the sewage from Chicago came through the drainage canal and into the Illinois river, what effect would the increased flow in 1900 have upon the pollution of the water of the Illinois river with the sewage of Chicago, as compared with the suceeding year mentioned?

MR. TODD: I object to the question being predicated 7287 upon succeeding years, because it does not assume any increased flow of water in the drainage canal in succeeding years, over that which existed in 1900, and in order to make the conditions obtaining, such as will obtain in any succeeding year that increased volume of flow from Lake Michigan into the drainage canal over the Beartrap dam, is a matter that should be taken into consideration.

A. Well, before I attempt to answer that question I would like to have it read again slowly.

(Question read).

A. If as assumed in this question, in 1900 there was a large amount of water from tributaries and from rainfalls, in addition to the large amount of water from the drainage canal, and then assume that that in some subsequent year we have a very much smaller amount of water from the tributaries of the Illinois, and the same amount of water flowing through the drainage canal, or no increase of water from Lake Michigan through the canal, with the same amount of sewage discharged, it would follow as a matter of course, that in the succeeding years the dilution at the mouth of the Illinois river, as compared with the 1900 period, would be less, making all those assumptions.

7288 Q. Now then, professor, as to the increased and decreased volume of water passing down the Illinois river from these natural sources, such as were referred to in the preceding question, would that not create a variation in the extent of the pollution, and therefore a variation in the sanitary condition of the water as it enters the Mississippi river, from the standpoint of dilution alone?

A. If the dilution at the mouth of the Illinois river were allowed to depend mainly on the water of the tributaries, then there would be of necessity a variation in pollution there, and possibly some variation in the sanitary condition, but if the water from the tributaries becomes gradually a small factor, compared with the great and to be, greater flow in the drainage canal, then these variations become of less and less moment in the succeeding years.

Q. Now professor, assuming that in the future there is an increased volume of water flowing through the Chicago drainage canal and an increased amount of polluted matter from the city of Chicago caused by an increase in its population, I will ask you if this additional body of water flowing into the Illinois river would not hasten the water from Chicago to the mouth of the Illinois river, and to the extent of time limit, retard oxidation of such polluted matter as it might contain—Yes or No?

7289 A. It is possible that an increase of water might, by hastening the flow, push farther down the point at which oxidation is completed.

Q. Now that would be particularly true during low water periods wouldn't it, Yes or No?

A. That cannot be answered by Yes or No, because it gives no relation to the flow of the river in the low water period.

Q. Well as compared to the high water period?

A. Well perhaps in the low water period it would. That would be very hard to answer directly or positively, Yes or No.

Q. Professor, assuming that the amount of organic matter in the Illinois river at Grafton is the same as it was prior to 1900, is it not true that due to the increased volume of stream flow, the aggregate amount of objectionable organic matter in the Mississippi river is greater now than it was prior to 1900?

By that I mean the organic matter as shown in the samples from which analyses were made and shown by your tables introduced in evidence.

A. If we grant that assumption that the amount of organic matter in the Illinois river is greater now than it was before 1900, then it would necessarily follow, taking in the stream
flow also, that the aggregate amount of matter in the
7290 Mississippi river must be increased, but not necessarily
the important factor, which is parts per given volume.

Q. Professor, assuming that the Illinois river exists in its primal condition, with no pollution there either as to human beings or as to domestic animals, and that the Illinois river itself exists as at the present time and that the Chicago sewage enters as it now does, into the Desplaines river and thence into the Illinois river, are you able to state that all objectionable and injurious qualities of the Chicago sewage would be eliminated by the time it reaches Grafton?

A. In answer to that question I will say, as I have said before from the study of all the results of the chemical analyses which I have made of the water from Chicago to Peoria, and through Peoria and to the mouth of the river, I see nothing in the condition at the mouth of the river which suggests at all that the condition today organically is any worse than that in the ordinary streams of the state, and any worse than that which might have existed in the upper Illinois river. In comparing the Illinois river at its mouth, with the waters of the various tributaries through the season of 1899 and 1900, when such comparisons were made, I notice, and have noticed and have referred to the fact that the peculiar relation of the factors of albuminoid ammonia, to oxygen consumption,—in other words the ratio
which the factors expressing the albuminoid ammonia,
7291 bear to the factors expressing the oxygen consumption,
are very similar, practically, identical at the mouth of the Illinois river with what we observe in the examination of the tributaries. It is a peculiar and very interesting fact that for the tributaries the relation of the oxygen consumption, or the ratio of the albuminoid ammonia to the oxygen consumption is nearly a constant value which would be expressed, taking the average of all streams, by .07 about; we find by observing the same relation as I have before mentioned, several times, prac-

tically the same figure at the mouth of the Illinois river, while the characteristic figures of waters with known animal pollution or containing essentially animal pollution, show a factor in the mean, about double this; so from these observations I am inclined to say that as far as the organic pollution is concerned, the Illinois river today, as disclosed by the analyses I have made, and these are the only things on which I am at the present basing an opinion—is very similar, practically identical with the waters flowing through our state, and taking up a large amount of organic matter from the soil and decaying vegetation.

Q. Now professor, assuming the conditions mentioned in the last preceding question, will you state that no part of the objectionable pollution from the city of Chicago under
7292 those conditions, or under the conditions mentioned in the question, reach the intake tower at St. Louis?

A. I do not undertake to make any positive assertion of that kind, but from all of the evidence with which I am acquainted I see no reason to believe that any of the original elements of the Chicago sewage have reached the intake of the St. Louis waterworks.

Q. Now professor, you understand that in these last two questions I have eliminated every source of sewage pollution and domestic animal pollution and industrial waste, and I have placed the Illinois river valley, which includes its tributaries, in their primal condition.

A. That condition is fully understood and the answer is based upon that understanding of the question.

Q. Professor, under the assumptions just made in the last preceding questions, with the discharge of the sewage from the people of Chicago, containing 1,600,000 people, into the Illinois river, would you recommend under those assumptions, the use of the Illinois river at Grafton for domestic purposes in its raw condition?

A. As I have several times stated I would not under any circumstances recommend any river water in its raw condition for consumption, and in that general statement I will
7293 include the Illinois river and the Mississippi river and the Missouri river, or any river.

Q. And would you include the Illinois river under the conditions mentioned in the assumptions of the questions previously read?

A. I will include all large natural streams in that.

Q. Would you include the waters of the Illinois river at Grafton under those assumptions?

A. I will say that under all the assumptions, I will object to the waters of natural large streams. That is, I wouldn't recommend them for household consumption in general.

Q. Now professor, supposing we eliminate from the river the sewage of Chicago and also make some limitation as to the deposits into the rivers and its tributaries, as contained in the assumptions in the previous question, what would you say as to the condition of the water?

A. If I knew that all possible sources of contamination were eliminated from the Illinois river I shouldn't object to its use for household purposes.

Q. Professor, assuming that all possible sources of pollution are removed from the entire drainage area of the Mississippi river above the chain of rocks, and that the said watershed and drainage area was in its primal condition, what would you say as to the condition of the water at the chain of
7294 rocks in the Mississippi river, as suitable for domestic purposes from a hygienic standpoint?

A. Necessarily under those conditions, with all possible sources of contamination removed, the water would have to be considered suitable for household use.

Q. Now assuming professor that the entire watershed of the Mississippi river above the chain of rocks at St. Louis, to be in the same condition as expressed in the former question; in other words in its primal condition, and assuming that the sewage discharges from 1,600,000 people residing in the city of Chicago being discharged into the Illinois river by means of the canal as it now exists and the waters of the Illinois river entering into the Mississippi above the chain of rocks as they now enter, what would you say as to the sanitary condition of the water of the Mississippi at the chain of rocks for domestic use from a hygienic standpoint?

JUDGE SPRINGER: I object to this question on the ground that the assumption is not based on any facts that are in this case or that can possibly be brought into the case; it is wholly an abstraction and not pertaining in any way to this case, being a condition that never has existed and never can exist.

7295 A. With such an assumption, and the evidence that I have of the rate and conditions of purification in the Illinois river, and with no other discharges into the Illinois river in its course of 300 miles and over, I see no reason to condemn the Mississippi river at the chain of rocks, because of the entrance of the sewage of Chicago plus no other contamination, over 300 miles above.

Q. Can you state, professor, whether or not under those conditions the contaminating qualities or properties from Chicago would not reach the Mississippi river at the chain of rocks at St. Louis?

A. From all the evidence in my possession, I believe that none of the contaminating properties of Chicago would reach that far. I have nothing to show that they do.

Q. Professor, how far is it from the chain of rocks to the mouth of the Illinois river?

A. Thirty or forty miles.

Q. Now then, I want to ask you, that inasmuch as you have under the first assumption which referred to the primal condition of the Illinois river valley except as regards the sewage of Chicago coming through the canal, stated that you would not recommend the water at the mouth of said river as suitable for domestic purposes in its raw condition, will you state 7296 whether or not under such an assumption which takes in the entire Mississippi river watershed above the chain of rocks, that no part of the pollution from the city of Chicago reaching there and being objectionable to you under the first assumption, does not reach the chain of rocks under the second assumption, the increased distance caused by the stretch of river from the mouth of the Illinois river at Grafton to the chain of rocks being about 34 miles?

A. That question is still pretty complicated and seems to hinge on what is understood by raw water. In making these comparisons of raw water I have in mind the natural water such as existed in our streams, but from the various examinations which I have made, I cannot consider a water as raw which has undergone purification through a distance of 300 miles, and therefore I would not be inclined to condemn the Illinois river on that basis and for that reason.

Q. The question is not, do you condemn the water of the Illinois river, professor, but whether or not any of this pollution,—polluted matter which was objectionable to you under the assumption with reference to the primal condition of the Illinois river valley, except as to the sewage discharges of the city of Chicago through the canal which existed at Grafton, whether it would reach the St. Louis waterworks intake
7297 at the chain of rocks, a distance of nearly 34 miles.

A. I have nowhere stated that. There was no evidence to show that any of this original pollution ever reached Grafton, and there would be still less evidence to show that it reached the chain of rocks. If I have conveyed that impression in any answer, and I don't see how I have, it is a mistake. I insist emphatically that there is nothing to show that original contamination from the city of Chicago does reach the mouth of the Illinois river or the chain of rocks.

Q. I will ask you if there is anything to show that it doesn't reach there?

A. I have answered in substance that question several times.

Q. Well, answer it Yes or No, as to whether or not there is anything to show accurately and exactly whether it does?

A. It is not possible to answer a question of that kind accurately by Yes or No.

Q. And the most of it is derived largely because of the varying temperatures of the water, for instance, the temperature of the water in the summer time as compared with what it is in the winter time, thereby retarding oxidation. Among other things, isn't that true?

A. There is also the temperature to some extent. It does interfere with the rapidity of oxidation, I suppose.

7298 Q. Then taking all these things into consideration, wouldn't you say that the objectionable matter that might exist in the river at Grafton, under the circumstances mentioned in this assumption would not reach the St. Louis waterworks intake at the chain of rocks?

A. If it has been anywhere assumed that this objectionable matter reaches Grafton, that assumption was not made by myself.

Q. But we are speaking now, of that objectionable matter exists and the objectionable matter coming from Chicago, if it exists at Grafton, at the mouth of the Illinois river, does it or does it not reach the chain of rocks, a distance of 34 miles?

MR. TODD: I object to the question on the ground that the assumption is not based on the assumption of this witness, and for the additional reason that taking the assumption purely hypothetically it does not state the original amount of objectionable matter that is at Grafton which came from Chicago.

Q. (Question repeated)—under the assumptions made in the last preceding question?

A. If the assumption be granted, which it is not, that original organic contamination reaches Grafton from Chicago, then I would not be prepared to state that it might not reach the chain of rocks.

7299 Q. Then assuming that it reaches Grafton, you would not state that it would not reach the chain of rocks?

A. Assuming that this contamination reaches Grafton, I would not like to state that it might not reach the chain of rocks, but I have not made any such assumption myself.

Q. And the quantities that reach the chain of rocks would depend upon the quantity relatively speaking, that reached Grafton?

A. As we say in mathematics it would be a function of it.

RE-DIRECT-EXAMINATION,

By Mr. Todd.

Q. Professor, upon the assumption that the Illinois river was a virgin stream, receiving no pollution or contamination from Lockport to Grafton except that which enters through the drainage canal, you want to be understood as saying that at Grafton then can not be found the original organic matter which empties into the Illinois river from the Bear Trap Dam and the drainage canal of Chicago? Under that assumption of pristine purity of the Illinois river?

A. Under that assumption, I do not wish to be understood as saying that any of the original pollution could pass that far in the channel.

7300 Q. Will you locate definitely, or as definitely as possible, the points where the samples of water were taken below Peoria, at the location which you have denominated Wesley?

A. Well, I have described that as accurately as possible, in answer to a question of Mr. Jeffries, that the point is on the opposite side of the river from Wesley, Wesley being opposite Peoria and farther down.

Q. How far from the opposite shore of Wesley was it?

A. It is, as near as I can now recollect, about a half mile below Wesley. It was around a considerable bend in the Illinois river at that point, which bend is also below Wesley. There is rather a marked bend there and this bend is a considerable distance below that.

Q. And how far from the Peoria shore?

A. Oh, from the Peoria shore, it was half way across as near as I could estimate, between the Peoria shore and the opposite shore.

Q. Did you say a half a mile below Wesley?

A. Yes, sir.

Q. A half a mile below Wesley in the center of the river?

A. As near as could be determined, in the center of the river.

RE-CROSS-EXAMINATION, by Mr. Jeffries.

Q. Now, Professor, were those samples taken below Peoria, always taken at the same place each day?

A. I gave my instructions to the collector to take them at
7301 the same place, but of course I wasn't present when he
took them.

Q. I will ask you if the increased volume of water from day to day, and the variations in the decrease of the water from day to day would not have some effect on changing the places in the river where you would get a general mixing of the water from Chicago and the deposits from the cattle pens in the Illinois river?

A. It is possible.

Q. So that unless the river remained in the same condition from day to day during the time these samples were taken and that point of mixing did not change, you could not absolutely rely upon all these samples as properly representing a fair mixing of the water at that point?

A. I think they would be as fair as samples can be taken. Of course I am willing to grant that all water-takers are more or less uncertain, but it was my aim to have those samples collected, representing the volume of water at that point as fairly as possible.

Q. Now, Professor, in the first question asked you by Mr. Todd in his re-direct examination, you meant, as I understood it, that it was your opinion that no part of the original organic matter representing the sewage of Chicago, could be found
7302 at Grafton under the virgin condition of the Illinois river?

A. That was as I understood his question.

Q. You didn't mean by that that the residual organic matter could not be found there?

A. No, as I have explained, that residual organic matter was so comparatively stable that it may pass very long distances in a stream.

Q. And you did not mean by that that these certain specific living organisms that follow the result of these properties in the analyses of the water, would not be absent at that place?

A. I have not wished to make any statement about the length of time that those organisms would live. That I have frequently stated, is outside of my province.

Q. Then as I understand it, you would not say that they would not be present there?

A. I would not say from my own knowledge, whether they would or would not be present. On that proposition I do not care to give any opinion.

JOHN H. LONG.

7303 F. ROBERT ZEIT,

called as a witness in behalf of the defendants, being first duly sworn by the Commissioner, was examined in chief by Judge Springer, and testified as follows:

Q. What is your name?

A. F. Robert Zeit.

Q. Where do you live?

A. At 4016 Vincennes avenue, city.

Q. What is your occupation?

A. Teacher at Northwestern University Medical School and Post Graduate Medical School of Pathology and Bacteriology.

Q. How long have you occupied that position in the Northwestern University?

A. This is the fifth year.

Q. State what courses of study you pursued before your acceptance of this position, your early education?

A. My early education was received in Switzerland and Germany and my medical degree is from the Western Reserve University at Cleveland, Ohio. I was afterwards three years with Prof. Klebs, and when he opened his laboratory here in the city, I was his instructor for three years.

Q. Who is Professor Klebs?

7304 A. He is one of the noted bacteriologists. For twenty-five years he was a teacher of pathology and bacteriology, at German, Swiss and Austrian universities, and was induced to come to this country, and was here five years in all. He was called to Rush Medical College as professor of pathology.

Q. How long were you in that position at Rush Medical College?

A. He was professor of pathology of Rush Medical College, and besides had a private laboratory where I was instructor and collaborator with him for three years. From there I was called to the Northwestern University as a teacher in bacteriology. After one year I was made professor of bacteriology at Northwestern University Medical School and one year or more ago I was given the whole department of pathology and bacteriology. So really my function at the school was originally bacteriologist purely. I was that when this report was made.

Q. You stated that you took a degree at the Western Reserve Medical College at Cleveland, state what the nature of your duties there, was?

A. The regular medical course. I obtained my M. D. degree at Cleveland, Ohio, in 1887.

Q. How long did you remain in that school?

A. From 1884 to 1887.

7305 Q. Have you attended any other medical school?

A. I have not.

Q. Or any other institution?

A. No, no other except those named.

Q. Have you practiced your medical profession at any time?

A. I have practiced medicine and surgery.

Q. How long?

A. About ten years.

Q. Where?

A. Partly in Wisconsin and partly in Chicago.

Q. Have you made any special studies as to the causes of disease of human beings?

A. Yes, at repeated times.

Q. How is that?

A. Of course constantly during my occupation as a teacher, I have in the last seven years been purely employed in the teaching of bacteriology and pathology. I have not practiced medicine or surgery for the past seven years.

Adjourned until 10:00 a. m., following day, Friday, October 2nd, 1903.

10:00 A. M., Friday, October 2nd, 1903.

7306 Continuation pursuant to adjournment.

Present, the Commissioner and same counsel representing the respective parties.

PROF. F. ROBERT ZEIT,

resumed the stand for further direct-examination by Judge Springer and testified as follows:

Q. Professor, did you make any bacteriological examinations of the waters of the Chicago drainage canal and the Illinois river in the year 1900?

A. I did, between February 6th and October 1st, 1900.

Q. From whom did you get the samples of water examined by you?

A. From Professor Long.

MR. JEFFRIES: We object to the answer for the reason that there is no evidence showing that the samples obtained by this witness or any of the samples that were taken out of the Illinois river or the drainage canal, and no evidence showing that the samples were taken under his direction, or the manner in which the samples were taken.

7307 JUDGE SPRINGER: In reply to that objection, I call the attention of counsel to the evidence of Dr. Long, and to the evidence of the various persons who testified in regard to taking the samples of this water, and their examination in the investigation, so far.

MR. JEFFRIES: *I suggest that there is no water taker* who testified that he took samples for this witness.

JUDGE SPRINGER: No, this witness states that he got the samples from Professor Long.

Q. Did you personally know anything about the taking of samples of the water from the canal or river?

A. I do. I have seen many of those samples arrive by express, and I received from Professor Long the original four ounce bottles, ice packed, covered with rubber cloths, which were used in my experiments.

MR. JEFFRIES: Now I move to strike out all that the witness has said with reference to the bottles received from Professor Long, for the reason that bottles so received by this witness, as shown by the testimony in evidence, was a limited number and not such a number as would justify any conclusions as to the sanitary condition of the water in the Illinois river, and for the further reason that sanitarians are unable to derive any value from the results of a limited number of 7308 analyses of any water, and especially water flowing in a running stream, and for the further reason that the evidence shows that the samples so collected were not so taken as to cover storm periods, cold weather periods and all the variations of the river, and the water therein, and for the further reason that the evidence does not show that the samwere so taken as to obtain a correct bacteriological examination of the water in the Illinois river at flood times, commencing at the source of the flood, or the entrance of the flood into the Illinois river and following it to its mouth, so that any analyses made by this witness of the water of the Illinois river would be incompetent, irrelevant and immaterial and of no probative force.

JUDGE SPRINGER: In reply to this objection I will state that it is principally argumentative and would be better addressed to the court, rather than put into the evidence. We will proceed to show how far the testimony will disclose the value of these examinations.

MR. JEFFRIES: I object to the statement of counsel for the reason that he is not on the witness stand.

JUDGE SPRINGER: I say, we will proceed to prove that.

MR. JEFFRIES: I object to the statement going into the record.

Q. JUDGE SPRINGER: I call attention to the book 7309 entitled: Illinois State Board of Health, Sanitary Investigations of the Illinois River and Tributaries, 1901—

MR. JEFFRIES: I object to the witness' attention being called to the report of the Illinois State Board of Health for the reason that the report is no evidence.

Q. (Continuing) I also call your attention to page 46 of that report—

MR. JEFFRIES: Objected to for the same reason.

JUDGE SPRINGER: You will save trouble if you will wait until I finish my question.

Q. (Continued) I call your attention to page 46 and the succeeding pages down to page 62, and the tables that are printed therein. Please state whether the tables which you find printed on those pages of that report contain the chemical analyses of similar samples examined by you bacteriologically during that period?

MR. JEFFRIES: Do I understand this witness to be a chemist?

JUDGE SPRINGER: No. These were Dr. Long's chemical analyses and he used the same water for samples taken at the same time for bacteriological examinations.

MR. JEFFRIES: I object to the question for the same reason stated in the objection to these tables when called 7310 to the attention of Professor Long. I object to them for the reason that the original tables upon which the results of the analyses were recorded, is the best evidence, and that these tables constitute no evidence whatever; that there is no evidence showing that the result of the bacteriological examinations are properly recorded, and any statement that this witness might make in reference thereto, is not competent, because the original table is not present so that the witness may be cross-examined thereupon, and that unless the said tables upon which the original results are recorded are produced in order to enable counsel to cross-examine him thereon, any statements that he may make in reference thereto are incompetent, irrelevant and immaterial, and I object to the question for the further reason that the tables themselves do not show that a sufficient number of examinations were made at the various places to enable any scientist, etiologist or epidemiologist, to determine the character and condition of the water of the river at the points where taken, or at any other place, so that such testimony and such evidence would not be trustworthy, of no moment and of no consequence, and therefore not competent proof, nor legal evidence.

JUDGE SPRINGER: I would suggest that in reference to this objection, that it would be better addressed to the court, as it goes to the weight of the evidence and not to the materiality. 7311

MR. JEFFRIES: I suggest that the objection as to the right to be shown the tables from which analyses were made, in order to cross-examine the witness on the point, is proper at any time, and I state here to the Court that no opportunity is given to me to cross-examine the witness upon the original tables made at the time the examinations were made, and upon which the results of the examination were recorded.

JUDGE SPRINGER: You have reference to Dr. Long?

MR. JEFFRIES: I have reference to this witness.

JUDGE SPRINGER: We have not got to the cross-examination of this witness yet.

Q. Now professor, you may answer the question that I put before.

(Last question read)

A. They do.

JUDGE SPRINGER: I will state here for the purpose of explanation, that these tables were put in evidence by Dr. Long in his testimony, and that I simply refer to the tables as already in evidence, and not to put these in evidence at this time, but referring to them as already in evidence.

MR. JEFFRIES: If it be true that the bacteriological tables of this witness were introduced in evidence by Professor Long and so sworn to by him, I move to strike them out for 7312 the reasons stated in our previous objection, that we have not been given an oportunity, on account of the failure to produce the original tables, to cross-examine this witness as to the correctness of the entries made thereon.

Q. JUDGE SPRINGER: I call your attention in these tables, professor, to the column headed "Colonies per C. C." Will you please state whether those ascertainments were made by you?

A. They were not.

Q. They were not?

A. No.

MR. JEFFRIES: We move to strike them out for the reason that the witness says that they were not made by him.

Q. JUDGE SPRINGER: Now state what you did in reference to making examinations of the samples of water that came to you at the times and from the places stated in these tables?

MR. JEFFRIES: I object to the question for the reason that the witness has not stated that a sufficient number of examinations were made to enable anyone to determine the quality of the water at that place, or the particular bacteriological properties of that water with reference to the sanitary condition or unsanitary condition of that water.

A. The specimens of water which I received from Professor Long were plated out on gelatin and agar, from three to 7313 sixteen dilutions were made in Petri dishes. We also made glucose agar plates for growth of an-aerobes. The object of our examination was principally to determine the presence of pathogenic bacteria, or the absence of pathogenic bacteria in the specimens of water submitted. That was our function in the investigation. No other. We did not make any counts of colonies nor tests for fermentation or indol production, or any of the usual tests. All the gelatin plates were kept at a temperature from 20 to 22 degrees centigrade; the agar plates in the incubator at 37 degrees.

Q. Centigrade?

A. Centigrade. The plates were examined daily and pure cultures obtained on agar from the various colonies, between the second and eleventh day. The pure cultures were then subjected to such further study as seemed necessary for their identification, such as growth on the different cultures media.

We further made a number of animal experiments, with all the samples obtained, or which were given to us by Professor Long. The experiments included intraperitoneal injections of guinea pigs with four cubic centimeters of the water of every station. Another set of experiments with the same waters included the inoculation, also intrapitoneally, with cultures made by adding one cubic centimeter of the suspected water
to five cubic centimeters of nutrient bouillon and keeping
7314 the mixture in the incubator at a temperature of 37 de-
grees centigrade for 24 hours. Of these cultures, one
cubic centimeter was injected intraperitoneally into guinea pigs. The object of the latter experiment was to favor the growth of pathogenic bacteria and keep back the growth of non-pathogenic saprophites and water bacteria. In other words, to enrich the water in disease producing bacteria by adding a favorable culture medium and exposing them to a favorable temperature. Disease producing bacteria are favored and multiply rapidly at 37 degrees centigrade, whereas water bacteria would be somewhat held back by such a temperature. The culture thus enriched in pathogenic bacteria was injected intraperitoneally and when the animal died, cultures were taken from the blood, the heart blood, the spleen and lymph glands. Also smears were made at that time, and a diagnosis as to the disease and the organism causing the death was attempted and made in most of the cases.

Q. Please state, professor, in detail now, the results obtained by the various bacterial examinations which you made, the number of examinations made of the waters of each place, indicating the number of bacteria, pathogenic and non-pathogenic, found, and what tests were made, if any, to determine the number of pathogenic bacteria that may have been in the samples?

7315 MR. JEFFRIES: The question is objected to for the same reasons stated in previous objections,—that the witness has not produced the original table from which these results were recorded, and by reason of failure to so produce and so testify, counsel for complainant have been denied the privilege of cross-examining the witness upon the correctness of said tables. We object to the question for the further reason that the witness is reading from the report of the Board of Health of the State of Illinois; that that part of the report which he is reading from, which he is testifying about, shows that no sufficient number of samples was analyzed by him and his assistants to determine the correct character and state of the water in the Illinois river at the various places that the samples were taken; nor do these samples display the correct bacteriological character of the water of the Illinois river, at flood times, at winter times, at low stages, at high stages; nor are any floods followed from source to mouth, so as to correctly determine the bacteriological condition and changes that the water undergoes from the source of the flood to the mouth of the Illinois river, and for the further reasons that the samples were so sparsely taken, and that there were so few examinations made, that no epidemiologist or etiologist, and no sanitary engineer or 7316 sanitarian of any character would consider them of any importance whatever in passing upon the sanitary condition of the water flowing down the Illinois river, and the bacteriological changes resulting therein.

JUDGE SPRINGER: I object to the argument of counsel in which he states that these findings are of no value. That is a question for the court to determine, and not one as to the admissibility of the evidence; it goes to the weight only.

MR. JEFFRIES: It goes exactly to the admissibility of the evidence, Judge Springer, for the purposes for which it is introduced.

Q. (Question repeated).

A. We examined from Lake Michigan tap water seven specimens. In the determination of pathogenic bacteria we found the colon bacillus three times;

the bacillus lactis aerogenes, once;
the micro rhizopodiformis, once.

The guinea pigs infected with four cubic centimeters of the different specimens of water injected intraperitoneally, all recovered. Three of the specimens containing pathogenic bacteria were placed in the incubator at 37 degrees centigrade for 24 hours with nutrient bouillon, one part of the water to five

parts of bouillon. Three guinea pigs received an in-
7317 trapitoneal injection of one cubic centimeter of this 24 hour bouillon culture. Only one died of sepsis. The blood of the animal contained bacilli coli communis. Subcutaneous injections caused only a local abscess, the animal recovering. Some of these specimens of water contained a moderate variety of bacteria commonly found in sewage, but only one of the samples contained virulent coli bacilli.

Q. Will you please state the non-pathogenic bacteria or micro-organisms you found in these waters, and the number of times each genus or specimen was found?

MR. JEFFRIES: Does that mean with reference to all of the examinations?

JUDGE SPRINGER: Yes. Please read my question.

(Question read).

A.	Micrococcus aquatilis,	2 times
	Micrococcus flavus liquefaciens,	1
	Bacillus subtilis,	4
	Bacillus mycoides,	1
	Bacillus mesentericus,	3
	Bacillus reticularis,	1
	Bacillus liquidus,	2
	Bacillus aquatilis,	2
	Bacillus flourescens liquefaciens,	1
7318	Bacillus flavescens, Pohl,	1
	Vibrio aquatilis, Gunther,	2
	Vibro aureus,	1
	Sarcina rosea,	1

Q. Did you make any examinations of the samples of water coming from Western Avenue in the new drainage canal, if so how many such specimens were examined and what bacteria were identified?

A. We examined thirteen specimens and the following bacteria were identified, of the pathogenic bacteria:

Bacillus coli communis,	9 times
Bacillus lactis aerogenes,	4
Bacillus enteritidis,	3
Proteus vulgaris,	6

Of the non-pathogenic bacteria the following were identified:

	Micrococcus candicans,	3
	Micrococus agilis,	1
	Sarcina lutea,	2
	Bacillus subtilis,	3
	Bacillus mycoides,	2
	Bac. mesentericus,	2
	Bac. aquatilis sulcatus I,	3
	Bac. aquatilis,	3
7319	Bac. acidi lactici,	2
	Yellow water bacillus,	1
	Bac. cloacae-Jordan,	3
	Bac. reticularis-Jordan,	1
	Bac. delicatulus-Jordan,	1
	Bac. ubiquitus-Jordan,	1
	Bac. albus putidus,	1
	Vibrio aquatilis-Gunther,	1

Intraperitoneal injection of guinea pigs with four cubic centimeters of the sample of water did not prove fatal. Twenty-four hour mixtures grown at 37 degrees centigrade with one part of water and five parts of nutrient bouillon caused a fatal septicemia by intraperitoneal injection of one cubic centimeter.

Several of the pure cultures of the bacillus coli communis obtained from these samples were non-virulent, whereas the above mixture invariably proved fatal.

Q. Did you make any examinations of samples of water which came from Bridgeport, and if so, state the organisms identified.

A. I received seven samples of water from Bridgeport. The organisms identified are as follows:

Pathogenic.

	Bac. coli communis,	6
	Bac. lactis aerogenes,	4
7320	Bac. enteritidis,	2 times
	Proteus vulgaris,	6
	Bac. pyocaneus,	2

Non-pathogenic.

Micro. candicans,	2 times
Micro. flavus desidens,	2
Bac. subtilis,	2
Bac. mycoides,	1
Bac. mesentericus,	1
Bac. superficialias,	2
Bac. aquatilis sulcatus I,	1
Bac. aquatilis,	1
Bac. liquidus,	1
Bac. florescens liquefaciens,	2
Bac. acidi lactici,	2
Bac. rubidus,	1
Bac. aerogenes,	1
Bac, plicatus,	1
Bac. cyanogenus,	1

MR. JEFFRIES: I object to the witness reading the table for the reason that he has stated that he only received seven samples at this place, while he received a larger number at other places, and that by reason thereof, no comparison can be
7321 drawn from the bacteriological condition of the water
in the respective places. In other words the results so obtained from the samples are not competent.

JUDGE SPRINGER: I submit the question of competency is not involved. It is a question as to the weight of the evidence.

Q. Proceed, professor, to state what examinations you made for the purpose of determining the character of these organisms.

A. The intraperitoneal injection of four cubic centimeters of several samples of water into a guinea pig did not produce death, whereas, one cubic centimeter of a mixture of one part of water to five parts of bouillon, kept in the incubator over night at 37 degrees centigrade, proved invariably fatal to guinea pigs in a short time. Even subcutaneous injections of one guinea pig produced a fatal septicemia.

Q. Did you make any examination of samples of water received by you from Professor Long, taken from Lockport?

A. I received seven samples from Lockport, in which we found the following organisms:

Pathogenic.	
Bac. coli communis,	4 times
Bac. lactis aerogenes,	2
Bac. enteritidis,	1
7322 Proteus vulgaris,	2 times
Proteus mirabilis,	1
Non-pathogenic.	
M. candicans,	2 times
M. flavus liquefaciens,	1
M. luteus,	1
Sarc. lutea,	2
Sarc. aurantiaca,	1
Bac. subtilis,	1
Bac. mycoides,	1
Bac. aquatilis, sulcatus,	1
Bac. aquatilis,	1
Bac. acidi lactici,	2
Orange red water bac.,	1
Bac. cloacae,	1
Bac. ubiquitus,	2
Bac. rubidus,	1
Bac. plicatus,	1
Oidium lactis,	1
Mucor mucedo,	1

Q. State what examinations you made for the purpose of determining the character of these bacteria?

7323 A. Intraperitoneal injection of 4 cubic centimeters into guinea pigs produced no effect.

24 hours mixture grown at 37 degrees centigrade of one part of water and five parts of bouillon was uncertain in its effect. Some animals recovering after two cubic centimeters by intraperitoneal injection. One promptly died of sepsis. All those recovering had an elevated temperature and lost rapidly in weight for several days. One died two weeks later after having apparently recovered. No cause for death could be made out post mortem and no bacteria were found in the blood or organs nor in the abdominal cavity. In the animal which died promptly, the proteus forms were most prominent.

Q. State whether you received any samples of water during the period mentioned from Joliet, and what examinations were made, if any, to determine the character of the bacteria found therein?

A. We examined six samples of this water and found the following pathogenic and non-pathogenic bacteria:

Pathogenic.

Bac. coli communis,	3 times
Bac. entertidis,	2
Proteus vulgaris,	3

7324 Non-pathogenic.

Micro. aquatilis,	2 times
Micro. aerogenes,	2
Micro. luteus,	1
Sarcia lutea,	3
Bac. subtilis,	1
Bac. mycoides,	3
Bac. mesentericus,	1
Bac. aquatilis, sulcatus—I,	1
Bac. fluorescens liquefaciens,	1
Bac. cloacae,	2
Bac. superficilis,	2
Bac. fulvus,	1
Bac. plicatus,	2
Bac. rubidus,	1
Bac. mucormucedo,	1
Saccharomyces cerevisiae,	1
Bac. cyanogenus,	1

Intraperitoneal injection of four cubic centimeters into guinea pigs produced no effect. Of four guinea pigs inoculated with one cubic centimeter of the 24 hour culture at 37 degrees centigrade of one part of the different waters and five parts of the bouillon by intraperitoneal injection, one died of sepsis, the others recovered. 7325

Q. State whether any samples of water were received by you from Wilmington on the Kankakee river, during that period and if so, what examinations you made of such waters for the purpose of determining the character of the bacteria found?

MR. JEFFRIES: The specific objection is made to any testimony showing examinations of water made by this witness from samples taken in the Kankakee river at Wilmington, or at any other point, for the reason that it is incompetent, irrelevant and immaterial and has no bearing upon the issues involved in this case, and for the further reason that there is no evidence showing that any such samples were ever taken; that they were properly taken, or by whom taken, or in what quantities, at what places, or in what manner.

Q. JUDGE SPRINGER: Proceed.

A. We examined two specimens from this place and found no pathogenic bacteria, and the following non-pathogenic bacteria:

Bac. subtilis,
Bac. mycoides,
Bac. mesentericus,
Bac. aquatilis,
Bac. plicatus.

7326 Intraperitoneal injection of guinea pigs of four cubic centimeters of the water, as well as both the bouillon cultures proved non-pahtogenic.

Q. Did you receive any specimens of water during that period from Morris on the Illinois river, and if so, what examinations did you make of these samples of water for the purpose of determining the character of the bacteria found therein?

A. We examined ten specimens of water from this locality, and the following bacteria were found:

Pathogenic:

Bac. coli communis,	6 times
Proteus vulgaris,	4
Proteus mirabilis,	1
Bac. tetani,	1

Non-pathogenic.

Micro, candicans,	2 times
Sarcina lutea,	1
Sarcina rosea,	1
Bac. subtilis,	3
Bac. mycoides,	4
Bac. aquatilis,	3
Bac. cloacae,	1
Bac. megaterium,	2

7327 Bac, plicatus, 2 times

Direct intraperitoneal injection of one specimen of this water caused the death of a guinea pig in 11 days.

No post mortem findings or bacteria were found in the blood or organs of this animal. Other samples of water from the same place did not cause death by direct injection. Experiments with mixed cultures gave uncertain results, the animals sometimes dying and sometimes not.

Q. State whether you received any samples of water during that period from Ottawa or the Illinios river, and if so what examinations were made by you for the purpose of determining the character of the bacteria found therein?

A. We received five specimens of water from Ottawa. The pathogenic bacteria found were two:

Bacillus coli communis	2 times
Proteus vulgaris	1

Non pathogenic.

	Microc. aerogenes,	1
	Microc. candicans,	1
	Diploc. roseus,	1
	Bac. subtilis,	1
	Bac. mesentericus,	1
	Bac. clocae,	1
	Bac. liquiefaciens,	1
	Bac. fulvus,	1
7328	Vibrio flavus,	1
	Pink yeast,	1

Both the water and the mixed cultures proved non-virulent after intraperitoneal injections into guinea pigs in the same manner.

Q. Did you receive any samples of water from the Fox river at Ottawa during this period and if so, what examinations were made to determine the character of the bacteria found in such waters?

MR. JEFFRIES: The question is objected to for the same reason contained in the objection to the analyses of the water assumed to have been taken at Wilmington from the Kankakee.

A. We received four samples of water from Ottawa, Fox river, and found the coli communis, and the following non-pathogenic bacteria, which were identified:

Non-pathogenic.

	Diploc. citreus,	1 time
	Diploc. roseus,	1
	Sarcina lutea,	1
	Bac. mycoides,	1
	Bac. aquatilis sulcatus I,	1
	Bac. liquidus,	3
	Bac. aquatilis,	3
	Bac. flavocoriaceus,	1
7329	Bac. plicatus,	1
	Orange red water bac.,	1

Neither the water nor mixed cultures proved pathogenic to animals.

Q. Did you receive any samples of water from the Illinois river at LaSalle, and if so, what examinations were made to determine the character of the bacteria found in these waters?

A. Of the six samples we received, the organisms found were the following:

Pathogenic.

	Bac. coli communis,	2 times
	Bac. enteriditis,	2
	Proteus vulgaris,	3

Non-pathogenic.

	Microc. albicans,	1 time
	Sarcina lutea,	2
	Bac. mycoides,	3
	Bac. aquatilis sulcatus I,	3
	Bac. aquatilis,	2
	Bac. megaterium,	2
	Bac. fulvus,	1
	Bac. ochraceus,	1
	Bac. plicatus,	4
	Bac. subflavus,	1
7330	Bac. rubidus,	1
	Bac. cloacae,	1
	Oidium lactis,	1

Pink yeast,	1
Vibrio. aquatilis,	1

One guinea pig which received an intraperitoneal injection of four cubic centimeters of this water, died of sepsis, the others recovered, but the one to five bouillon mixture grown in the incubator for 24 hours, proved very virulent to guinea pigs.

Q. Did you receive any samples of water from the Illinois river at Henry, during this period, and if so, what examinations were made in reference to those waters?

A. We received and examined five samples from Henry, and found the following pathogenic and non-pathogenic bacteria:

Pathogenic.

Bacillus coli communis,	2 times
Proteus vulgaris,	1
Bac. tetani,	1
Staphylococcus pyogenes aureus,	1

Non-pathogenic.

Sarc. rosea,	1
Bac. subtilis,	1
Bac. mesentericus,	4
7331 Bac. cloacae,	1
Bac. megaterium,	1
Bac. aquatilis sulcatus I,	1
Bac. aquatilis,	2
Bac. subflavus,	2
Bac. rubefaciens,	1
Bac. striatus flavus,	1

Besides the above an organism like oospora farcinica was obtained again, but not positively identified.

Direct injection of the water did not cause death. Mixed bouillon cultures of 24 hours growth at 37 degrees centigrade were virulent.

Q. Did you receive any samples of water during that period from upper Peoria or a place sometimes called Averyville, and if so, what examinations were made of those waters?

A. We received five samples from this place. The pathogenic and non-pathogenic germs are as follows:

Pathogenic.

Bac. coli communis,

Non-pathogenic.

Microc. citreus,
Sarcina aurantiaca,
Sarcina rosea,
Saccharomyces cerevisiae,
7332 Pink yeast,
Bac. mesentericus,
Yellow water bacillus (Lustig),
Bac. liquidus.

Direct intraperitoneal injection of water as well as mixed 24 hours bouillon cultures proved entirely non-virulent. Even large doses of a 24 hour culture at 37 degrees centigrade of one part of water and five parts bouillon could be given to guinea pigs by intraperitoneal injection without causing death.

Q. State what evidences of bacterial self-purification are indicated by these examinations at this place, and the preceding examinations about which you have testified?

MR. JEFFRIES: We object to the question for the reason that the tables shown in evidence are incompetent as heretofore stated, and for the further reason that there were not a sufficient number of samples examined; the character and changes of the water with reference to flood times and winter season were not so followed as to enable any scientist to express any opinion as to the bacterial changes taking place in the water of the Illinois river at the point where these samples were taken, or at any other point. I object to the question for the further reason that the witness has not testified 7333 that he is acquainted with the bacterial organisms and the bacterial changes of river water and has not stated in evidence the extent of his experience upon that subject, if he has any.

JUDGE SPRINGER: I will ask the witness to state briefly what experience he has had in making such examinations before he answers the other question?

A. In examining water?

Q. Yes, generally speaking, now not with reference to these examinations.

A. I have taught classes in bacteriology for years how to find pathogenic bacteria in various mixtures and waters. My problem in this investigation was to determine the presence or the absence of pathogenic, that is disease producing bacteria, in the specimens of water presented to me.

As to experience, I have that of a teacher in bacteriology. I have taught bacteriology for 5 years, and while I have not an extended experience in sanitary investigations, I certainly have done enough work in the separation and identification of pathogenic bacteria, I think, to feel that I am entitled to an opinion as to whether they are present or not, and as to whether they disappear or not, and that is what I have done in this case.

7334 Q. (Question repeated):

MR. JEFFRIES: Now then, after the statement of the witness, I renew my objection, that he has not had sufficient experience with reference to the bacterial examination of running streams, knowing the bacterial changes of the water therein at all seasons of the year, at the various times in the year, particularly the relative conditions between winter and summer, flood times and low water stages, and the experience of the witness having been confined to the school room and the laboratory as stated by him, any opinion as to evidences of disappearance of bacteria from the water, is incompetent, ill-founded, of no probative force and of no value in the consideration and determination of the sanitary condition of the water in the Illinois river.

JUDGE SPRINGER: I submit that this objection goes to the weight of the evidence and not as to its competency.

MR. JEFFRIES: It goes to the whole weight of the evidence, and I suggest that from the witness' statement he has absolutely disqualified himself as being a competent witness upon the question propounded to him.

JUDGE SPRINGER: That of course is a question as to the weight of the evidence and not as to its competency.

Q. Proceed to answer the question, professor.

7335 A. I think I have distinctly stated in the beginning, that my part of this investigation was the finding and identification of pathogenic organisms, and such other sewage and water bacteria as could be identified, and I have, I think, qualified sufficiently in that direction.

MR. JEFFRIES: Now I object to the question for the further reason that the answer is not limited to the particular character of bacteria upon which the witness was making the examinations and which he was trying to ascertain.

Q. (Question repeated). Now proceed.

A. I found that there was a gradual decrease in the number as well as in the kind of pathogenic or disease producing bacteria in the water specimens submitted as we got further away from Chicago. Further, I found that bacteria that are generally known as sewage bacteria or saprophytic organisms gradually decrease as we approach Upper Peoria. The number as well as the kind of disease-producing bacteria, as well as the sewage bacteria, is continually decreasing to this point, and the absence of pathogenic effect in animals, I think is also a sufficient proof that the zone of bacterial self-purification, which every river has which has become polluted, must be located somewhere above or near Upper Peoria.

Q. State whether you received any samples of water from the Illinois river at a place called Lower Peoria—

7336 MR. JEFFRIES: I move to strike out the last answer for the reason that the witness's opinion is based solely upon samples analyzed by him without reference to knowing the particular place in the river from which they came, whether from the center, the side, or by cross-sections or otherwise; without reference to knowing the local conditions of the river and the water and the weather at the time the samples were taken, and further that his opinion thus formed is based only upon five samples taken in certain places, seven samples at other places, and eight samples at another place, and a few more samples at other places, so that the samples so examined by the witness are absolutely insufficient to enable any bacteriologist to determine the place in the river where self-purification from a bacterial standpoint, has taken place.

JUDGE SPRINGER: I would refer counsel to the testimony of Professor Long on this point, and other witnesses heretofore examined. The witness is called upon to state his conclusions in reference to the specimens examined by him during this period and the objection goes to the weight of his evidence and not as to its competency.

MR. JEFFRIES: I suggest that Professor Long absolutely refused to qualify as a bacteriologist, or to express any opinion in reference thereto.

7337 JUDGE SPRINGER: I know, but he stated the points from which these samples came at the time, the manner in which they were received, and in addition, that they were transmitted—that he transmitted those samples to Professor Zeit, and Professor Zeit states that he got these samples from him.

MR. JEFFRIES: Well, such facts have not been substantially proven in evidence, and the witness has stated that he only examined five samples at Henry, I believe, and probably six or seven at Upper Peoria—in fact less at Upper Peoria than at other places, and that based solely upon this proposition, upon this fact, this limited number of examinations, no bacteriologist can safely express an opinion as to the exact point in the river where bacterial purification has taken place.

JUDGE SPRINGER: That objection goes also to the weight of the evidence and not as to its competency.

7338 MR. JEFFRIES: I move to strike out the opinion of the witness and the statement of the witness that self-purification of bacteria had taken place at the point above Peoria, for the reason that he did not properly qualify as a sanitarian, as a bacteriological sanitarian, to make any such conclusions or determinations.

Q. JUDGE SPRINGER: State whether or not you received any samples of water from the Illinois river at a point near Peoria, and if so what examinations of these samples were made by you?

A. We received 11 samples of water from Lower Peoria, and found the following pathogenic organisms:

Bacilli coli communis,	8 times
Bac. lactis aerogenes,	2
Proteus vulgaris,	5

And the following non-pathogenic organisms:

Microc. aquatilis,	4 times
Microc. luteus,	1

A. We received ten samples from Pearl, finding the following pathogenic germs:

Bac. coli communis,	1
Proteus vulgaris,	1

And the following non-pathogenic germs:

Microc. candicans,	1
Microc. aquitilis,	1
Sarc. rosea,	1
Sarc. lutea,	1
Bac. subtilis,	3
Bac. mycoides,	5
Bac. mesentericus,	1
Bac. megaterium,	2
Bac. aquatilis sulcatus,	2
Bac. aquatilis,	4
Bac. aurantiacus,	1
Bac. rubidus,	1
Bac. acidi lactici,	1
Bac. flovocoriacens,	1

7343 Neither water nor culture, one to five, was pathogenic by intraperitoneal injection.

Q. State whether any samples of water were received from the Illinois river at Grafton, and if so how many and what examinations were made of these waters?

A. We examined ten specimens of water from Grafton, finding the following pathogenic germs:

Bac. coli communis,	2
Proteus vulgaris,	2
Staphylococcus pyogenes aureus,	1

And the following non-pathogenic:

Microc. luteus,	1
Microc. aquatilis,	1
Sarc. lutea,	2
Diploc. roseus,	1
Bac. subtilis,	5
Bac. mycoides,	2
Bac. megaterium,	3
Bac. aquatilis,	2
Bac. liquidus,	3

Bac. acidi lactici,	2
Bac. aurantiacus,	1
Bac. fluorescens liquefaciens,	2
Bac. subflavus,	1

Intraperitoneal injection of four cubic centimeters into guinea pigs did not prove fatal. Mixed cultures, one to five, were non-virulent.

7344 Q. Do the ordinary water bacteria multiply in river water?

A. They do.

Q. Do the pathogenic bacteria multiply in river water?

A. They do not.

Q. When the pathogenic bacteria and the ordinary water bacteria, and saprophytes all are present in river or lake water, what is their relative longevity?

MR. JEFFRIES: I object to the question for the reason that it confines the witness to the lake or the river and not to the samples of water taken from the lake and the river.

JUDGE SPRINGER: This question is general, but you may confine it to the Illinois river and drainage canal?

A. The conditions of the water bacteria are the same everywhere, that is, they will be able to grow and multiply even when there is very little organic matter present and even at a low temperature. The condition of growth of the saprophytic bacteria depends more or less on the presence or absence of dead organic material; the more organic material, the greater the number of saprophytic bacteria, and they usually require a somewhat higher temperature for rapid multiplication than do the water bacteria. In other words, the greatest multiplication of saprophytes will take place in the presence of the greatest quantity of organic material, and a tempera-
7345 ture slightly above that of the lake or river water. The existence or disappearance of disease producing bacteria, typhoid bacilli, the cholera vibrio, and various pus micro-organisms depends upon dilution, light, the temperature and the presence or absence of large numbers of saprophytes. Conditions exactly, as shown by experiments, are these: In the presence of many saprophytic bacteria, that is at a temperature at which saprophytes grow best, at room temperature, typhoid

bacilli, staphylococci, anthrax bacilli, and similar pathogenic bacteria are rapidly overgrown by the saprophytes and disappear from the mixture. Even in the absence of organic material where there are only water bacteria present, the water bacteria multiply also at a tremendous rate, and we find that the typhoid bacilli disappear in eight or ten days. In the first case, where many saprophytes are present, there is great multiplication of saprophytes at room temperature, and the typhoid bacilli are overgrown and disappear very much sooner, in five or six days. When there are only water bacteria and no colon bacilli, no sewage contamination, but simply the common water bacteria, as found at times in pure Lake Michigan, or non-
7346 polluted river water, the typhoid bacillus lives somewhat longer. If typhoid bacilli are put into a sterile water they can live still longer than in either one of the other cases. The typhoid bacillus in sterile water can live for weeks, even in the absence of food. These statements are all based on personal experiments, and I have repeatedly observed that in the presence of much organic material the greater the number of saprophytic bacteria, the sooner the cholera vibrio, staphylococci, anthrax and streptococci and typhoid bacilli will disappear. Another point which I ought to add here is, the higher the temperature, of course, the more favorable it is for the growth of the disease producing bacteria, and that in the low temperature of a river or lake water the typhoid bacillus can not multiply. These lower temperatures are favorable to the growth and multiplication of water bacteria and many saprophytic bacteria. The typhoid bacillus in the absence of many water bacteria and saprophytes might live for some time. The smaller the number of saprophytic bacteria which are present, the longer, of course, the typhoid bacilli may exist, and the less they will be overgrown by the rapidly multiplying saprophytes or sewage bacteria or water bacteria.

Q. You have spoken of three kinds of bacteria, ordinary water bacteria, saprophytes and pathogenic bacteria. Will you please state what meaning you attach to each of these genera?

A. Every lake and every river has a normal bacterio-
7347 logic flora. By water bacteria, I mean bacteria which do not cause putrefaction, which do not produce gas,

which do not produce indol, which can live even when there is little or no organic material present. They are organisms that are found in every water. By saprophytic bacteria or sewage bacteria I mean those which produce gas, cause putrefaction, coagulate milk, produce acids and so on, and require for their rapid multiplication organic material in a larger quantity, and a higher temperature than water bacteria. The water bacteria grow and multiply best at the temperature of the water; the sewage bacteria or saprophytic bacteria grow best at room temperature. The pathogenic bacteria are disease-producing bacteria and grow best at blood temperature, so that when the three are mixed, it is mainly a question of temperature as to which kind will multiply most. If you mix pathogenic germs and saprophytic bacteria and keep the mixture at blood temperature, the pathogenic germs will multiply more rapidly than the saprophytes; but if you keep them at the temperature of air, the saprophytic bacteria, in the presence of much organic material, will increase at a tremendous rate, whereas the disease producing organisms cannot multiply because the temperature will not allow them, and they are overgrown by the saprophytes. For instance, the typhoid bacillus doesn't multiply at all at the temperature of water.

7348 Q. Under what conditions will the typhoid bacillus multiply?

A. The typhoid bacillus will multiply only by being in a favorable temperature. It grows best at blood temperature, 37 degrees, but can grow at as low a temperature as 24 degrees.

Q. Is that centigrade?

A. 24 degrees centigrade. And secondly, there must be organic material for food. For a mixture with other rapidly growing bacteria at this temperature, the typhoid bacillus will be annihilated, it will be overgrown and it will disappear, even when the temperature is in the neighborhood of 24 to 30 degrees. The typhoid bacillus will disappear, due to the rapid growth of the other bacteria present.

Q. Professor, state whether at any time heretofore you made any experiments of tap water in Chicago, taken from the waters coming from Lake Michigan, for the purpose of ascertaining the longevity of the bacillus typhosus or other pathogenic germs?

A. I did.

Q. Please state the times if you can, and the circumstances of this examination, and what results you obtained?

A. Some five years ago, Professor Klebs suggested that I
test this question, and we at that time made a number of ex-
periments with common tap water. We took liter flasks, and
inoculated the liter flasks of hydrant water, of Lake Mich-
7349 igan water, with known quantities of a fresh 24 hour
bouillon culture of typhoid bacilli, the first flask receiving
one platinum loop full of the culture, the second five loops, the third ten, and so on, up to the last flask to which a whole tube full of bouillon culture, that is five cubic centimeters, of the typhoid bacillus was added. These experiments we ran in four series, so that there were ten of the one liter flasks in each series. One series was kept in the light at room temperature, the other set in the dark, room temperature; the third set in the dark at 37 degrees centigrade and the fourth set in the light at 37 degrees centigrade.

Q. Please state the temperatures Fahrenheit of those temperatures?

A. 37 degrees is about 98 and a half Fahrenheit.

Q. That is, 37 is 98½?

A. Yes, and 20 degrees centigrade is 68 Fahrenheit. We plated out daily and when we could no longer find typhoid bacilli we plated out as many as twenty plates from many of the flasks where we were unable to find them, and we found that the typhoid bacilli in all flasks, in all temperatures, disappeared, that is, in different times. If the temperature was most favorable to the growth of water bacteria, and in this par-
ticular instance I remember the most prominent in our speci-
mens were cocci, large water cocci. These increased at a
7350 tremendous rate. This was supposed to be as pure water
of Lake Michigan as we had at that time, and it did not
contain more than about 80 to 300 colonies to the cubic centimeter at that time. If we kept it at room temperature we found that the cocci increased at a tremendous rate even in a few days, and that the typhoid bacilli we had inoculated it with,

in all cases and in all flasks had died after three weeks. Now as to the time of disappearance of typhoid bacilli under different conditions, I have here a few of the data as to the time of disappearance. Those which we kept at blood temperature—

MR. JEFFRIES: What are you reading from?

A. I put some of the results of that experiment into the report made to the Illinois State Board of Health.

JUDGE SPRINGER: He is stating from memory now.

THE WITNESS: It is mostly from memory. I think I can give it entirely from memory, if you will give me a little time.

MR. JEFFRIES: Go ahead and read it, I don't care.

A. At blood temperature in diffuse day light and another set in the dark-room, we obtained colonies for probably two weeks, a little over two weeks—at room temperature in the dark we obtained colonies for ten days, but at room temperature in the light we obtained colonies for about eight days. We further added sewage, and later on made additional experiments under the same conditions just given, but the difficulty in distinguishing between the colon types and the typhoid bacilli was immense, and therefore these latter experiments were not as complete as those sets of four that I have
7351 mentioned with plain Lake Michigan water. We found that the typhoid bacilli disappeared very soon when sewage was added. In fact, much sooner. After five or six days we were unable to find typhoid bacilli in any water to which we had been adding sewage. I have before mentioned the difficulty met here, of not being as positive about the result as in the other case with lake water alone. We found mainly a rapid overgrowth of water cocci, whereas here we had the colon types in large numbers, and the great difficulty of separation and differentiation between these and typhoid types. We became thoroughly convinced from our work at the time, that typhoid bacilli, in the presence of much organic material and the overgrowth of saprophytic bacteria, disappeared entirely from the water inside of a week, that if only water bacteria were present and no sewage contamination, typhoid bacilli could live a somewhat longer time, but that no multiplication took place at the temperature of lake and river water and they

finally were annihilated. Whenever saprophytes were numerous the typhoid bacillus disappeared rapidly, that is in five or six days. Briefly stated, in the presence of water bacteria only, the typhoid bacillus can live a longer time than in the presence of much organic material and saprophytes, but in all cases it rapidly disappears from any water to which sewage is added.

7352 Q. Professor, which is the more important factor to be considered in determining the purity or impurity of a stream or body of water, the number of bacteria found in the water, or their character?

MR. JEFFRIES: Now I suggest to the Court, and object to the question for the reason that the witness has not qualified as a sanitarian and for the reason in his qualifications he did not state that he had any experience as to the sanitary condition of water, or with the condition of water in running streams from a hygienic standpoint.

A. The number of bacteria has not as much importance as the kind of bacteria. The number of water bacteria may be very great and have not much significance, whereas, if they are sewage bacteria and pathogenic or disease producing bacteria, the number may be very small, and the water might be called perfect, chemically, and yet it might not be called perfect bacteriologically. If we judge only according to the numbers of bacteria present, and the water contained less than 50 germs per cubic centimeter, it would of course have to be called a good water, and yet, if these fifty germs happened to be disease producing germs, that water should be condemned. The number has only significance in so far as after the normal number of bacteria in a stream or lake or river has been 7353 once determined in the summer and winter and at all times and under all conditions, a sudden great increase in the number found above that which is normally found under like conditions, would mean pollution. That would be the only value a numerical determination would have in my opinion. A judgment as to whether a water is good or bad, based upon the number of bacteria found in it, of course, is wrong. The quality of the germs, whether they are pathogenic or non-pathogenic, disease producing organisms is the essential point.

Also the question, if we are able to say so, whether the germs present are sewage or water bacteria.

Q. In the numerous bacterial examinations which you have made of the water of the drainage canal and the Illinois river as stated in your testimony in this case, have you ever found the bacillus typhosis?

MR. JEFFRIES: I object to the question as leading and incompetent for the reason that the witness has not made any extensive examinations of the water.

JUDGE SPRINGER: The question is confined to the examinations as made, extensive or otherwise.

Q. (Question repeated.)

A. I have not. Nor is that strange. We cannot find the
7354 typhoid bacillus usually because even if sewage contaminated with typhoid bacilli should get into the lake for instance, the dilution would be so tremendous, that it would be very difficult to find them again. The typhoid bacillus does not multiply at the low temperature of such water, and in case of sewage contamination of lake and river water the sewage and water bacteria overgrow it and other elements such as tremendous dilution and the effect of light, cause its disappearance. Even where we know that pollution of a water supply with sewage containing typhoid bacilli has taken place, bacteriologists cannot find typhoid bacilli. First the unfavorable temperature of water prevents multiplication of pathogenic germs. Secondly, sewage bacteria or saprophytes undergo rapid multiplication and overgrow the parasitic bacteria. Third, extensive dilution takes place and separates the bacilli so far that the bacteriologist is unable to find them any more. Another factor to be considered is that in most of the epidemics where bacteriologists have searched for typhoid bacilli and were unable to find them, the time of infection or of contamination has no doubt been passed by several weeks, and typhoid bacilli,
7355 which might have been found earlier, have been entirely annihilated during the period.

Q. If the typhoid bacillus was present in the water, would you in the examination of a cubic centimeter, determine that fact if it was in that cubic centimeter?

A. If one typhoid bacillus was present in one cubic centimeter?

Q. Yes?

A. I think with our present means of differentiating the typhoid bacillus, we would.

Q. What advantage or what assistance do you have in ascertaining the presence of these bacilli by the bouillon cultures to which you have referred?

A. I do not quite get your question.

Q. Would you recognize it directly or more readily by a bouillon culture?

A. The recognition of the typhoid bacillus from bouillon cultures taken from a specimen of water is impossible.

Q. You have stated that a 24 hour culture, at a certain temperature of one part of the water to five parts of the bouillon would produce a certain result?

A. Yes sir.

Q. What assistance does that afford you?

7356 A. The object of making, and enriching the culture in pathogenic bacteria or rather the object of infecting the bouillon with the suspected water, and exposing it to blood temperature is this: I want to favor the growth of disease producing bacteria, and with it of course also, the typhoid bacilli if they are present. They should multiply more rapidly than the saprophytic or water bacteria, and by having this culture in the incubator for 24 hours we keep back the sewage and water bacteria which do not grow so well at blood temperature as the disease producing bacteria. In this way we allow the disease producing bacteria or parasites to multiply more rapidly so that for 24 hours we are very liable to have favored and multiplied the disease producing bacteria, and to have kept back the others. In the water the conditions are just the opposite, due to its lower temperature, which keeps back the disease producing bacteria and favors the growth of the water bacteria and saprophytes or sewage bacteria. The injection of a 24 hour culture at blood temperature is liable to prove a great deal more pathogenic if disease producing bacteria were present in the water than if water itself had been injected. The injection of the water itself is very, very unsatisfactory, because if disease producing bacteria are present in the water itself, they are not in sufficient number to produce death or disease.

7357 Q. If there were then only one bacterium in the water as taken from the river or lake, this culture might produce a greater number?

A. If there was only one germ, we will say, of any pathogenic kind in four cubic centimeters of the water that I injected into the animal, that of course would have no effect on the animal at all, but after 24 hours in the incubator with bouillon, the one germ would have produced billions, and would certainly now prove virulent and produce disease or death.

Q. The presence then of one bacterium in four cubic centimeters of water, when it is intraperitoneally injected, would not produce any effect?

A. Even much greater quantities than that might not produce any virulent effect. It is but very rarely that a river or lake water that is injected intraperitoneally will cause death in a guinea pig. A few germs do not produce an infection even if they are virulent or pathogenic germs.

Q. Is that true of human beings as well as of the lower animals?

A. That is true in all cases, the number is just as essential as the presence of the germ itself, and as essential as the decreased resistant forces of the organisms, and as essential as the virulence of the germ. Those are really the four con-
7358 ditions of infection.

MR. JEFFRIES: I move to strike out the answer so far as the experiments made, for the reason that I take it this witness has not made any such experiments upon human beings, and I move to strike out the answer because the question assumes a fact not proven in the evidence, that is, that the question and answer assume a fact not proven in the evidence, and which cannot be proven except by actual experiments upon the two subject matters supporting the assumption, to-wit, animal life and the life of a human being.

JUDGE SPRINGER: Professor, you qualified as a pathologist?

A. Yes, sir.

Q. What is the accepted opinion of pathologists as to the probable effect of taking into the human system one bacterium of typhoid, or a single organism of any pathogenic kind?

A. It is true that in all diseases,—all infectious diseases, the number of the germs is very, very essential in producing an infection. We may have a germ and it may be virulent, and even the resistant forces of the organism may be decreased, and yet we have no effect, no infection, even in cases where there is a certain known source of infection, to which many people have been exposed. The same holds true not only of the typhoid bacillus, but of all other germs. We find that of the persons
7359 who die of other diseases, that ninety per cent. have evidences of an infection by tubercle bacilli somewhere in their bodies; I mean healed tubercular foci. Of those, then, infected by tubercle bacilli at some time during their life, 90 per cent. die from other causes, and show at the post mortem old foci, due to infection, which have healed. The numbers in all these cases have evidently been too small to cause death by tuberculosis, and the same also holds true with typhoid. The number of typhöid bacilli essential to produce infection, are not found in the amount of water usually used by an individual for drinking purposes, be it lake or river water. I do not believe personally that a direct infection can take place in such a manner. I think that if all the sewage of Chicago containing the typhoid bacilli from every case of typhoid fever in the city should get into Lake Michigan, that no one could be infected by the water of Lake Michigan *directly*, because the dilution of the bacilli and of such sewage, would be so great that one would have to swallow thousands of quarts of water to supply the necessary numbers of typhoid bacilli to produce typhoid fever, and that typhoid infections, in view of the fact that typhoid bacilli do not multiply at the low temperature of water, must take place in an *indirect* manner. To illustrate the infected water containing, we will say, one typhoid bacillus to so many thousands of gallons, would reach some favorable culture medium, like various food products, and in a favorable temperature, like that of a hot summer day, or in the house, in milk, or in oysters or on vegetables, or in various other foods, the few typhoid
7360 bacilli present begin to multiply and produce a pure culture in or upon these foods. A person partaking of such food, will swallow the necessary number of typhoid bacilli, to

bring about an infection and have typhoid fever, because he has swallowed a culture of many millions of typhoid bacilli, whereas, the other idea of the direct infection by drinking the water is illogical, when we consider the biology of the typhoid bacillus, and the tremendous dilution that takes place when turning sewage or other pollution into a large body of water, and the fact that the typhoid bacillus does not multiply at the low temperatures of lake or river waters.

Q. Assuming, Professor, that sewage and pathogenic bacteria gradually disappear in running water, what significance would you attach to this fact?

A. If the sewage gradually disappeared and with it the sewage bacteria, I would judge that by the overgrowth of saprophytes in the presence of organic material and a temperature favorable to rapid multiplication of saprophytes, pathogenic bacteria that might have been present in this mixture have been wiped out entirely. In other words, by the rapid multiplication of sewage bacteria, the disease producing bacteria which grow best at the temperature of the body, will be overgrown and 7361 perish, so that by the time the sewage bacteria and organic material has disappeared, the purification of the river or lake, of pathogenic bacteria, must be most complete.

Q. As a bacteriologist, what is your opinion as to the kinds of bacteria that have short vitality or longevity?

A. Pathogenic or non-pathogenic?

Q. Pathogenic.

A. That depends altogether upon the conditions and circumstances. The average germ can live under favorable conditions for weeks, but under unfavorable conditions it may die in a few days. That depends entirely upon the surrounding conditions and competition by other bacteria present.

Q. Assuming the conditions that ordinarily prevail in the Chicago drainage canal and the Illinois river, what would you say as to the relative longevity of the bacteria found therein?

MR. JEFFRIES: I object to the question for the reason that the witness has not made a sufficient number of examinations of the water of the Illinois river and the canal to testify on the subject and for the further reasons that his examinations have been made in water where pathogenic and non-pathogenic germs were prisoners, and not in their natural condition, and the

witness has not stated that the same operations bacteri-
7362 ologically take place in the river or streams in which these
examinations were made, as takes place in the bottles or receptacles, and therefore, any statement made by the witness on this proposition is incompetent, irrelevant and immaterial and has no bearing on this case, his experience going solely to the examination of the water for bacteria in the laboratory and not with reference to any observations of any stream, nor sanitary conditions of any streams.

Q. JUDGE SPRINGER: I desire to suggest in reference to this objection, that all of the examinations, with few exceptions, that have been introduced in evidence by the complainant and defendants were laboratory analyses or examinations.

MR. TODD: With the exception of the prodigiosus.

Q. (Question repeated.)

MR. JEFFRIES: I object to the question for the further reason that the witness has not stated or has not shown that he is acquainted with the conditions that existed in the Illinois river or canal; that he is not acquainted with the volume of water discharged into the Illinois river by means of the canal or into the Chicago river, and that he is not acquainted with the extent or amount of the pollution of the water that flows through the
Chicago river and canal, the Desplaines, and into the
7363 Illinois river, and therefore is incompetent to testify upon
that subject.

Q. JUDGE SPRINGER: Have you ever made any personal examinations or observations of the waters in the Chicago drainage canal and the Illinois river?

A. I have.

Q. State what they were?

A. I have been all over the territory from here to St. Louis.

Q. On the water?

A. And have seen the water and formed some opinions on this subject.

Q. How recently have you traveled over this region?

A. I have recently, about two weeks ago, something like that, gone over this whole region.

Q. Did you have occasion to observe the conditions that prevailed in these streams?

A. I did.

MR. JEFFRIES: I renew my objection to the question after the last statement of the witness, for the reason that he has stated that the question about which he is asked, depends upon the state of dilution, and that the witness has not obtained sufficient information as to the exact amount of water flowing through the drainage canal, the Desplaines river and down the Illinois river, nor has he been directed to con-
7364 sider the figures as to the amount of sewage pollution and other polluting matter entering the Chicago river, drainage canal and the Desplaines river, and that unless the witness has obtained these facts and was acquainted with them at the time of his ocular observation, any statement that he may make upon the subject is incompetent, irrelevant and of no probative force, and therefore illegal.

Q. Assuming the conditions that ordinarily prevail in the Chicago drainage canal, in the Illinois river, what would you say as to the relative longevity of the bacteria found therein?

A. I would like to separate those two a little, that is the drainage canal proper and the Illinois river. I think that in the drainage canal the growth and multiplication of immense numbers of saprophytes, due to the presence of a large quantity of organic material, is unfavorable to the life, the multiplication, or even the existence of disease producing bacteria. I believe that in the drainage canal the conditions must be such that they are gradually wiped out, whereas, in the Illinois river, the saprophytes are less numerous, and any disease producing bacteria that would enter the Illinois river, would be tremendously diluted, but they could probably exist longer in the Illinois river than they could in the drainage canal. Any disease producing bacteria that would get into the Illinois river could, on ac-
7365 count of the absence or the decrease in the number of saprophytic bacteria, live longer. The question could be answered by saying that in the drainage canal the existence or multiplication of pathogenic, disease-producing bacteria would be made impossible, and that they would disappear in such a sewage tank during the overgrowth of saprophytes.

Q. In how long a time?

A. The time, of course, would depend also upon the resistence of the organism, but under the conditions of my laboratory experiments, I would judge that a week ought to be sufficient to wipe out all the cholera vibrio, staphylococci and typhoid bacillus.

Adjourned until 2:00 p. m., the same day, Friday, October 2nd, 1903.

7366 2:00 p. m., Friday, October 2, 1903. Continuation pursuant to adjournment.

Present, the Commissioner and same counsel representing the respective parties.

PROF. F. ROBERT ZEIT,

resumed the stand for further direct-examination, by Judge Springer, and testified as follows:

Q. Professor, I call your attention to a pamphlet entitled "Illinois State Board of Health, Advance Sheets of Report of Sanitary Investigations of the Illinois, Mississippi and Missouri Rivers, 1902." Professor Long, in the testimony which he submitted in this case, stated that you had made some bacteriological examinations of the waters at the mouth of the Illinois river at Grafton, and at the mouth of the Mississippi river above the mouth of the Illinois river, and of the waters of the Missouri river above its confluence with the Mississippi. Please state whether the tables found in that pamphlet beginning on page 21 and ending on page 23, were prepared by you from samples of water furnished to you by Professor Long at the times stated in those tables?

MR. JEFFRIES: Now, we object to that part of the question which calls the witness' attention to the fact that 7367 Professor Long had testified to certain things. We object to the witness testifying from the pamphlet which he now has before him, and to which his attention has been called, by counsel, as being a certain pamphlet containing a preliminary report or advance sheet report of the Board of Health of the State of Illinois, for the reason that the original tables upon which the analyses of the water made by this witness were recorded, are the best evidence, and for the reason that such original tables are not before the Commissioner, and this witness, so as to give counsel an opportunity to cross-examine the witness as to the correctness of said tables, and that the table to which the witness has been referred is not the best evidence, and for the further reason that the samples so examined by this witness at the places mentioned here are so few in number that no opinion or conclusion as to the bacterial condition of the water in the rivers examined can be made, and no conditions obtained that would be reliable or trustworthy.

Q. (Question repeated).

A. They were.

Q. Please state when these investigations were made?

A. They were made between October 3rd, 1901, and March 11th, 1902.

7368 Q. Where were they made?

A. At my laboratory, Northwestern University Medical School.

Q. In what condition did you receive the waters in those samples at your laboratory?

A. Four ounce glass stoppered bottles, covered with rubber sheeting and tied with rubber strings.

Q. How were they sent to you?

A. They were sent to me in that form, immediately after they had been removed from the ice packed cases or boxes.

Q. How did they come to this city?

A. They came here ice-packed, as much as I know from those samples which I saw arrive at the college, some of them. I have not seen all of them arrive.

Q. They came by express, I presume?

A. By express, yes.

Q. They delivered them to your laboratory?

A. Delivered them at Professor Long's laboratory, and we got them from there.

Q. Are those laboratories near each other?

A. Yes, sir, they are. He is on the floor above me.

Q. Yes, the same building?

A. Yes.

7369 Q. So that when these samples came to Professor Long, the smaller bottles were delivered to you?

A. Were delivered to me.

Q. State how long after delivery to you was it, that you made your bacteriological examinations of the waters contained in them?

A. We plated out these waters always immediately upon receipt from Professor Long, and also after plating them out on gelatin and agar, we took the whole bottle—our technique differed somewhat here from that employed in the older examination. We took the whole bottle of water that was left and added to it nutritive bouillon and placed the whole bottle of water into the incubator, and then, 24 hours afterwards injected guinea pigs with one cubic centimeter of this water that had been kept in the incubator, intraperitoneally. The object was to remove the possible doubt of using too small a quantity of water in the growing of pathogenic bacteria, by using the whole bottle, adding nutritive bouillon to it, and then putting the whole bottle into the incubator. That favored the growth and multiplication of the pathogenic bacteria, and would thus enrich the water in any pathogenic bacteria that were present in the bottle
instead of only using one cubic centimeter from this bottle
7370 and cultivating that as we had done before.

Q. In other words, you favored the best opportunity for obtaining the greatest number?

A. We used all the water and made cultures from it, and the high incubator temperature was supposed to favor the growth and multiplication of disease producing bacteria and hold back the water bacteria.

Q. How many examinations of these waters were made by you and from what points?

A. We examined thirty-eight specimens of water from the Illinois river.

Q. At Grafton?

A. At Grafton. We examined 37 samples or specimens of water from the Mississippi river,—the mouth of the Mississippi river—

Q. You don't mean the mouth of the Mississippi river?

A. I do not know the exact place of collection of these waters.

Q. I mean you don't mean the mouth of the Mississippi river. That is at New Orleans, or below New Orleans.

A. No.

Q. You mean at the confluence of the Illinois with the Mississippi?

A. Yes. I am thinking so much now of the Illinois river, I make the usual mistake.

Q. Locate that place, the last place on the Mississippi 7371 river.

A. I don't know the place of collection on the Mississippi river.

Q. Where did the sample purport to come from?

A. The sample purported to be from some distance up the Mississippi river, before the Illinois river joined it.

MR. JEFFRIES: We move to strike out what the witness says with reference to what the sample purports to be, or from what point it purported to have been taken, and we object to the witness testifying further upon this proposition for the reason that he does not know the particular place in the river these samples came from and for the further reason that there is no evidence showing that these particular samples which he examined, were the identical samples that were collected from the various rivers, and at the various places, and sent to Professor Long, and there is no evidence showing that these samples were not collected at some other times and by other collectors than those who made the collections for Professor Long as shown in the evidence, and we object, therefore, to the witness further testifying upon this proposition, for the reason that the samples that he examined have not been properly indentified in evidence by this witness.

JUDGE SPRINGER: I submit that this witness is not 7372 called to identify them so far as the taking of the samples from the rivers is concerned. That Professor Long has stated in his testimony heretofore submitted in this case,—where these samples were obtained and the conditions under which they were obtained, and that is the evidence upon which we predicate the statements that are now going into the record.

MR. JEFFRIES: I submit that the witness has stated that he did not know from what particular points they came, and that in view of that fact, and not having followed the samples coming into Professor Long's hands, and from him to this witness, the testimony of this witness based upon those facts is incompetent.

Q. JUDGE SPRINGER: What means do you have of knowing the places from which these samples came?

A. The number of the specimen,—the fact that these specimens arrived by express in Professor Long's office; that he examined them chemically—the larger bottles, and that I received the smaller bottles which came in the same package, as his specimens did, convinced me that we evidently received the water from the same source.

MR. JEFFRIES: I still object to the testimony for the reason that the witness has not properly identified these samples, he being in this business, examining samples of water 7373 from day to day and from various sources; that there is no evidence showing that the samples concerning which he is now testifying were those that were collected in the manner testified to by Professor Long, and by the water carriers down the river, and at the places testified, and that the evidence taken heretofore shows that this witness has no information as to the exact place in the river where the samples were taken.

Q. JUDGE SPRINGER: State what information you obtained at the time you got these bottles, and as to the place from which they came, and from whom you obtained them?

A. In the first place I was not in charge of this water examination. Professor Long was in charge of the water examination and he asked me to do the bacteriological work for him, so, if there is to be any identification of specimens he ought to be the one to identify them. He is the one responsible for this water examination, and I simply did this bacteriological work for him.

Q. What numbers, if any, were upon the labels accompanying each bottle, and what did you do in regard to those numbers?

A. I took down the numbers which I found on those bottles, and which you will find in this report as to the bacteriological findings, and also the dates,—the dates and the numbers both were always given to me by Professor Long with the bottle.

7374 Q. Now, how many of these samples did you receive from the Missouri river, and from what point in the river?

A. I received thirty-six water specimens from the Missouri river, which were marked with the date and the number given in this report.

Q. Was there anything else on the bottle that indicated the place from which it came?

A. It did not always say from what river,—whether it came from the Mississippi or the Missouri or the Illinois, so very frequently we had nothing but the date and the number. We didn't even know whether it was the Missouri river or the Mississippi river, but after the completion of our work I obtained a list of the places by the number and date of the specimens examined and received from Professor Long. All of the specimens were numbered so we could easily refer to his record as to where they came from.

Q. Then at the time you made the bacterial examinations, you did not know whether it was Illinois river or Mississippi river or Missouri river water?

A. That was very frequently the case; we didn't know.

Q. State whether you tabulated the results of your examination in regard to each of these specimens?

A. I did, and when we were through with our investigation I had to assort all of these numbers according to Professor
7375 Long's record, to tabulate them under these headings: Illinois river, Mississippi river, Missouri river, because I had only findings of numbers, and only here and there as to what river it was.

MR. JEFFRIES: I move to strike out all that the witness has said with reference to the findings by the numbers, for the reason that he has not shown himself familiar with the manner in which the samples were collected; and the numbers, and with reference to whether it was serial numbers commencing with "1," covering all the rivers, or whether each river was numbered separately, by itself.

Q. JUDGE SPRINGER: State whether the tables found on pages 21, 22 and 23 of the pamphlet called "Advance Sheets," are those prepared by you at that time?

A. Yes.

MR. JEFFRIES: We object to the witness answering the question for the reasons that the original tables are the best evidence.

A. They are, I have them here.

Q. Bring them in.

A. I find I am mistaken, but I can have them here tomorrow. I still have them. Also in regard to the other water examinations if it is desired to have them. I have the original tables.

7376 Q. Did you prepare these tables from the originals in your office that you made yourself?

A. I did.

Q. Do the tables printed on pages 21, 22 and 23 of the "Advance Sheets," to which your attention has been called, contain a correct statement and a true statement of the results of your examinations of the waters indicated?

MR. JEFFRIES: Now, I object to the question for the reason that the witness says he has the original tables, and certainly under all rules of evidence, original tables are the best evidence, and that the witness should not be permitted to testify except from those original tables so long as they are in his possession.

JUDGE SPRINGER: I will get them here.

A. They do.

Q. Have you the original tables from which these were printed in your possession?

A. I have.

MR. TODD: I submit that original tables made by the witness are not original evidence in themselves, but a true and correct copy which correctly states the results of his analyses and sworn to by him, becomes original evidence, and competent in the case, even in the absence of any original memoranda 7377 which he may have made, so long as the tables which he swears to are true and correct tables of the results of his analyses.

MR. JEFFRIES: In response to counsel's statement, that the copy is evidence, I suggest that when the witness says he has the original tables in his possession, and without some showing being made as to inability to produce them, that counsel for complainant have the right to their production, in order that cross-examination may be based thereon, and I suggest also as this witness has stated that he did not know that the pamphlet which he now holds before him had been published, and not having seen the pamphlet until now, he cannot state that it is an exact copy of the original.

MR. TODD: In reply I will state that the original copies will be furnished to counsel before he begins his cross-examination of the witness, if he so elects, and will be offered in evidence if he requires it or requests it.

JUDGE SPRINGER: I was just about to state that we would put the originals in evidence, but if the counsel prefers the manuscript copy he can have it.

MR. JEFFRIES: I want to see the original when I can. I don't know whether I want to use them or not, but I would like to look at them.

JUDGE SPRINGER: I will furnish counsel for complainant tomorrow morning, with the original papers made by
7378 this witness, and he can have the benefit of those in the
cross-examination of this witness, and that in so far as there is any variation between the printed copy, if any should appear,—and the original, that the original copy be the evidence of the fact, and the table corrected accordingly.

MR. JEFFRIES: That is satisfactory so far as the tables themselves are concerned, but as to the competency of this witness and the conclusions he might make from these tables, I make no such arrangement.

MR. TODD: I would like to state right at this point, Mr. Jeffries, I am going to use printed copies of all my tables that have been compared by the witnesses who made the original tables. Now, if you want the original tables, why, I will get them here, and all other witnesses.

MR. JEFFRIES: I don't care about introducing the original tables.

MR. TODD: I will get copies of the printed tables, and they will be sworn to as being correct tables, and if you want the originals I will have them brought in. I don't mean this witness alone, but the others.

MR. JEFFRIES: I would like to have them brought in subject to our investigation, to look at them, just the same as
we did for you. Introduce them as exhibits for identifi-
7379 cation and you can withdraw them afterwards.

MR. TODD: These printed copies to be offered in evidence, and the originals will be submitted to counsel for his inspection, and if the objection is made that the original should be introduced in lieu of the printed ones, we will then introduce the originals in evidence.

JUDGE SPRINGER: Then under that statement we offer these now, and they can be printed afterwards. Let the first table be numbered Table No. 1, 1901-1902.

Q. Now, I will ask the witness to read Table No. 1 of the investigation of 1901-1902.

A. The table is as follows:

7380 No. 1.

38 Water Specimens from Illinois River.

Date of Collection	Number	Bac. Coli Communis	Proteus Vulgaris	Bac. Mycoides	Bac. Mesentericus	Bac. Megatorium	Bac. Subtilis	Bac. Liquidus	Bac. Enteritidis	Mic. Candicans	Other Micro-Organisms

7381 MR. JEFFRIES: We object to the reading of the table for the reason that the witness has not properly shown the particular place in the Illinois river where these samples were taken, whether from the mouth of the river, Peoria, La Salle or any other point. The witness from his statement does not know the particular place in the Illinois river where the samples were taken, and inasmuch as the witness has testified in his qualification that he has on various occasions examined the waters of rivers and performed bacteriological experiments in his laboratory, strict proof has not been given by this witness as to the correctness of the samples so set out in these tables, as being those received from Professor Long, and coming from any one particular place in the Illinois river.

JUDGE SPRINGER: I submit that Professor Long has stated with sufficient definiteness the facts concerning the taking of these samples and their delivery to Professor Zeit.

MR. JEFFRIES; I suggest here that there is no evidence showing that all of the 38 specimens of water that are contained in the table offered—this witness has shown no facts which authorize a conclusion or a belief that they came from any one particular place in the Illinois river, or from more than
7382 one place, or that these are the particular samples testified
to by Professor Long as coming from the Illinois river at its mouth at Grafton or at any other point.

Q. JUDGE SPRINGER: Professor, you may state now for the information of counsel again, all the facts which came to your knowledge in regard to the places from which the samples were taken, the examinations of which are set forth in this table?

A. Professor Long asked me if I would do for him the bacteriological work in the way of identification of pathogenic bacteria, and such other non-pathogenic bacteria as could easily be identified, such as water and sewage bacteria, from the water specimens which he would receive regularly from the Illinois river, the Missouri river and the Mississippi river.

Q. At what points?

A. The Illinois river at Grafton, the Missouri above its mouth, and the Mississippi some distance above the mouth of the Illinois. So when the examination was begun, the specimens were received by him. They were properly labeled with the date and with the number, and he turned them over with this date and number, to me. I knew that they were water specimens from one of those three places, and I simply identified them by the number that he gave them afterwards. These 7383 numbers that are in this report from 639 are *his* numbers, in his record book. He enters them and he receives them by the express company immediately upon its receipt, and with this number they are turned over to me, and when I report to him I report to him by the same number.

Q. Then the numbers in the first column after the dates?

A. Are Professor Long's numbers.

Q. And they were on each of those bottles?

A. They were on each of those bottles.

Q. And from those numbers?

A. The examination was always made and the report made upon that number of the specimen, and only at the end of our investigation when it was necessary to tabulate our findings did we have to go over these numbers and put all those together which came from the same place, and in that way these tables have resulted.

Q. Then from what you learned at the time, will you state whether the table which has just been put in evidence, the 38 water specimens from the Illinois river, was made from specimens of water taken from the Illinois river at its mouth, or at Grafton, above its mouth?

A. They were.

7384 Q. About how long after the dates here given of collection was it until you received the specimen and made your bacteriological examination thereof?

A. When the specimens were received, I don't know how long they had been on the way when they were received by Professor Long, but he immediately turned them over, when they arrived, to me.

Q. How long after that was it until you made your determinations?

A. Immediately. We plated out the water immediately and then added bouillon, and placing it in the incubator until the next day and then inoculated guinea pigs the next day.

Q. Professor, I see in this table, over the head line, "Bacillus coli communis," a certain mark,—a cross. Please explain what that cross means at the point indicated here where it occurs?

A. The cross means that that particular organism was found in the specimen of water whose number appears in the second column.

Q. And at what time was the collection taken?

A. The date given here represents the date that we received the specimen.

Q. October 15th?

A. Yes, sir.

7385 Q. State whether that is true in regard to the other crosses which appear in that table?

A. It is.

Q. Do those crosses indicate all the times at which the bacteria mentioned in the head lines were found in that specimen at that time?

A. No. The cross indicates not the time, but the fact that that particular organism was found in that specimen of water,—not the times it was found in that number, but that the germ was present in that particular specimen of water.

Q. And where there is no cross indicated, what are we to understand from the fact that there is a blank?

A. When there is a blank, the organism was not found in that specimen of water.

Q. Now, when do the times of collection on that column begin and end in this table?

A. It begins October 5th, 1901, and ends March 11th, 1902.

Q. State what is the significance of the wide column in the table, under the head of "Other Micro-organisms?"

A. Those were organisms which were but rarely found, and which received no special column therefor.

Q. Now, I call your attention to the table printed on page 22, which will be numbered Table No. 2, 1901-1902, of 37 7386 water specimens from the Mississippi river, and I will ask you to read that table?

A. Thirty-seven specimens from the Mississippi river, the examinations were begun October 8th, 1901, up to March 11th, 1902, and the table is as follows:

7387 No. 2.

37. *Water Specimens from Mississippi River.*

Date of Collection	Number	Bac. Coli Communis	Proteus Vulgaris	Bac. Mycoides	Bac. Mesentericus	Bac. Mergaterium	Bac. Subtilis	Bac. Liquidis	Bac. Enteritidis	Mic. Candicans	Other Micro-Organisms

7388 Q. Now then, please state what is to be understood by the crosses that appear in this table at many places?

A. The crosses indicate that the organism indicated at the top of the column, was found in that particular specimen of water. The absence of the crosses means that that particular germ was not found in that specimen of water.

Q. State whether the numbers in the second column after the dates there, represent the numbers upon the bottles which you examined?

A. Yes sir, they are Professor Long's numbers of identification.

Q. State whether these marks or crosses and their absence, indicate the results of all the examinations made of those waters?

A. From the Mississippi river?

Q. Yes, from the Mississippi river?

A. Yes sir.

Q. Above the mouth of the Illinois river?

A. Yes sir.

Q. I call your attention to page 23, which will be called table No. 3, 1901-1902, of 36 water specimens from the Missouri river. Will you read that table?

A. Thirty-six water specimens from the Missouri river which were examined between Oct. 10, 1901 and March 11, 1902, and the table is as follows:

7389

No. 3.

7390 Q. State whether the crosses which are seen here in this table have the same significance that the crosses do in the other tables to which you have referred?

A. They do.

Q. And their absence also?

A. And their absence also.

Q. State whether the numbers in the second column after the dates there, represent the numbers on the bottles containing the samples of water which you examined?

A. They do. They are Professor Long's numbers for identification.

MR. JEFFRIES: I move to strike out all the tables just introduced in evidence for the reasons stated in the objection to the introduction of the first table.

MR. TODD: Let me understand your objection, Mr. Jeffries. Is this objection to the tables offered, because they are not the originals?

MR. JEFFRIES: No.

MR. TODD: This objection does not go to the tables because they are not the original tables?

MR. JEFFRIES: No, it is understood that this objection does not go to these tables so far as their not being the original tables, provided the original tables be produced tomorrow for the inspection of counsel, and for cross-examination.

7391 Q. JUDGE SPRINGER: In your testimony today in reference to your examinations of waters of the Illinois river, you stated that the bacterial self-purification of the Illinois river began at Morris, and was practically completed between Henry and Upper Peoria?

A. Yes sir.

Q. Now state whether the results of the examinations to which you have just testified, strengthen or weaken those conclusions in regard to the water at Grafton?

MR. JEFFRIES: Now the first question and answer which is asked, I move to strike out, because the question is leading, and because it is a repetition and not proper direct-examination. The last question I object to for the reason that it is leading and argumentative, and for the further reason that the witness has already given testimony upon that proposition, and that whatever further conclusions may be drawn from these facts are argumentative upon the part of the witness, as well as upon the part of counsel in propounding the question. I object to the question as decidedly leading and suggestive and argumentative.

(Question and answer read).

MR. JEFFRIES: I suggest that it is not a proper question to ask the witness on direct-examination based upon 7392 the analyses he has given, and I object for the further reason that counsel has no right to assume that it would have any effect either one way or the other, or has no right to assume that any conclusions are to be drawn from the analyses of the water made by him of the Illinois river above Grafton.

JUDGE SPRINGER: I desire to assure counsel of my earnest desire to comply with his wishes, but I do not see how I can do it and get anything into this record.

Q. Now you may answer the question,—the latter question.

(Last question read).

MR. JEFFRIES: I object to the question for the reasons stated and I object to this witness giving any conclusions upon the bacteriological condition of the water in the Illinois river.

A. Bacteriologically I do not see any reason for changing the opinion expressed, that bacterial purification has taken place in the Illinois river long before the water reaches Grafton.

Q. What efforts did you make in these examinations for the purposes of the identification of pathogenic bacteria and for the purposes of determining the virulence of such bacteria?

MR. JEFFRIES: I object to the question for the reason that the witness has already stated in all of these exam- 7393 inations that he made no effort to discover the typhoid bacillus, which is one of the most important of the pathogenic germs found in running water and existing in running water. I submit that he has stated several times that he has made no efforts to find the bacillus typhosus.

MR. JEFFRIES: Repeat that question.

Q. (Question repeated).

MR. JEFFRIES: I object to the question for the further reason that the witness testified this forenoon that on account of the extreme pollution or diluting effect of river water in which pathogenic germs are discharged, and on account of the very small quantity of water examined in comparison with the entire volume of stream flow, that any observations that he may have made in this direction constitute no evidence and no reliance could be placed upon any conclusions that may be arrived at by him from the analyses made.

JUDGE SPRINGER: Answer the question.

A. I have plated out the suspected water and obtained pure colonies of the various organisms found, passed them through the usual cultures in order to identify them, and immediately after plating out, I have added to the suspected water enough bouillon, nutritive bouillon, to the four ounce bottle of the specimen of water to favor the growth of the bacteria therein, and incubated the whole bottle for 24 hours at 37 de-
7394 grees centigrade. After this time I injected one cubic
centimeter of this water, enriched in pathogenic or disease-producing bacteria, intraperitoneally, into Guinea pigs. When the animal died a complete bacteriological examination was held and the cause of death determined. Cultures were made from all the organs of the animal, particularly the blood, the spleen and the lymph glands and the contents of the abdominal cavity.

Q. How much water or how many cubic centimeters of water were actually charged with the bouillon for the purpose of obtaining these results?

A. 120 cubic centimeters usually.

Q. Of each sample?

A. Of each sample, that is four ounces.

Q. At each of the three places?

A. Of every water specimen, consisting of four ounces in a bottle, that is 120 cubic centimeters, and it was this that I incubated.

Q. You incubated the whole bottle?

A. Yes, I incubated the whole bottle. We also, in a number of instances, plated out afterwards this water, after it had been in the incubator for 24 hours. In fact we made a number of side experiments in order to arrive at a more cer-
7395 tain diagnosis of the pathogenic bacteria found there. We
also tried more modern means of precipitating typhoid

bacilli by agglutination, if there should be any and then enriching the water, using the serum of an immunized rabbit to agglutinate the typhoid bacilli, but these efforts to detect typhoid bacilli proved entirely unsuccessful and we dropped that again. In fact we never produced any precipitation, so we gave it up.

Q. Professor, if there had been one typhoid bacillus in one of these bottles, what would have been the effect of the cultures, the bouillon culture which you placed in the bottle in reproducing that bacillus into sufficient quantities to indicate the greater number per cubic centimeter?

A. There would have been millions of typhoid bacilli in 24 hours in this water in the incubator. In fact we have done that. We have taken some water specimens, other water specimens, not from these sources, and we have added minute quantities of typhoid bacilli to the water in the regular laboratory courses, and after incubating them for 24 hours, had them plated out and the colonies and cultures that looked like typhoid colonies were run through and tested as to whether they were typhoid bacilli. So, according to this method it seemed to me we were able yet to find typhoid bacilli even if there was one C. C. of bouillon culture to a million liters of water.

7396 Q. Please make that explanation a little clearer if you can professor, for the benefit of counsel?

A. If you take two milligrams of a suspension of a typhoid culture in sterile water and add it to a liter of common drinking water and keep the latter in an incubator for 24 hours, at a temperature of 37° C. you would enrich the typhoid bacilli and keep back the multiplication of the common water bacteria to such an extent that afterwards when you plated it out, after 24 hours, you find numerous colonies of typhoid bacilli, whereas at a low temperature that wouldn't take place because the water bacteria would overgrow the typhoid bacilli.

Q. What temperature did you use?

A. 37° C. blood temperature.

Q. That would be 98 Fahrenheit?

A. Yes sir. They would, even at this temperature of 37 C. after a while become less and less, but the first few days there would be a rapid multiplication at 37 centigrade, when some bouillon has been added to the suspected water.

Q. Now I understand you to say that if there had been one bacillus of typhoid fever in any one of these bottles, that in the whole contents of the bottle, you would have ascertained its presence by this method?

A. I would have thereby increased the number of typhoid bacilli to such an extent that they could easily be found.

7397 Q. So that the quantity you actually examined, the quantity of water you actually examined was enriched by culture of what might have been in the original if it had been there?

A. I inoculated the water with a known quantity, a very small quantity, and yet was able to find them afterwards by this enriching process. I want to add here that if such water was badly polluted with colon bacilli, the difficulty of finding them would be very great, and we would sometimes find it impossible to separate them because the colon bacilli would grow so much more rapidly than the typhoid bacilli, but in the average water specimen, such as we tried, we had no difficulty in finding colonies of typhoid bacilli in the regular laboratory experiments done by the students in their regular course of instruction.

Q. Then I understand you to say that if there had been in all the specimens examined by you, one bacillus typhosus that your experiments were sufficient to have demonstrated this fact?

A. I am of the opinion, that by this enriching process I should have succeeded in finding colonies of typhoid bacilli if one bacillus had been present in the water, although I, of course, repeat again that difficulties may arise in some specimens containing great numbers of colon bacilli.

7398 Q. Now you may state whether you in any of these investigations found the presence of the bacillus typhosus?

A. I did not. I found a number of other pathogenic bacteria.

Q. What were they?

A. The colon bacilli in the Illinois 13 times; in the Mississippi 19 times; in the Missouri 26 times.

MR. JEFFRIES: The same objection is made to the introduction of this table and to these statements, as was made to the
introduction of the tables of analyses offered by this wit-
7400 ness of the water taken from the Illinois river, the Mis-
sissippi river and the Missouri river.

Q. You may state whether during the spring of 1902 any other specimens were found?

A. During the spring we found great numbers of moulds, numerous spores of moulds, such as mucor, aspergillus, and oidium types in great numbers.

Q. Do the presence of these species of bacteria have any special signification, and if so, what?

A. I think they were mainly found in such great numbers on account of the entrance of surface waters into the river during the early spring.

Q. Do they bring to you any suggestion of sewage pollution?

A. I didn't think so much of sewage pollution then because it was spring and there was heavy precipitation all along the river during the spring and I think it is the common experience in all rivers during some parts of the year, particularly the early spring.—I looked this up at the time and found that it is common to find such an unusual increase of hyhpomycetes, or moulds during the spring in all rivers, also those which are not badly polluted with sewage or anything of that sort.

MR. JEFFRIES: I move to strike out the answer for the reason that the witness has limited his opinion to the spring time, that is, to the conditions existing in the spring time and not to the conditions existing from one end of the year to the 7401 other, witness has eliminated from his opinion and analyses the temperature of the water at the time the samples were taken and at the time the examinations were made, and for the further reason that those examinations do not show that they were made in the same temperature as that contained in the water at the time the samples were taken, so as to correctly describe and exhibit the true bacterial character of the water at that time.

JUDGE SPRINGER: I submit that the tags which were put in evidence in this case for identification contain the data as to the temperature of the air and water at the time each specimen was taken.

MR. JEFFRIES: I suggest that the analyses are not made in the same temperature.

JUDGE SPRINGER: Would the fact that the analyses for the purposes which you have indicated were made at a different temperature of the water affect the result materially of pathogenic bacteria?

A. The specimens we received were ice-packed. There could have been no multiplication of the pathogenic bacteria present. There might have been some growth of the water bacteria there, but there couldn't have been much growth of the sewage bacteria or saprophytic bacteria under those
7402 conditions, so I do not believe there could have been so very much difference.

MR. JEFFRIES: Then from the statement of the witness that there could have been no growth of any importance in the pathogenic bacteria or saprophitic bacteria, the samples being packed in ice, that the analyses of the witness from those samples testified to in this case, do not disclose nor display a correct bacteriological condition of the water in the Illinois river at all periods of the year. And for the further reason that the fact that the low temperature of the water during the time the samples were taken, or the high temperature of the water during the time the samples were taken necessarily mean an increased number or decreased number of pathogenic bacteria, if such bacteria existed in the samples when taken, and therefore a correct display and precipitation of the bacteriological condition of the Illinois river at all times of the year was not disclosed by the samples the witness examined.

JUDGE SPRINGER: Professor, will you state whether there would be any increase of the pathogenic bacteria known as typhoid bacillus, without the increase of temperature to 98 degrees Fahrenheit, and with the presence of bouillon culture?

7403 A. The typhoid bacillus can grow above 24 centigrade.

Q. What is that Fahrenheit?

A. Seventy-five. It grows best at 37 centigrade, that is 98 2-5 Fahrenheit. It multiplies best at blood temperature. It will not multiply below 20 centigrade or 68 Fahrenheit. It will not multiply in the absence of organic material. It will not die by freezing, and it will die at a temperature of 60 in ten minutes, 60 centigrade being equal to 140 Fahrenheit, which is in brief the maximum temperature. It can grow up to 42° C. which is 107 1-2 Fahrenheit, and will grow as low as 20° C. which is 68° Fahrenheit, at times. The optimum or most favorable temperature is 37° C., blood temperature. A typhoid bacillus dies at 140° Fahrenheit in ten minutes. Its most favorable temperature is 98 1-2° Fahrenheit. Its minimum temperature is 22° Centigrade or 71° Fahrenheit, and 107 1-2 Fahrenheit is the maximum.

Q. Will a typhoid bacillus multiply in river water with the aid of bouillon cultures?

A. It will not multiply at all in river water because the temperature is unfavorable.

Q. Then state whether under the conditions in which you received these samples of water, it were possible for there to have been any increase of the typhoid bacillus if there had
7404 been any present in the water, between the time of the packing of the sample and the making of the examination?

A. There would not have been any increase of typhoid bacilli.

Q. Assuming that the dejecta of typhoid fever patients in Chicago were deposited into the sewers of the city and were thence carried into the Chicago drainage canal and that the waters in that canal contained immense numbers of saprophytes and ordinary water bacteria, to the number of 70,000 of them and frequently as many as four million per cubic centimeter and assuming that it required at least 24 hours and as much as 48 hours for the water to pass from the Chicago sewers into the Chicago river and Drainage canal and Beartrap Dam, and assuming that the flow in the Desplaines and Illinois rivers is equal to forty miles in 24 hours. Under the conditions stated and from your own examinations of these waters and from your own experience as a bacteriologist, pathologist and bioligist, would in your opinion, such typhoid bacilli survive as far as Peoria?

MR. JEFFRIES: We object to the question for the reason that the witness has not made a sufficient number of bacteriological examinations of the water in the Chicago drainage canal or the Chicago river or the Desplaines river, and
7405 the Illinois river, to enable him to determine from such examinations, taking into consideration all seasons of the year, flood seasons, hot weather seasons and cold seasons, taking into consideration the time when the river is frozen over with ice and other local conditions, to enable him to express an opinion or form any conclusion as to the disappearance of

pathogenic germs or typhoid germs discharged from the sewers of Chicago into the Chicago river and the drainage canal, and for the further reason that the witness has not been able to determine the exact duration of the life of typhoid germs in a running stream, and for the further reason that the samples of the water taken from the canal are insufficient in number to determine whether or not the dilution is the same at all times, so as to enable him from the absence of all such substances as the witness says may destroy the typhoid germs, to prevent the passage of such germs from Chicago to the point mentioned in the question and for the reason that the witness is not acquainted or has not testified or given any opinion from the amount of sewage pollution entering the drainage canal and mixed with the water from Lake Michigan, and has not testified as to the amount and volume of such water so flowing through the canal at all times of the year, and for the further reason
that the witness has given no evidence and has testified
7406 to no evidence as to velocity of the river from the entrance
of the sewage into the Chicago river and the canal to the point mentioned in the question. That there is nothing in the question assumed, stating the time required for the water to flow from Chicago or the point of the sewage entrance into the canal, to the point designated in this case or designated in the question.

Q. (Question repeated).

MR. JEFFRIES: A further objection is made, that this witness has not qualified as a scientific bacteriological sanitarian and has not qualified as having thoroughly acquainted himself in any scientific way with the effect of sewage discharges in a running stream from a hygienic standpoint, and for these reasons, whatever conclusions the witness may draw will be speculative and imaginary.

MR. TODD: May I ask counsel to define what he means by a scientific, bacteriological sanitarian, as no witness of that character has yet testified in this case to my knowledge, so that it would be possible for defendants to remove the objection if the same is possible.

MR. JEFFRIES: I mean by that that the witness has not qualified as a sanitarian, and not having qualified as a

7407 sanitarian his bacteriological knowledge does not justify the assumption upon the part of counsel for respondents, or upon the part of the witness that he is a sanitarian.

A. In my opinion they would not for the reason that the saprophytic bacteria increase at such a tremendous rate in the drainage canal as to actually overgrow and annihilate any pathogenic or disease producing bacteria.

Q. JUDGE SPRINGER: Professor, knowing as you do the conditions that exist in the waters of the Chicago river, the drainage canal and the Illinois river and the Mississippi and Missouri rivers at their confluence, and taking into consideration the enormous dilution which the sewage passing through the drainage canal receives from Lake Michigan and from other sources on its way to the chain of rocks in the Mississippi river, is it possible in your opinion for typhoid bacilli deposited into a sewer in Chicago which empties into the Chicago river to survive the passage and enter the intake of the St. Louis Waterworks?

A. In my opinion it is not possible that they can reach there. I have stated before that my opinion is based upon the fact that whenever conditions are made favorable for the rapid multiplication of saprophytic bacteria, pathogenic bacteria disappear, and it is my opinion further that the reason why 7408 reputable bacteriologists have been unable to find the typhoid bacillus in the polluted supply of streams or localities where a typhoid epidemic existed, was due to the same cause.

MR. JEFFRIES: I move to strike out the question for the reason stated in my objection to the previous question and I move to strike out the answer because the witness has overlooked the fact that epidemiologists have attributed and it has become a scientific established fact that typhoid germs do pass from the sewers a long distance down the waters of running streams.

MR. TODD: I move to strike out that part of counsel's objection wherein he testified that it was a scientific, established fact that typhoid fever germs passed down stream, and also that part of his statement as to what epidemiologists hold as the defense in this case is not bound by the testimony of any so-called epidemiologist and not bound by any conclusions testified to by any expert calling himself by that title.

JUDGE SPRINGER: Professor, the table which you have read into evidence in this case already, which is found at the top of page 20 of the "Advance Sheets," state what conclusions you draw as a bacteriologist, pathologist and biologist as to the relative bacterial purity of the waters of the respective
7409 streams, at the points indicated in these examinations to which you have testified during the latter part of the year 1901 and the first part of the year 1902?

MR. JEFFRIES: I object to the question for the reason that the qualifications of the witness do not show that he is a competent witness to pass judgment or to form conclusions which would have probative force or be considered as competent testimony and for the reasons mentioned in the objection to the introduction of the table from which the witness is now called upon to base his conclusion, and for the reason that the witness is not a sanitarian.

Q. (Question repeated).

A. In regard to the bacteriologic flora of the three rivers at that time, from the investigations made as a bacteriologist, I would judge that the Missouri was more polluted than either the Mississippi or the Illinois during the periods of these examinations, and that the Mississippi was more polluted than the Illinois at the same time.

MR. JEFFRIES: Now we move to strike out the answer for the reason that the question does not call upon the witness to consider and the witness did not consider the amount of the sewage discharged into the various rivers mentioned or
7410 the population residing upon the water-shed of said rivers.

Q. JUDGE SPRINGER: Would your conclusion which you have just stated which was based on certain bacterial examinations made by you and to which you have testified be changed in any way by a consideration of the question of the amount of sewage that may have been deposited in any of these streams at any points above the places at which you made your investigation?

A. This investigation is entirely independent of any other

data. It is simply to determine, if the water of these three rivers, specimens of which were examined is to be condemned bacteriologically and which of the three is more dangerous than the other two, and I think bacteriologically and qualitatively that can be determined a great deal better in this way than by a great many of the methods that are employed sometimes as the more dependable methods by sanitarians. A physically pure water that contains a great number of pathogenic bacteria is certainly to be condemned. A water may be physically bad and contain a thousand times the number of bacteria that the other water contained and yet it may not contain any pathogenic bacteria. In spite of its apparent bad character physically it need not be condemned. I would be perfectly willing to swallow water, in which I was capable of producing a culture, like I have done here and keep it 24 hours in the incubator and inject it intraperitoneally into the abdominal cavity of a guinea pig, with-
7411 out any effect. After all, the question of determining the safety of drinking water from a river or a lake does not depend upon its physical character and the number of bacteria that may be present, but depends upon the number and kind of pathogenic bacteria present in the water. I testified as a medical bacteriologist, and I believe my opinion in this matter has some cause and some justice.

ADJOURNED until 10:00 A. M., following day, October 3, 1903.

10.00 A. M., Saturday, October 3rd, 1903.
7412 Continuation pursuant to adjournment.

Present, the Commissioner and same counsel representing the respective parties.

PROF. F. ROBERT ZEIT,

resumed the stand for further direct examination by Judge Springer and testified as follows:

Q. Professor, in your examination yesterday, you gave the bacterial results of certain examinations of lake water taken from the tap at your laboratory, for the purpose of ascertaining if possible the longevity of the typhoid bacillus. Four examinations were stated by you under different conditions. Will you please state in which of these experiments the conditions in your laboratory conformed most nearly, if at all, with the condition of the waters of the Chicago drainage canal?

MR. JEFFRIES: We object to the question for the reason that the examinations made by this witness of the tap water in the city of Chicago is not such as to make the temperature and condition of lake Michigan water, and the water in the canal comparable.

A. If there is to be any comparison, the only comparison
7413 that could be made, would be to say that the one nearest
conforming to conditions in the canal is of course the one with the lowest temperature. As to a comparison, we could say that the conditions for the disappearance of typhoid bacilli from the waters here were, if anything, more unfavorable than they would be in a water like the drainage canal, which is teeming with saprophytic bacteria. The Lake Michigan water was comparatively pure and therefore the typhoid bacillus had, if anything a better chance to exist there for a longer time than it would have in the drainage canal.

Q. If then in your opinion you had used the water from the drainage canal instead of from Lake Michigan, what would have been the probable longevity of the cultures of typhoid bacillus?

A. I made no experiments as to that, but I should judge that they would disappear sooner yet. The more saprophytic bacteria are present and the more favorable the temperature for these the sooner the disappearance of pathogenic bacteria in general.

Q. You stated, I believe yesterday, that those experiments disclosed a longevity of not exceeding five days, of that class?

A. No, in Lake Michigan water the shortest time was six days.

Q. Six days, yes. Then if the drainage canal water had
7414 been used in your opinion, the time would have been
shorter than this?

A. At least as short.

Q. Please state what relation there is, if any, between bacteriology and sanitation?

A. Well, I believe modern sanitation owes its advances mainly to the advances of bacteriology. Modern epidemiology and sanitary science has been entirely changed, as we have learned to know the etiology of infectious diseases, and their spread, so the modern sanitarian makes a specialty of applying that which we have learned from chemistry and bacteriology, and associated branches in the study of infectious diseases, as well as their prevention.

Q. What advantage if any, have the modern investigations by bacteriologists afforded to sanitation?

MR. JEFFRIES: I object to the question unless the witness qualifies as a sanitarian.

JUDGE SPRINGER: In answer to this objection I will say that the witness has stated that the sanitation receives its principal advantages or instruction from the knowledge of bacteriology.

MR. JEFFRIES: If it is to be so understood, that the witness has so stated, that the principal information of the
7415 sanitarian is derived from bacteriology, I move to strike
out the answer, for the reason that the witness has not qualified as a sanitarian.

JUDGE SPRINGER: Please read his answer.

(Answer read).

MR. JEFFRIES: I stand on my original motion to strike out the answer.

Q. (Last question read).

A. They have studied morphology and biology of bacteria, the etiology of disease, and determined in a great many of the infectious diseases the actual cause of the disease as well as the means of destroying that cause, and the modern bacteriologist bears about the same relation to the sanitarian, as the anatomist and physiologist or the chemist or the pathologist or the bacteriologist bears to the physician. The physician bases his knowledge upon the accumulated achievements of these other branches, and for the physician to deny the achievements of pathology or bacteriology or anatomy or chemistry would have about the same signficance as for the sanitarian to deny the achievements of the science of bacteriology in modern sanitary science. The whole knowledge of disease and the treatment of disease, has been entirely changed since the days of bacteriology,

and we may well say that modern medicine owes its greatest triumphs and advancement to bacteriology. When we know the cause of the disease, we can usually also destroy it or
7416 avoid it, or prevent it, and I think the bacteriologist has the right to claim, that this science has given to the medical man as well as to the sanitarian, the proofs of the factors which cause most of the infectious diseases. That is true in most of the infectious diseases. Not all of them have been determined yet. And I think just as soon as they are discovered by the bacteriologist, that the sanitarian will make use of it, just as he does now of other facts which have been brought out by the bacteriologist, and which he simply applies on a large scale in the prevention of epidemics and the spread of infectious diseases.

Q. You stated yesterday that you had graduated at a medical college?

A. Yes sir.

Q. What year was that?

A. 1887.

Q. About sixteen years ago?

A. Seventeen years ago, yes.

Q. Since that time what effect has the increased knowledge of bacteriology had upon the science of medicine?

A. We have learned to know the causes of many infectious diseases; we have learned to prevent and to cure infectious diseases by the employment of substances which either
7417 destroy the germ itself, or will destroy its poisonous products, as for instance in the case of diphtheria anti-toxin and in the use of tetanus anti-toxins. We have learned that some of the diseases that were supposed to be due to the effluvia of swamps like malaria and so on, are really infections caused by micro-organisms which are carried from man to man by intermediate hosts, such as mosquitoes and the like.

Q. What is the relative longevity, if you know, of the typhoid bacillus as compared with the bacillus prodigiosus?

A. I think the longevity of the two is quite similar.

Q. Which would have the greater longevity in your opinion, under the same conditions?

A. It depends entirely upon the conditions as to the longevity of the micro-organisms, whether it be a typhoid or prodigiosus bacillus.

Q. Assuming that they were in the waters of the Illinois river and the Illinois and Michigan canal?

MR. JEFFRIES: We object to the question unless the witness shows that he has examined and experimented upon the longevity of both germs in the waters of the Illinois river and the canal.

Q. (Question read).

7418 A. The longevity of the prodigiosus should be longer under those conditions than that of the typhoid bacillus, for this reason: The optimum temperature or the most favorable temperature for the bacillus prodigiosus is 25 degrees centigrade—

Q. What is that Fahrenheit?

A. 77 Fahrenheit. The optimum temperature of a typhoid bacillus is blood temperature,—98 Fahrenheit. Therefore the conditions for existence amongst other saprophytes are not more favorable to the prodigiosus than to the typhoid bacillus.

Q. How do you ascertain the presence of the prodigiosus in water?

A. We plate out the suspected water on agar or gelatin. The colonies are red when grown in the temperature of the air, which colonies liquefy gelatin, produce an odor of trimethylamin on potatoes and by microscopic examinations show a small organism about 1 to ½ microns long, and not quite one-half micron thick, which is slightly motile, which is non-pathogenic to animals, which has no spores, which produces no gas and which grows very poorly or not at all on bananas, although it grows very well on all other common culture media. It does not develop its red color when grown at blood temperature, and is then white instead of red. In air it produces a deep, bluish red, rich and glistening colony with sharp borders on 7419 potatoes, where it also produces this odor of trimethylamin most distinctly.

Q. What do you say as to the significance of the red color to which you have referred?

A. The significance of the red color is not so great that by it alone we could distinguish a prodigiosus colony.

Q. If while you are making an examination for the presence of the prodigiosus you should reach that point in your investigations where the red color appeared, and were to stop there, what value would that examination have for determining whether it was prodigiosus or some other bacteria?

A. We could not be certain by the color alone, whether we had a pridigiosus or some other red organism.

Q. Have you ever in any of your bacteriological examinations of the waters of Lake Michigan or the Chicago river or the Illinois river or the drainage canal, discovered the presence of the bacillus prodigiosus?

A. I have not.

Q. Have you discovered the presence of any bacillus which disclosed the red color to which you have referred? 7420

A. I did, in Lake Michigan.

Q. Please state the facts?

A. In Lake Michigan, in the early part of our work in 1900, we ocasionally obtained a few red colonies which appeared to have all the characteristics of a prodigiosus. This organism was different, however, from a prodigiosus, in the fact that it grew very well on sterilized banana slices, and the organism itself was larger than a prodigiosus commonly is, and it occasionally produced some gas. I was unable to find any germ like it described in the literature and I was very much inclined to call it a bacillus prodigiosus. We found this probably four or five times in the waters of Lake Michigan, and we did call it, for lack of a better name, the sealing wax organism because on agar it had the appearance of red sealing wax, whereas on other culture media it looked almost identical with the prodigiosus, also microscopically and morphologicaly it was similar, although larger.

Q. If you had rested your experiments on discovering the red appearance to which you refer, what would have been your conclusions as to whether it was a prodigiosus or not? 7421

A. Oh, I would have called it a prodigiosus. In fact I did at first.

Q. Professor, you stated on yesterday, that the zone of bacterial purification of the waters of the Illinois river had been reached as disclosed in your examinations of that river, at Averyville, just above Peoria. Will you please state what is considered by you and by bacteriologists generally, as the zone of bacterial purification of a river?

A. The zone of bacterial purification is that part of a sewage polluted river, where saprophytic organisms and pathogenic bacteria have disappeared and where the normal bacteriologic flora of the river, before it received such pollution, is again established. In other words, where practically the same bacteria are found or exist that are found in the same river before it receives such pollution. The zone of bacterial purification varies in the different localities and in the different cities that empty their sewage into rivers, in its distance between very short distances, as short as nine miles, and longer distances, to the extent usually of forty miles.

Q. Can you give any examples of other rivers where the zone of purification has been ascertained by bacteriologists?

A. Yes, I can. The river Seine in Paris has 70 kilometers below the city of Paris, after receiving all of the sewage
7422 of Paris, the same bacterial flora practically, having the same number of micro-organisms, that the river Seine had before it entered the city of Paris. This is a distance of 43 miles.

The river Oder at Breslau receives the sewage of the city of Breslau 32 kilometers below the city it has the same number of bacteria again that it had before it entered the city of Breslau.

In the city of Zurich, Switzerland, we have the lake sending out a river, the Limmat. The lake water contains only few bacteria to the cubic centimeter and is considered very pure—200 about, 100 to 200. The river receives all the sewage and the effluent of Zurich, and has again, 33 kilometers below the city, practically the same bacteriological flora as it had before receiving the sewage.

Q. How many miles would that be?

A. I see I made a mistake with regard to the distance. The Limmat had its zone of purification nine miles, or 14 kilometers from the source of pollution. If you care to hear the number of bacteria found at the different places, I have them here.

Q. 33 kilometers is how much?

A. 33 kilometers is the purification zone of the Isar, in Munich. 33 kilometers is about 20 miles.

7423 MR. JEFFRIES: Is that a historical fact that he is stating or is it an actual measurement made by the witness himself?

THE WITNESS: If you wish, I will give you the original communication, the data, so you can look them up yourself.

MR. JEFFRIES: If it is a historical fact I object to its going into the record.

MR. TODD: I submit that it is a scientifically established fact, acknowledged and received by the scientists of Europe as being established, as well as in this country.

MR. JEFFRIES: I suggest that this question of distances is not a scientific proposition.

JUDGE SPRINGER: He is translating kilometers into miles, which is a proper thing to do. It is a mere mathematical calculation.

Q. How many feet are in a kilometer?

A. 100 kilometers is about 62 miles, and it is on that scale that I am figuring out these distances.

Q. Now proceed, professor, if you have any other instances?

A. The Isar at Munich, in a distance of 20 miles, after receiving the sewage of the city of Munich, again—

MR. JEFFRIES: Before the witness reads any further,
7424 I want to know whether these measurements and distances were obtained by the witness himself, or whether they were obtained from some other source, I want to know the source of his information so I will have some grounds for objection if I see proper to object.

A. The Limmat in Zurich, the investigation was made by Schlatter—Zeitschrift fur Hygiene, page 56, volume 190, which is a journal on hygiene. The first I gave you, the River Seine. You will find in Rubner—Hygiene, Berlin.

The Oder you will find—I have not the data of that here, but you will find them also given in Frankland.

The Isar at Munich shows a zone bacterial purification which is complete 33 kilometers below the city of Munich, or twenty miles. This is given in Prausnitz,—Hygiene.

MR. JEFFRIES: When were these data compiled?

A. The Rubner in 1901; the Prausnitz is I think 1900 or 1901. I will bring them here so you can have them.

Q. JUDGE SPRINGER: They are in German, in the German language?

A. Yes sir. The Spree, in Berlin, also receives sewage which then allows the bacteria to raise up to 1,000,000 per cubic
millimeter. Then it goes into the small lake of Havel
7425 and at the exit of that lake, or Sacrow the bacteriological
flora is again the same as it was in the river Spree before it entered the city of Berlin. This is given also in the Zeitschrift fur Hygiene, page 355, volume 3.

Q. Do you know the width of that lake and its length?

A. I do not. It is a small lake, but I do not know its length nor its exact diameter.

Q. In Frankland's Micro-organisms, it is given as seven miles long. This lake is?

A. I should judge that the whole distance traveled was about nine miles, but I am not positive about this distance. I think nine miles would be a fair allowance.

Q. State whether the authors you have mentioned and to which you have referred are recognized authorities upon such subjects?

MR. JEFFRIES: We object to the question as immaterial.

A Rubner is Professor of Hygiene in Berlin. His textbook on hygiene is considered the standard book, and Prausnitz also is one of the standard text books; and the others quoted in the various journals also are considered good men. These determinations have been mainly made under the supervision of the government laboratory. The first work for instance, in Berlin was done by Koch the discoverer of the tubercle bacillus.
Some of these facts were already determined by Koch, be-
7426 fore these later publications which went into the question
much more thoroughly than had ever been done before.

MR. JEFFRIES: Now we move to strike out what the witness says with reference to the books from which he has read, being from standard authors on the subject, for the reason that the authors are not witnesses on the stand and we have no opportunity to cross-examine them.

Q. JUDGE SPRINGER: State whether the instances which you have cited are recognized by bacteriologists as a part of the accepted literature upon this subject.

A. I think this is mainly a question for sanitarians to consider and is not so much a question of pure bacteriology. This is a question of the application of bacteriology to hygiene, and these autherities I have mentioned, would no doubt be recognized by any sanitarian as well as bacteriologists, as competent and reliable.

Q. Returning then to your conclusions in reference to the zone of bacterial purification having been reached at Peoria, state whether the conditions which you took into consideration, and upon which you reach this conclusion are materially different from those existing elsewhere, where a similar conclusion has been reached as to other rivers?

7427 MR. JEFFRIES: We object to the question for the reason that it is ambiguous and misleading, and for the reason that the witness is not confined in his conclusions to personal observations taken by him, and without reference to the observations of others, and if it is intended to cover the observations of others, then we object to it for the reason that such other persons are not before the Commissioner for the purpose of testifying and therefore counsel have no opportunity to cross-examine them, and for the farther reason that any conclusions that the witness might make in this respect would be merely hearsay and of no probative force.

Q. (Last question read).

A. I think the zone of purification here ought to be even nearer to the city of Chicago, than what I have allowed. In fact, I think that the zone of purification is above Upper Peoria. I spoke of it simply there as being bacteriologically complete. I believe that the real zone of bacterial purification, is complete very soon after leaving the drainage canal.

7428 DIRECT-EXAMINATION,

By Mr. Todd.

Q. Professor, the samples of water which you examined or analyzed in both of these investigations you received directly from Professor Long, did you?

A. I did.

Q. Were those samples numbered when you got them from Professor Long?

A. They were numbered.

Q. And your analyses were based on these samples and your tables correctly indicate what the numbers signify and the places from which they were taken?

A. Yes sir. They did not always state as to the places from whence they were taken.

Q. I believe you stated that when the place was not on the sample you went to Professor Long, and with the number secured from him, the location?

A. Yes sir.

MR. JEFFRIES: I object to the question as leading.

Q. MR. TODD: What position does the science of bacteriology occupy in regard to the ascertainments of the purity of water?

7429 A. The bacteriologist can determine whether there are pathogenic bacteria present, whether the normal number of bacteria of a river has increased suddenly, and in that way might indicate a possible danger. He certainly is able to tell in a fair manner, whether a water is safe to drink.

Q. Is there any substantial difference between the demarkation of bacteriology and pathology and that which is denominated sanitary science?

A. Bacteriology has given rise to very great changes in both, in pathology as well as in sanitary science. Modern bacteriology has changed the views held in regard to the causative factors in infectious diseases, and also has given rise for proper preventative measures.

Q. Now in some of those examples which you have related in your last answer to the question put by Judge Springer as to the zone of purification in running streams, are those ex-samples recognized by the scientists of Europe as established scientific facts?

MR. JEFFRIES: Before the witness answers the question I want to know whether he is speaking as a bacteriologist, epidemiologist, etiologist or as a sanitarian and I object to the question for the reason that the witness has qualified for nothing save that of bacteriologist.

7430 MR. TODD: In reply I will state that in view of the diversified definitions that have been given by all the different witnesses who have testified in this case as to what epidemiology, sanitary engineering or any of the scientific terms which the witnesses in this case have applied to themselves, I leave that matter for counsel to draw his own conclusions from the testimony that has already been introduced.

MR. JEFFRIES: I suggest for the benefit of counsel that if he does not correctly understand the qualifications of this witness in reference to the extent and scope of his investigations and his experience. and with reference to his ability to pass judgment and give conclusions upon all these questions, that he re-open the examination and proceed now to qualify him the second time.

MR. TODD: Counsel in reply will state that he is amply able to take care of what he understands to be the qualifications of this witness.

Q. (Question repeated).

A. In my opinion they are.

Q. Professor, as an expert bacteriologist and pathologist, what is your opinion as to whether typhoid bacilli lying in the bed of streams for a period in excess of 60 days would be able to cause typhoid fever if taken into the human system, after it had remained in such sediment for that length of time? 7431

A. My opinion would be that it is dead by that time under those conditions.

Q. What is your opinion as an expert bacteriologist and pathologist as to whether or not a substance deposited on the bottom of the Illinois river between Chicago and Peoria coming from the sewage of Chicago through the drainage canal can remain there for a considerable length of time, and yet retain its dangerous qualities, as well as a pathogenic bacterium?

MR. JEFFRIES: I object to the question for the reason that the witness has shown no qualifications in that he has had no experience in investigating any such conditions.

MR. TODD: In reply will state that this witness has shown as much qualification as the epidemiologists on the side of the complainant who have testified to this state of facts without having made any examinations, chemically, bacteriologically or otherwise, but have expressed an opinion merely as the conclusions of the witness making them.

A. My opinion would be that the pathogenic bacteria would have died in the drainage canal, due to the great increase of saprophytic bacteria and the overgrowing of the pathogenic germs both in the sewers and the drainage canal. 7432

Q. MR. TODD: From your knowledge of the Illinois river and your experience as a bacteriologist and a pathologist, what is your opinion as to whether sewage deposited by the drainage canal from the city of Chicago into the Illinois river at different seasons of the year and at different stages of water in the Illinois river could possibly be an injury and menace to the citizens of the State of Missouri and the citzens of the city of St. Louis using the water of the Mississipi river at the intake tower at the chain of rocks?

MR. JEFFRIES: I object to the question for the same reason stated in the previous objection, that the witness has not qualified himself as a sanitary engineer.

A. As to the pathogenic bacteria it is my opinion there will be no source of danger to St. Louis or to the inhabitants of Missouri.

JUDGE SPRINGER: Using this water for drinking purposes?

A. Yes sir.

MR. TODD: From your bacteriological examinations of the water of the Illinois, Mississippi and Missouri rivers as represented by the tables you have submitted which one of these three rivers from your examinations discloses the least amount of impurities as manifested and evidenced by your bacteriological tests?

7433 MR. JEFFRIES: I object to the question for the reason that the samples of water so examined by this witness from the various rivers mentioned are not so taken as to be comparable and only a limited number were taken and not a sufficient number were taken to enable any bacteriologist or sanitarian to express an opinion ,as to the comparative conditions and relative conditions of the waters of the three rivers, and for the further reason that the examinations do not include flood times, low water seasons, nor do they include cold weather seasons and summer seasons.

MR. TODD: In reply I will state that the complainant's witness, Dr. George Whipple, drew conclusions from two samples taken in the Missouri river and three samples taken from the Mississippi river and that the objection of counsel goes to the weight of the evidence and not to its competency or its admissibility.

MR. JEFFRIES: In reply to counsel's suggestion, I submit that the statement made by complainant's witness Whipple was not based alone upon examinations made by him, but from his experience as a sanitarian, and not from purely laboratory tests as have been shown by the testimony of this witness.

(Question repeated).

A. From 38 specimens of the Illinois river, and 37 from the Mississippi river and 36 from the Missouri river made dur-
7434 ing the months of October, November and December, 1901 and February and March, 1902, I concluded that bacteriologically the Illinois river was less polluted than either the Mississippi or Missouri.

Q. If the Illinois river discloses the least amount of impurities, what would be the effect of the Illinois river emptying into the Mississippi river at Grafton and subsequently uniting with the Missouri river at its mouth, upon the combined waters of the Mississippi and Missouri rivers at the intake tower at the chain of rocks, and does the mixing of the Illinois river with the Mississippi and the Missouri rivers as indicated, add any danger to the already polluted waters of the Missouri and Mississippi rivers.

MR. JEFFRIES: I object to the question for the same reasons mentioned in the previous questions with reference to the qualifications of this witness and with reference to the irregularity in the number of samples taken and the irregularity in the time and season and weather conditions at which the samples were taken or during which the samples were taken.

Q. (Question repeated.)

A. I can only judge from the results of these tables, and if such a condition would exist and would have existed during this time it would have only tended to make the Missouri
7435 less infectious to add the water of the Illinois to it, because
the Illinois river was less infected than either the Mississippi or the Missouri. So during those times I would say that there would have been no source of danger to add the Illinois to the already severely polluted Mississippi or Missouri.

Q. MR. TODD: As an expert bacteriologist and pathologist, do you consider the sewage of Chicago entering the drainage canal and the Illinois river, which in turn empties into the Mississippi river, a menace and a danger to the inhabitants of the State of Missouri and to the citizens of the city of St. Louis taking their water supply from the intake tower at the chain of rocks in the Mississippi river?

MR. JEFFRIES: I object to the question as leading and for the same reasons heretofore mentioned that this witness is testifying from his analyses alone, and that a sufficient number of analyses were not made to make any determination whatever or to draw any conclusions whatever as to the sanitary condition of the water in the Illinois river and for the reason that this witness is not testifying as a sanitarian and for the further reason that the samples examined by him were not taken during all conditions of the water and the weather.

MR. TODD: In reply will state that this question is ad-
7436 dressed to him as an expert bacteriologist and pathologist.

JUDGE SPRINGER: I desire to submit further that his opinion based upon these examinations, the analysis to which he has referred is much more valuable than an opinion as based upon no examinations whatever of the same water.

A. I do not believe that the drainage canal or the sewage entering the drainage canal can be of any danger due to pathogenic bacteria remaining in it, to St. Louis or Missouri, for the

reasons already stated. My opinion being based mainly on the behavior of pathogenic bacteria in the presence of saprophytes and my opinion also being based on the general knowledge the world over of the existence of a bacterial zone of purification in any river, and a continuous and permanent purification as the river flows along. As it flows along new pollution occurs and new bacterial purification zones formed which is my reason for feeling certain that no pathogenic bacteria entering the sewers of Chicago or the drainage canal, will pass beyond Averyville, where bacterial purification was complete. This distance is much greater than that which is generally found the world over, in every river. I would have liked of course very much to have more material, make more examinations and to determine more positively the exact place of the bacterial purification,
7437 which I am quite certain is far above upper Peoria. I wanted to feel safe in saying that the absolute disposal of all pathogenic bacteria had been completed for the reason that even the saprophytic bacteria and the sewage bacteria have disappeared, and for the reason that, here, practically no bacterial pollution whatever of the river existed.

Q. Assume that an epidemic of Asiatic cholera should break out in the city of Chicago and the sewage of Chicago should enter the drainage canal and the Illinois river, what is your opinion as to whether or not the germs of Asiatic cholera would survive the journey from Chicago to the intake tower at chain of rocks, a distance of 357 miles, and be a menace and danger to the inhabitants of the city of St. Louis and the inhabitants of the State of Missouri?

MR. JEFFRIES: I object to the question for the same reasons stated in the previous objections and for the reason that the witness has not qualified as to his knowledge and information as to the life and characteristics and life history of the chlorea germs. I submit his answer will disclose that fact.

MR. TODD: That is a matter of cross-examination. If counsel has any doubt as to his knowledge of Asiatic
7438 cholera he may bring that out on cross-examination.
(Question repeated).

A. Practically the same conditions apply here that applied in the case of typhoid bacillus. They would be exposed to the same conditions and they would die due to the same causes, the overgrowth of saprophytic bacteria in the sewers and in the drainage canal and the zone of bacterial purification would exist just the same. The great pollution of the drainage canal by sewage bacteria and by saprophytic bacteria will be unfavorable to the existence of the cholera vibrio. The cholera vibrio cannot exist in a bed of saprophytes.

Q. Professor, from your knowledge as a bacteriologist, what is your opinion as to whether or not the germ of typhoid fever could lie in the sediment of the drainage canal or the Illinois river or the Mississippi river for a period of one to five years and still retain its virulence?

MR. JEFFRIES: I object to the question on the ground that the question assumes that sedimentation has taken place in the drainage canal and there is no evidence to show that sedimentation takes place in the main drainage canal and for the reason stated in previous objections to testimony of this 7439 character by this witness.

A. Of course I am thoroughly convinced that typhoid bacilli even under the most favorable conditions, would not live one year, much less five years.

Q. Do you know of any instance on record or in the literature on the subject of bacteria where typhoid bacilli have lived for a period of one to five years in the sediment of rivers?

A. I do not.

Q. Do you believe it possible for typhoid bacilli to be deposited on the bottom of the Illinois river and remain there for a period of one to five years and then be stirred up by the action of the waves, or by the wind or steamboats and by any other means, and continue its way down the river to St. Louis and be a cause of danger to the inhabitants of the State of Missouri and to the citizens of the city of St. Louis?

MR. JEFFRIES: I object to the question for the same reasons mentioned in the objection to the question previously put to the witness of this respect and of this character.

A. I don't think that is possible for the same reason, that I feel certain that typhoid bacilli would not live one year.

Q. MR. TODD: Professor, assume that 107 barrels of 40 gallons each of the culture of bacillus prodigiosus, consisting of one thousand million bacillus prodigosus per centi- 7440 meter is contained in said barrel, were deposited in the Chicago drainage canal at the town of Lemont on the afternoon and evening of the 6th day of November, 1901, during a period of from four to eight hours. Assume further that immediately after said barrels were emptied into the drainage canal at the point aforesaid, the laboratories established at Lockport, Joliet, Peoria and Grafton on the Illinois river and at the intake tower of the St. Louis waterworks at chain of rocks, were notified and that samples were collected at each of these places every hour day and night for the purpose of bacteriological analysis for the ascertainment of these bacilli prodigiosus, and assume that at Lockport these hourly samples taken day and night were taken from November 7th to 25th, during a period of eighteen days the total number of samples taken being 432 or thereabouts. Assume that at Joliet these hourly samples taken day and night were taken from November 7th to November 25th, a period of eighteen days, the total number of samples being 432. Assume that at Peoria these hourly samples were taken day and night from November 8th to November 30th, a period of 22 days, amounted to a total of 528. Assume that at Grafton these hourly samples were taken day and night from November 12th to December 15th, a period of 33 days, the total number amounting to 732, of which 384 were analyzed by Dr. Ravold; assume that the total number of samples taken hourly 7441 day and night at the chain of rocks was 720; assume that at the laboratory tap these hourly samples taken day and night were taken from November 20th to March 1st, 1902, a period of 100 days, amounting to the total of 2400; assume that the total number of samples analyzed at the different points for the period above mentioned were 5304; assume further that in the bacteriological test for the ascertainment of the prodigiosus, the red reaction on the medium used was the only test made for the ascertainment of the bacillus prodigiosus, and that the test was carried no further than that initial color of red, and assume further that on December the 4th at 8:45 A. M. o'clock one bacterium bacillus prodigiosus was found at the intake tower at the chain of rocks, based upon the red results as before indicated; assume on December 5th at 9:00 A. M. one

bacterium bacillus prodigiosus was found at the intake tower at the chain of rocks in the same manner; assume that on December 8th at midnight one bacterium bacillus prodigiosus was found at the intake tower at the chain of rocks in the same manner; assume that on December 6th at 8:00 A. M., at Grafton, one bacillus prodigiosus was found in the same manner; assume that on December 7th at midnight at Grafton one bacillus prodigiosus was found in the same manner, based upon the
7442 red coloring as above indicated, and assume further that these five organisms separated in the manner heretofore stated, were all the organisms of prodigiosus that were found in the examinations made from Lockport to the intake tower of the chain of rocks and the laboratory tap in the city of St. Louis which were made during the progress of this investigation as hereinbefore set forth, and at no time was there more than one single bacterium found at each of these places, assuming all the facts as hereinbefore stated to be true, what is your opinion as to the value of these experiments as indicating the probable longevity of the typhoid bacillus as measured by the longevity of the bacillus prodigiosus and the probability that the typhoid bacillus entering the drainage canal from the sewage of Chicago would survive the journey down the Illinois and the Mississippi river to the intake tower at the chain of rocks at St. Louis, based upon all the facts contained in the foregoing hypothetical question?

A. In the first place there would be some remarkable doubt whether the red colonies were really prodigiosus colonies. In the second place the great numbers that were poured into the canal and the practical absence of them afterwards would only illustrate what the self-purification of rivers means, because this germ grows best at room temperature. It would perhaps not die as easily in water as a typhoid bacillus, because it
7443 could probably exist better than a typhoid bacillus under those conditions, and I think it would prove that if it is true that the prodigiosus disappears under such conditions, that it would be much more true of the typhoid bacillus.

Q. Professor, in order to establish to an absolute certainty that the germs denominated as bacillus prodigiosus were found at the places indicated in the last hypothetical question, would it be necessary on the part of a bacteriologist to establish their identity beyond all question?

A. It would be necessary to pass the germs through different culture media and it would be necessary that this germ conform to the description as given in the literature in order to name it a bacillus prodigiosus.

Q. Would the examination as far as its assumption in the hypothetical question, is concerned, enable the bacteriologist to establish to a certainity that the germ that gave red coloring matter as idicated, was a prodigiosus bacillus?

A. No. It cannot be distinguished by the color alone.

CROSS-EXAMINATION,

By Mr. Jeffries.

Q. Professor, do you know how long a time elapsed between the collection of these samples that you examined and the actual examination which you made, took place?

7444 A. I do not.

Q. You do not know whether it was one day or two days or ten days?

A. I know that the specimens were shipped by express to Professor Long and that they were sent to me at my laboratory on the day that they arrived. In fact some of them I saw arrive and I received them at once, but as to how long before they reached the college, they were under way, I have no knowledge.

Q. Did any of them remain in Professor Long's laboratory over night before you received them?

A. No.

Q. Do you know of your own knowledge that they did not?

A. I answered the former question by my own knowledge. If this happened it happened without my own knowledge.

Q. You do not know of your own knowledge that none of them did not remain over night?

A. No sir.

Q. In making these anlayses did you make any allowance for the time that it required the samples to get from the place of taking to your laboratory?

A. I did not.

Q. Can you state whether or not this time allowed changes
7445 to take place which would vitiate the result?

A. There must be changes if a considerable time elapsed between the collection of the specimens of water and the time it is plated out.

Q. Was the ice packed around these samples in the winter time as well as in the summer time?

A. The ice packing was used in winter also, as much as I remember; the specimens arrived by express and went to Professor Long. I only saw some of them arrive. I received them in four ounce bottles when they were not any more ice packed.

Q. They were not packed in ice when you received them?

A. They were not packed in ice when I received them from Prof. Long, no sir. Those I did see, I just saw accidentally in his laboratory after they arrived.

Q. Now then, how far is your laboratory from his?

A. My laboratory is on the floor below. At that time it was on the same floor. In 1900 it was on the same floor.

Q. How many feet apart?

A. Oh, about fifteen feet.

Q. Did you go into his laboratory and get the samples or would he bring them in to you?

7446 A. He would send them in.

Q. Now you do not know how long they had been removed from the ice when they were sent in?

A. No, except some that, as I have said, I saw arrive and saw packed in ice afterwards, coming to my laboratory.

Q. Now that would have some effect upon the results, wouldn't it and upon the bacterial changes in the water?

A. What's that?

Q. From the time they were taken out of the ice until you received them and they underwent the bacterial examination?

A. I think the time was too brief there for much change to take place.

Q. That is in relation to the samples that you took yourself, that you went to Professor Long's laboratory and got yourself, but now in the event some of these samples were taken from the ice and laid aside for a while, that would invariably according to the extent of time have some effect upon the bacterial change in the water wouldn't it?

A. If they were unpacked from the ice and allowed to stand in the room there would be changes.

Q. And those changes would vary with the temperature of the room?

A. They would vary according to the temperature of the
7447 room and according to the organisms that happened to
be in the water?

JUDGE SPRINGER: Do you refer in your question to the pathogenic or the non-pathogenic?

MR. JEFFRIES: I refer to both.

JUDGE SPRINGER: Answer as to both.

THE WITNESS: I did; I said it would depend upon the bacteria, the temperature and the kind of bacteria present.

MR. JEFFRIES: There is no distinction made there in that connection between the pathogenic and non-pathogenic?

A. Yes, the temperature would have influence in varying the result. If a specimen of water was ice packed and was sent to some distance there would already be some changes; then if it was unpacked and allowed to stand for some time, then the changes would depend first upon the temperature existing there, secondly upon the kind of organisms present and thirdly upon the number of the indivdual organisms present.

Q. I understand that but that applies both to the various kinds, pathogenic and non-pathogenic, doesn't it?

A. That refers to both.

Q. That is the way I understood it.

A. Yes, but we take it that they would be present, and it
would depend upon the temperature and the numbers of each
kind in the mixture as to what changes really could take
7448 place.

Q. Why did you use ice in sending your samples from the place of taking to the laboratory?

A. To preserve the conditions as nearly like those in the river as it could be done.

Q. That is, the ice tends to prevent the multiplication of the bacteria?

A. Yes sir.

Q. Does it tend to prevent their death?

A. Ice usually, does not kill bacteria, although the ice packing is not the best way of doing nor sending bacteria from long distances. I try to get them as nearly like their normal condition. The temperature should be as nearly like the temperature of the water as possible.

Q. Do you know, professor, what the effect of the sealing of the bottle would have upon the life and death of the bacteria in the bottle as compared with the life and death of the bacteria in the canal water?

A. The sealing could, for the short time that they were sealed, not have so much effect, whereas, if that existed for a long time it would have some effect. The aerobes which require oxygen would find enough there for some time so that the effect of sealing couldn't be very marked.

Q. The effect of ice then was to hold the water in such a condition as to prevent the growth and prevent the death
7449 of the bacteria?

A. Yes, it was to prevent the growth of one kind at the expense of another kind.

Q. Professor, what experiments have you made with reference to the life of the typhoid germ?

A. I have inoculated liter flasks with known quantities of the typhoid bacillus in lake water, into the Missouri river water, into the Mississippi water and into the Illinois river water.

Q. Now all these experiments were made at a temperature ranging from 20 to 37 degrees centigrade?

A. No; some were made at twelve degrees. Those of the river water at Grafton, the Illinois river water, and the Mississippi and Missouri were made at a temperature varying between ten and twelve degrees centigrade in the refrigerator.

Q. Those are the experiments on the life of typhoid germs, are they?

A. Yes sir.

Q. Did you describe those yesterday?

A. I did not; I was not asked it.

Q. How long did they live professor?

A. At that temperature I was not able to find a typhoid
7450 in five days and in six days.

Q. At what temperature?

A. Ten to twelve centigrade.

Q. How were they made?

A. The river water was inoculated with different quantities of 24 hour bouillon culture of typhoid bacilli, and placed into the refrigerator. The water was then daily plated out on agar, in a number of dilutions. As many as fifteen to twenty plates were made; then we would take the plate which had the most distinct colonies, and mark all the suspicious colonies that looked like typhoid. Then we would examine these colonies, whether it was a bacillus and if so, whether the bacillus was motile. If it was a motile bacillus then we would use the serum of an immunized rabbit, or we would use the blood of a typhoid fever patient to obtain a Widal reaction; then we would make a potato culture; we would grow it in glucosebouillon too for absence of gas production and we would make a test for indol, but we were usually satisfied in our work when we found a positive serum reaction that we had found the typhoid bacillus. In all cases when we were not able to get such a reaction, we made the usual cultures of the supicious motile bacilli. The first point was always 7451 to look for suspicious colonies; the next point, whether it was a bacillus; otherwise that colony was thrown out. If it was a bacillus, it would have to be motile; otherwise that was thrown out, and in that way with the help of pure cultures we were able to tell that the typhoid bacilli disappeared in 5 to 6 days. There was an increase sometimes, in the numbers of typhoid bacilli during the first days. I thought, when the temperature of the laboratory had varied a little bit, but under all conditions we were unable to find colonies of typhoid bacilli in this river water after six days, even in those experiments where we had inoculated large quantities of bouillon culture into it.

Q. Now in what particular water was that done?

A. It was done with all three and it was done during the time of these investigations. The water was in four ounce specimens.

Q. And it came from where?

A. With specimens from the Illinois river at Grafton, the

Missouri above its mouth and the Mississippi before the Illinois enters it.

Q. You didn't take a sample of the Mississippi after it received both the Illinois and the Missouri?

A. No sir, I did not.

Q. Did you have two samples from each source?

A. No, we had many samples; we examined 38 about from each river.

Q. I am talking about one particular day did you have more than one sample for any one particular day?

A. No sir.

7452 Q. Did you use these samples for these tests?

A. Partly.

Q. Now in your testimony yesterday I believe you stated that you examined these samples for typhoid by another process?

A. Yes, we made other experiments from each river. There were 36, 37 or 38 speimens from each river and we did not use all the water in a bottle or specimen when we made a test as to how long the typhoid bacillus would remain alive in it.

Q. You did not use all the water that came in one of those bottles to determine whether or not it contained pathogenic bacteria or not?

A. No sir.

Q. I understood you to say yesterday that you did?

A. No, that was only for animal experiments and only in some the cases where we did not inoculate typhoid bacilli into the water specimen.

Q. So that in these examinations of the water that you have made in the Illinois river the canal and the other places, you did not use all of the water in the four ounce bottles that you received to determine whether or not any pathogenic germs were contained in that water, in the whole volume of water sent you?

A. We did that in no cases, in none of the examinations.

The only times when I used all of the water was when 7453 we made animal experiments. After we had plated out the water which was received in the laboratory, and for which plating we used only a small quantity, we would add nutritive bouillon to the water and place the whole bottle in the incubator for 24 hours and then inject guinea pigs.

Q. I understand that.

A. And then if the plates which were grown from these small quantities, showed large numbers of pathogenic bacteria and the number of colonies was very great, we would inoculate one cubic centimeter of this water, which had been in the incubator with bouillon, intraperitoneally into a guinea pig.

Q. How many samples of Illinois river water did you test that way?

A. Thirty-eight.

Q. Now did you test all these 38 on animals?

A. We did not.

Q. I want to know how many you tested on animals?

A. Six.

Q. With what results?

A. The results were that the animals usually died of proteus infection, but not always.

7454 Q. Now going back professor to these typhoid experiments, what did you say was the temperature of the water?

A. Between ten and twelve degrees centigrade in the refrigerator.

JUDGE SPRINGER: What is that Fahrenheit?

A. 50 to 53. This was in the refrigerator; the temperature may have varied a little sometimes.

Q. MR. JEFFRIES: Now then professor, as the temperature decreases the life of the typhoid increases, doesn't it? In other words do you know whether the typhoid will live longer at a low temperature than it will at a high temperature?

A. The cause of the earlier death here is the overgrowth of saprophytic bacteria that grow best at a low temperature. That is the cause of their disappearance.

Q. Have you made any examination of this water with reference to the various changes of the life of typhoid germs in the water?

A. No.

Q. At various temperatures?

A. I have only experimented with this water in the refrigerator, inoculating known quantities of typhoid bacillus.

Q. At this one time?

A. At several times during this investigation.

Q. But at no place more than one time?

A. No one day more than one time.

7455 Q. And the whole investigation was how many times at any one place?

A. At any one place for the life of the typhoid bacillus in river water?

Q. In that water, yes.

A. I should think that we did not more than ten tests, that would be about three for each water.

Q. At what temperature?

A. All these experiments were done in a refrigerator.

Q. How long did they live?

A. They lived no longer than six days. Sometimes after four days we were unable to find any colonies of typhoid baccilli.

Q. Can you produce a table, produce examinations showing the number of typhoid bacteria in each bottle each day?

A. No.

Q. And the total number of bacteria?

A. No, I have never attempted either to count the total number of bacteria nor have I attempted to make a count of the typhoid colonies that appeared.

Q. If the samples can be prevented from changing by ice, is it not a mathematical conclusion that when a river water is at the temperature of ice as it is in the coldest part of the year that it would be correspondingly protected from changes in composition?

7456 A. Yes, I think that is true.

Q. Your experiments made at a temperature of 12 and 20 centigrade, would throw no light upon the life of the germ with temperatures at the freezing point, would they?

A. No, they would not. If it was at the freezing point, there would be no increase of saprophytes, so in the frozen specimens, both the saprophytes as well as the typhoid bacilli would probably remain as they are in the ice.

Q. Increase of the saprophytes would be measured as you approach the freezing point; that is, the decreasing number would be measured as you approach the freezing point, isn't that true?

A. As the temperature becomes lower than that of air and water the saprophytes would increase less and less.

7457 Q. State how much organic matter was contained in the water in which your experiments on the life of typhoid germs was made, first now, in the aggregate. In other words, the amount of aggregate organic matter?

A. I can not state the amount of organic matter that was present. We used Lake Michigan water in the first experiments and we used river water in the other experiments, and the question was simply in regard to the life of the typhoid bacillus in the presence of saprophytes as they were found under usual conditions at the time, and I have never made any determinations as to how much organic matter was present in either the Lake Michigan or the river water.

Q. Now professor, state the amount of organic matter coming from the bouillon containing the culture of bacteria?

A. That was very little. Besides 3-10 per cent of meat extract, my bouillon contained one per cent of peptone and one-half a per cent. of salt.

ADJOURNED until 2:00 p. m. same day.

7458 2:00 p. m., Saturday, October 3, 1903.

Continuation pursuant to adjournment. Present, the Commissioner and same counsel representing the respective parties.

PROF. F. ROBERT ZEIT,

resumed the stand for further cross-examination by Mr. Jeffries, and testified as follows:

Q. Professor, were analyses made to determine the amount of organic matter contained in the water in which your experiments on the life of typhoid germs was made, and the aggregate amount of organic matter coming from the bouillon contained in the culture of the bacteria?

A. No.

Q. Professor, I will ask you if it is not a fact that the smallest amount of bouillon adds a large percentage to the organic matter of the water?

A. A large percentage? I don't think it would add such a large percentage, except where I add five cubic centimeters of bouillon to 100 cc. of water.

Q. Can you make a computation of the additional amount?

A. The bouillon contains about one per cent; less than 7459 one-twentieth gramme I should judge in the case mentioned.

Q. Now how many parts per million would that be?

A. Per million of water, is that the question?

Q. Yes, parts per million?

A. Well, it would be about one-half to the thousand.

Q. And to a million how much?

A. Five hundred.

Q. Then the water would contain how much?

A. Five hundred.

Q. The natural water though, before the bouillon was added—how much would the natural water contain before the bouillon was added?

A. That would depend upon circumstances. I think a great deal less than that.

Q. A great deal less than 500?

A. Oh yes.

Q. So then you would have to increase it many times, would you not?

A. Yes.

Q. Now professor, wouldn't this greatly increased percentage of organic matter materially influence the life of the germ?

A. That would depend upon the other bacteria present and the temperature.

Q. It would, or it might?

7460 A. No, it would.

Q. What kind of other bacteria?

A. Saprophytes, sewage bacteria would multiply more rapidly when there was much organic material, than if there was little organic material.

Q. Then if the saprophytes would multiply more rapidly, wouldn't that also influence materially the life of the typhoid germ which you state is destroyed by the saprophytes?

A. It would, but these conditions do not exist in my experiments. In my experiments I added merely small quantities, inappreciable quantities of typhoid bacilli to the water. For instance one or more loopfuls of typhoid bouillon were added to the water so that the amount of organic matter added to the water in this way was not appreciable in amount.

Q. Now then in what way did you determine the amount of organic matter that you had?

A. I didn't determine the amount of organic matter.

Q. Well then, how do you know that it was inappreciable?

A. I know by the original bouillon culture, only containing about one per cent of organic matter,—about that, and if I use of this original culture only one loopful and add that to water, that would be an inappreciable amount of organic matter that I have added to the water.

7461 Q. Well now, that was the way that you determined the life of the typhoid germ in the Illinois river water, is it?

A. Yes, and in lake water.

Q. Now then, in those determinations, what quantity of Illinois water did you use in making the determination of the life of the typhoid bacilli in that water?

A. We took usually about five cubic centimeters of the water into a sterilized test tube, and added,—for the first experiment, one platinum loopful of a 24 hour bouillon culture of typhoid bacilli that had been grown at 37 degrees centigrade, and this was then plated out.

Q. Then the increased organic matter in the bouillon must necessarily have had a great effect upon the multiplication of these saprophytic germs?

A. No, there was no chance for that. To explain: I first make a bouillon culture of typhoid bacilli. I grow that for 24 hours in the incubator, and of this bouillon culture of typhoid bacilli I take one loopful and add it to five cubic centimeters of river water. After that has been added this is immediately plated out on agar. These bacilli do not grow or multiply to

any extent in the water because I immediately plate out the mixture and the bacteria cannot multiply before being
7462 plated out.

Q. Now then, professor, does that determine the life of the typhoid bacillus in that water?

A. Well, that is done as a control experiment and is the way we start. In the following experiments we do not plate out until the typhoid bacilli have been in the water for one day, for two days, for three days, for four days and so on, until we do not find any more typhoid bacilli in the plates.

Q. Now what is plated out one, two, three, four and five days?

Q. The river water, to which has been added a loopful of the bouillon culture of the typhoid bacillus.

Q. Which contains an increased amount of organic matter and which produces this saprophytic growth?

A. Yes, an inappreciable amount of organic matter.

Q. But isn't that true?

A. Yes.

Q. And the saprophytic growth under your testimony in chief, brings about the death and destruction of the typhoid bacilli?

A. Yes, but the organic material which I have added by one platinum loopful of bouillon culture is inappreciable compared to the amount of organic material which must already be present in that water.

7463 Q. Now you stated a moment ago that that was about how much?

A. In the bouillon I stated it was one per cent.

Q. But you have not computed and have not measured it?

A. I have not in the water.

Q. And therefore do not know?

A. In the water, I don't know.

Q. And to that extent the experiments that you made are not representative of the true characteristics of the Illinois river water which you examined, with reference to the longevity of the typhoid germ in that water?

A. In that respect I will answer that the addition—

Q. Yes or no, professor?

MR. TODD: I object.

MR. JEFFRIES: He can explain afterwards. That question is capable of an answer "yes" or "no," and he may make any such explanation as he may desire afterwards.

MR. TODD: I submit that he can answer it any way he wants to.

MR. JEFFRIES: I submit that under all rules of evidence, that we have a right to demand an answer of the witness, Yes or No.

MR. TODD: I submit that you have not. The witness can answer it in any way that he thinks proper.

MR. JEFFRIES: Mr. Commissioner, I insist on his answering Yes or No.

7464 MR. TODD: The Commissioner has no power to enforce any such demand.

(Question read.)

MR. TODD: I submit that the question is not a question that ought to be answered Yes or No, or that you have any right to demand an answer "Yes" or "No," because the witness says he cannot.
